I.—Of igneous origin.

A. Eruptive masses of non-metaliferous rock.
B. Basic segregations from fused and cooling magmas.
C. Deposits produced in contact metamorphism, most commonly by the action of intrusive masses on limestones.
D. Pegmatites.

II.—Precipitated from Solution.

A. Surface deposits.
B. Impregnations in naturally open-textured rocks.
C. Impregnations and replacements of naturally soluble rocks.
D. Deposits along broken anticlinal summits and in synclinal troughs.
E. Deposits in shear zones.
F. Deposits in faults.
G. Deposits in volcanic necks.

III.—Deposited from Suspension.

A. Placers.
B. Residual deposits.

IV.—Carbonaceous Deposits from Vegetation.

I. Of igneous origin.—A. Eruptive Masses of Non-Metaliferous Rock.—A number of the more common classifications are based on the assumption that the rocks are of igneous origin, building stone being the chief. Granites, syenites, and other light-coloured rocks are the most important. These rocks occur as intrusive masses called bosses when of limited extent and dikes when of vast, irregular area. The main point of importance is the jointing and cleavage, which should in each case yield blocks as nearly rectangular as possible so as to save tool treatment. Dark, basic igneous rocks in dikes, sills and lavas are employed for maccadam, and are often of excellent quality for this purpose.

B. Basic Segregations from Fused and Cooling Magmas.—A number of ore-bodies, of which the best-known involve iron, are believed to result from the cooling of molten masses, which precipitate metals and crystals. Thus magnetite, one of the common iron ores, is a widely distributed component in the eruptive rocks, rarely if ever falling in any variety. It is one of the first minerals to crystallize, and it is found in a crystal form, which is called from 1 to over 100%. These ores are at present of little commercial value because of the difficulties of treating titaniferous varieties in the modern blast furnace practices; but there is little doubt that in the near future they will be extensively mined.

Non-titaniferous magnetites, which often form lenses in gneissoid rocks of more acidic character than those with which the titaniferous are associated, are likewise believed by some observers to be of igneous origin. But others are equally positive believers in sedimentary deposition followed by metamorphism.

Besides magnetite, chrome is a characteristically igneous mineral and is always found in the richly magnesium rocks. Whether the relatively large masses which appear in serpentine are direct crystallizations from fusion, or whether they have segregated from a finely disseminated condition during the change of the original eruptive to serpentine, is a matter of dispute, but the general trend of later opinion is toward an original igneous origin. Although no strictly

chalcocitic silica, deposited around grains of sand. The most extensive of all ore-beds of this type and the mainstay of the German and Belgian smelting industry, are the Jurassic ores, locally called minette, of Luxembourg and the neighbouring territories. Three primary ore-beds are known, and, in the Medius Line, furnish a product ranging from 30 to 40% of iron and between 1 and 2% of phosphoric oxide (P₂O₅). They are generally believed to have been deposited on the bottoms of embayments of the Jurassic sea. There is general agreement that the deposits of this type were precipitated, according to Van Werwegen, as silicate, carbonato-silicate, and as several forms of oxide. More than two billions of tons are believed to be available. Very similar deposits occur in the Ch_crease of the United States.

In the presence of much organic matter which creates reducing conditions, concretions and even beds of spatic ore or black-band may result and afford ores of this type extensively utilized in the Seventeenth century and formerly of some importance in the eastern United States.

The brown hematomites often have more or less manganese, and manganese ores themselves may result by closely related reactions, similar to those of the chalchocitic types. Aluminum is yielded by deposits of bauxite, the hydrated oxide, which in the states of Georgia and Alabama, of the United States, are the result of surface precipitations. In the depths it is believed they are precipitated as sulphate, which is a difficult process, but chiefly important in casting light on the processes of vein formation in the depths.

Non-metallic minerals which are deposited from solution on the surface of the earth are the salines, rock-salt, related potassium salts, gypsum, and the.rarer nitrates. The alkaline chlorides and gypsum are derived, in nearly all cases, from impounded bodies of sea-water, which, exposed to evaporation with or without constant renewal, have left by evaporation the rocksalt. As the fresh waters of estuaries cut off from the sea, it may be by the sudden rising of a bar during a heavy storm or brines impounded in deep bays with a shallow connexions as in the “bar theory of Ochsenius, have given rise to the brines of the estuaries, in which the salt is extensively mined. The potassium compounds have only been found as yet in large quantities in the Stassfurt region of Germany, and seem to be due to the fact that in this locality the mother-liquors of the rock-salts deposits failed to escape and were pyrite and anhydrous.

The nitrates are chiefly obtained in northern Chile and are the result of the reaction of nitrogenous organic matter, upon alkaline carbonates and under conditions where there is enough but not too much nitric acid.

Another very important mineral found in surface deposits from solution is asphalt. It has happened in various parts of the world, but especially in the island of Trinidad, in the Caribean Sea, and near the Peruvian coast of South America, which has evaporated, and has become oxidized so as to leave a residue of asphalt suitable for street-paving or other purposes. So-calledpitch-hakes are afforded which may be of great commercial value.

B. Impregnations in Other-textured Rocks.—In a number of instances in various parts of the world naturally-occurring rocks have been discovered so richly impregnated with the metallic ores as to be ores. The enriching minerals have been introduced, and the solvent has its effects on the rock because of its natural character, and not because geological movements have opened it. Porous sandstones are one of the most common cases. Deposits of silver ores have been extensively mined in the western United States, in quartz deposits of filonite, and in cerargyrite, which have been precipitated upon fossil leaves, sticks, and in the sandstone itself. Over wide areas in the United States, copper in various minerals has been discovered in sandstone and shales; lead and zinc, in the Triassic sandstones of the Western United States, which have impregnated a volcanic tuff, while at the Boleo mines in Lower California tuffs yield copper ores. In at least two of the great copper mines on Lake Superior the native metal impregnates a conglomerate, which has been followed up, filling the blow-holes with shots and pellets. In the Commmor district between Bonn and Aachen, sandstones of the Triassic Bunter-sandstein contain knots of galena, distributed over wide areas as impregnations. Organic matter is believed to have precipitated the galena by its action in upon percolating solutions of lead.

All these porous rocks have been fed by solutions which have entered along waterways, clearly due to faults or some extensive breaks which have provided introductory conduits. The solutions have then been tapped off from the main passages by the porous rock. They are, therefore, closely connected with faults.

Non-metallic minerals in the form of petroleum and asphalt may also be classified as ore deposits. Many oil wells derive their supplies from lenticular beds of sandstone in the midst of impervious shales, and others, as those in the Mexican fields near Tampico, from volcanic tuffs. Asphalt may also be considered the result of a chemical precipitation, furnishing a natural paving material when crushed, heated and laid. Brines are also yielded by porous strata and supply much of the salt of the world.

C. Deposits and Replacements of Naturally Soluble Rocks. —

Ore-deposits of great importance appear in different regions which can only be interpreted as being formed by the replacement of some or all of a rock with the metallic minerals. The most complete example is the replacement of limestone by pyrite, as in “the Early White Limestone” of Luxemburg. It is, however, the earliest recognized in deposits of this character. More than any other metals their association with limestone is pronounced. The replacements may be found near the supply fissure as in the great zinc deposits near Aachen, or the supply fissures may be elsewhere. In the London Coalfield, for example, along the lime-stone, they are often close along it contact with some relatively impervious stratum, which parts seem to have directed the circulations, partly to have checked or stagnated them, while precipitated the pyrites in the limestone. Sulphide and chalcostite are commonly associated in greater or less degree, the copper increasing locally. All the sulphides are exposed to oxidation above the ground-waters and mining in the upper layers has only been directed against the carbonate and sulphate of lead, or the mingled carbonate and hydrated silicate of zinc.

A non-metallic deposit formed by replacement and of much scientific interest is furnished by sulphur when derived from gypsum, and the sulphates of other bases, as seen in those which furnish the so-called "gash veins" which have been worked for many years. The crevices are not all vertical, but often run horizontally and are due to the parting and buckling of individual beds. The results have been called the "sink or set" to denote the way in which the stratum, and are believed to have been formed by the infiltration of galena, blende and pyrite from overlying formations.

When strata are stiff enough to buckle under violent folding and parting, a cleft or fissure, as the result of which the stratum afterwards become filled, it will resemble the "saddle-reefs" so remarkably illustrated in the gold veins of Victoria, Australia, and in pitching anticlines of a much larger character in Nova Scotia. The great ore bodies of the Lake Superior region, now the most productive of all the iron-mining districts, in a series of sedimentary formations, generally of Huronian age, and with associated eruptives, the great mass consisting of a great range of iron carbonate, which are probably originally marine deposits akin to glauconite. They rest upon relatively impervious rocks, and are often penetrated by basaltic dikes. The entire series has been folded, so that the cherty zones of the strata have been buckled and have, by this means, been thrust out of their beds. The strata are now, therefore, of relatively tight, impervious rocks. The descending surface waters have next altered them, have taken the iron into solution, and have redeposited it in the strata as a slightly hydrated red substance. The sand or silt layers, therefore, have been left as the chief cause of these alluvial, or so-called "gash veins," which are joined to the "saddle-reefs" by the fact that storage cavities are afforded. In the most productive oifelds it is the general experience to find the oil and gas impounded in porous rocks, either sandstones or limestones, and in the shales which do not shatter or crack with gentle folding.

E. Deposits in Shear-Zones.—It sometimes happens both in massive rocks and in sediments that strains of compression have been caused by local crushing along comparatively narrow zones without appreciable or measurable displacement of the sides such as would be required by a pronounced fault. The word shear-zone has become quite widely used in recent years as a descriptive term applicable to these cases.
The gold-bearing reefs of the Transvaal present a good illustration. Beds of conglomerate consisting chiefly of quartz and quartzite pebbles have experienced crushing and shattering, and have had their natural porosity much enhanced by these after-effects. Solutions of gold, coming through, have encountered porous rock and have had the gold precipitated upon the pyrites, which is itself often broken and granulated. In other regions shearing has led to sheeting and opening of the rocks by many parallel cracks but almost always with such marked displacement that the next type may very often be described as a series of fault walls. The recognition of this is a fundamental necessity in the study of the mineralogy of the ore. A series of such walls is a normal transition to the fault and closely related to it.

F. Deposits in Faults.—This type of ore-body was one of the earliest established, and has always figured prominently in the literature of mining students of the subject. A fault zone is the ideal type from the point of view of our knowledge. The dialcation of the earth’s crust by faults has furnished either clean-cut fissure or else lines of closely set parallel fractures, which combined displacement has been comparatively great. The fault walls have been worked up, and they furnish therefore waterways of extended character, which may reach from regions of heat and pressure in depth to regions of cold and diminishing pressure above; thus from conditions favourable to mineral deposition below to conditions favouring vigorous pyro- and hydrothermal conditions, the surface. Faults often occur, moreover, in connexion with eruptive outbreaks, and therefore in circumstances especially favourable to ore deposition. From all these reasons it is not surprising that the “true fissure ore” of the world has been the ideal of the prospector’s search in many parts of the world, and has often been his reward. The historic veins of Cornwall and of Saxony are of this type, also the great silver veins of Mexico, the gold veins of California, the great silver-gold deposits of the Comstock lode, and many others. Faulting often leads to great shattering of the country rock, and instead of being a clean-cut open cavity, there results a brecciated belt which may then be cemented by infiltrating ore and gangue. In this brecciated belt are cemented the fragments of the country rock which are succeeded by leaner stretches. The movement of the walls produces the polished surfaces specifically called “slickensides,” parallel to which the other places in the resulting ore bands can be related, and one may throw or heave another, according to the mechanics of faulting as set forth under the article on GEOLGY.

While fault-fissures have in no way failed in later years to be apprehended as a source of gold, in works of disruption, time to time gives a banded character to the deposit, so that from both walls toward the centre the ore is of different value, and of different kind one to another. At the centre the last layers may meet as interlocking crystals in the familiar comb-in-comb configuration, or the metal in cavities called “veins” into which beautiful and perfectly formed crystals project (see fig.). Fault fissures swell and pinch afford wide and irregularly spaced mineralizations.

A very peculiar non-metallic deposit found in fault-fissures and imitating the ordinary veins in all essentials is furnished by the asphalts, which are described as asphaltic, in mineralogy as “grahamite,” “albertite,” “sintaiite,” “gilsonite,” &c. Petroleums with asphaltic bases have percolated into fault-fissures and have there deposited on evaporation and oxidation their dissolved burdens. The black asphalts mineralize all the geological relations of a fissure vein and is mined like so much ore.

G. Volcanic Rocks.—A very unusual ore-body is furnished by this type, which is only known to a few instances. In two mines, however, the occurrence is noteworthy. At Fortuna, near Butte, Montana, occur chins of elliptical cross-section filled with rounded boulders, and believed with much reason to be the tubes of small explosive volcanoes. After brief periods of activity they became filled with andesite for uprising heated solutions which filled the interstices with ore.

III. Deposited from Suspension.—The ores which result from this process are all formed upon the surface of the earth and through the action of water. They are strikingly the rounder and weathering of rocks and of the removal of the loose products thus afforded in the ordinary processes of erosion.

A. Placers.—Many useful minerals, including some of a metallic character, are readily resistant to the agents of erosion, which cause the disintegration of the common rocks. Thus magnetite is a mineral present in a minor capacity in all eruptives and in fairly large percentage in many of the basic types. It is proof against protracted exposure to natural reagents, and it is heavy. Becoming fixed by the disintegration of the containing rock it is mingled with the transported materials of running streams, and settles with other heavy minerals wherever the current slackens to a sufficient degree. Concentration may thus ensue and beds of black sand result. If again deposits of loose sand containing more or less magnetite exposed to the surf of the ocean, or along the waves of lakes, a similar sorting action takes place on the beach. The magnetite remains behind while the undertow removes the lighter materials. Iron sands of either of these varieties are usually too rich in titanium to be of commercial value, but with the magnetite in them they are valuable. When weathered they furnish good iron for blast furnaces.

While magnetite is the commonest of the ores to be found in places, gold is the metal which usually gives them value. Wherever systems of drainage have eroded gold-bearing rocks, the gold has thence been washed away, and in many cases of they have been thrown into placer deposits. The gold tends to work its way through the gravels even to the bottom of the stream, and in the process of washing out the clay, and there to be relatively rich. It favours also the insides of bends and the heads of quiet reaches. When a small tributary stream joins a larger one and is both checked itself and checks the current of the larger, as in the Klondike, tends to settle in relatively great abundance.

Many places, strangely enough, or related rock-cavities, often fail to yield the nuggets, apparently because the swiftness of the water and the absence of suitable depositing places. These are washed elsewhere.

When the gold-bearing gravels are piled down a small residue is obtained of all the heavy minerals in the gravel. Magnetite is the commonest and gives the technical name of “black sand” to the drift. They have then been found among the many minor particles of garnet and other less familiar minerals. If the stream valley has been hunted over by sportsmen with shot-guns or rifles, the lost shot and bullets are commonly caught in the pan. Even diamonds have been once noted and they may, indeed, be specially sought in gravels.

Along sea-shores where great beds of auriferous gravel have been attacked by the surf, concentrated bars carrying nuggets and large gold are washed into the sea. These may be in the same way. In some regions of gold-bearing rocks, as in the south-eastern United States, the products of superficial decay of rocks may remain in situ and be sufficiently charged with gold to be washed by the surf. They are different from the usual placer deposits, although hydraulicked in the same way they might possibly be considered residual deposits under the next head.

Auriferous stream-gravels of ancient and long-abandoned systems of drainage may remain beneath lava flows or later sedimentary beds. Both placer deposits and gold are found in Australia, where they are called “deep leads,” and in California, where they are called “buried channels” or “deep gravels,” they have been for many years the objects of mining. In California these streams, as the bed-rock is black, have been distinguished in technical terms have resulted descriptive of the rich streams. The bed-rock is the “slug-rock;” the pay-streaks which appear on its sides, bench-gravels, and the lowest one the “channel-gravel.” Tunnels are bored along the ancient streams, and the hole in the sluice channels and at the same time preserve the proper slope for the discharge and extraction. The buried channels in California have proved of much scientific interest from the surface of the prehistoric alluvial deposits and the later industry which they have yielded.

Among the non-metallic minerals sought from placers, phosphates for fertilizers hold a position of great importance.

B. Residual Deposits.—As contrasted with the placers whose materials are derived by transport from a distance, we sometimes have the sediments which are driven, but are left uneroded, and have been freed by the process of decay and disintegration. The lighter loose materials are washed away and deposited elsewhere. The heavy remain behind in a concentrated condition. Iron ores of the type of iron-bessemer hematite is set free in the same way by the decomposition of serpentine.

In the decay of ferruginous rocks like limestones the iron may be changed to the insoluble ferric hydrate, brown hematite, and remain there. Lignite and bituminous coal also have to be washed by water, in or near which they must grow, and beneath which they must be deposited, so that oxidation may be retarded. In instances they have been hooped together by rivers, especially when at flood. The method of origin is fully discussed under COAL and under
MINERALOGY

MINING, but it may be remarked here that once formed they undergo all the foldings, faultings and disturbances which have affected the sedimentary rocks of other kinds.

BIBLIOGRAPHY.—The following are general works on the deposits of the useful minerals, in addition to Poesny’s volume already mentioned: In English—J. A. Phillips, revised by Henry Louis, Treatise on Ore-Deposits (London, 1896); J. F. Kemp, Ore-Deposits of the United States and Canada (New York, 1900); Prime’s translation of Von Cotta’s Ore-Deposits (New York, 1870); H. Ries, Economic Geology of the United States (New York, 1896); W. H. Weed’s translation of Beck’s The Nature of Ore-Deposits (New York, 1905); Genesis of Ore-Deposits (American Institute of Mining Engineers, 1901); G. F. Morrison, Non-Metallic Minerals (New York, 1904). In Germany—B. von Cotta, Die Lehre von den Ersparlständen (Friedberg, 1859); A. von Groddeck, Die Lehre von den Lagerstätten der Erze (Leipzig, 1879); R. Beck, Lehr von den Ersparlständen (Berlin, 1902); A. W. Weltefeld, and R. Bergetz, Die Ersparlständen (Leipzig, 1898-1906). In French—E. Fuchs and L. de Launay, Traité des gîtes minéraux et métalliferes (Paris, 1893); G. Moreau, Étude industrielle des gîtes métalliferes (Paris, 1894). (J. F. K.)

MINERALOGY, the science which describes and classifies the different kinds of mineral matter constituting the material of the earth’s crust and of those extra-terrestrial bodies called meteorites. The study of minerals is thus a branch of natural history, but one in which certain of the exact sciences find an application. The determination of the composition and constitution of minerals is a chemical problem; their optical and other physical properties are determined according to the principles of physics; the study of their mineral form and crystalline structure belongs to crystallography; their modes of occurrence, origins, associations and changes come within the province of geology and petrology; while a consideration of the localities at which they are found requires some acquaintance with geography. Finally, there is the economic side, dealing with the mining and application of useful minerals, the extraction of metals from their ores, and the uses of minerals for building, decoration, and jewelry.

In this article we shall treat only of the general characters of minerals; their special characters will be found in the articles on the individual minerals.

After a brief historical sketch the subject will be treated under the following headings:—

I. Characters of Minerals.

1. Morphological Characters.
   a. Crystalline Form.

2. Physical Characters.
   a. Optical Characters (Colour, &c.).
   b. Magnetic, Electrical and Thermal Characters.
   c. Characters depending on Cohesion (Hardness, &c.).
   d. Specific Gravity.
   e. Touch, Taste and Smell.

3. Chemical Characters.
   Synthesis of Minerals.

II. Occurrence and Origin of Minerals.
   Alteration of Minerals: Pseudomorphs.

III. Nomenclature and Classification of Minerals.

History.—Owing to their numerous applications for useful and decorative purposes, minerals have attracted the attention of mankind from the earliest times. The stone and bronze implements of prehistoric man and many of his personal ornaments and charms were directly or indirectly of mineral origin. The oldest existing treatise on minerals is that written about 315 B.C. by Theophratus (περὶ τῶν ἔργων—On Stones, English version by John Hill, 1746), of which only a portion is now in existence. Minerals were then classed as metals, stones and earths. The last five books of Pliny’s Historia naturalis, written about A.D. 77, treat of metals, ores, stones and gems. Some of the Arabian philosophers devoted themselves to the study of minerals, and about 1262 Albertus Magnus wrote his De mineralibus. In the 16th century Georgius Agricola published several large volumes, dealing more especially with the mining and metallurgy of metallic ores, in which more exact descriptions were given of the external characters: he mentioned several minerals by names (e.g. blende, fluor, quartz) which are now in common use. About the same period there appeared the systematic treatise on minerals of K. Gesner (1563), and that upon stones by Anselm Boeothius de Boedt (1609). The remarkable researches of Erasmus Bartholinus on Iceland-spar were published in 1669, and J. F. Henckel’s Pyrologia in 1725. Later came the Systema naturae of C. Linné (1735). Although the importance of chemical properties was recognized by the Swedish chemists—J. G. Wellerius (1747) and A. F. Cronstedt (1758)—the external characters of minerals formed the basis of the mixed systems of classification of A. G. Werner (1774) and of other authors, and even as late as the Natural History System of Mineralogy of M. F. Mohs (1820).

It was not until the end of the 18th and beginning of the 19th century, when the foundations of crystallography were laid by Romé de l’Isle and R. J. Haüy, and chemistry had assumed its modern phase, that any real advance was made in scientific mineralogy. It was then recognized that chemical composition and crystalline form were characters of the first importance, and that external (natural history) characters were often less accidental. During this period numerous mineral substances were analyzed by Scheele, Klaproth, Charles Hatchett, Vauquelin, Kirwan, Berzelius, Rose and other chemists, and many new mineral-species and chemical elements discovered. After W. H. Wollaston’s discovery of the chemical properties of gold in 1802, exact measurements of the crystalline forms of many minerals were made. The principles of isomorphism and dimorphism enunciated by E. Mitscherlich in 1810 and 1821 respectively cleared up many difficulties encountered in the definition of mineral-species. About the same time also the discovery by E. L. Malus of the polarization of light gave an impetus to the optical examination, by Sir David Brewster and others, of natural crystals. Later, the investigation of rocks in thin section under the microscope led to the exact determination, particularly by A. Des Cloizeaux (1857), of the optical constants of rock-forming minerals.

For a detailed account of the history of mineralogy (including crystallography), see F. von Kobell, Geschichte der Mineralogie von 1650-1860 (München, 1864). The recent history of mineralogy may be well traced in the six editions of J. D. Dana’s System of Mineralogy (1837-1892).

I.—Characters of Minerals.

A distinction is to be made between essential and non-essential characters. Essential characters are those relating to chemical composition, crystalline form, crystallo-physical properties and specific gravity; these are identical, or vary only within certain defined limits, in all specimens of the same mineral-species. Non-essential characters—such as colour, lustre, hardness, form and structure of aggregates—depend largely on the presence of impurities, or on the state of aggregation of imperfectly formed crystalline individuals. In an absolutely pure and perfectly developed crystal all the characters may be said to be essential, but such crystals are of exceptional occurrence in nature, and certain of the characters are subject to modification under different conditions of growth. For example: a well-formed crystal of haematite (“specular iron ore”), with its smooth black faces and brilliant metallic lustre, is strikingly different in appearance from a piece of massive haematite (“red iron ore”); which, in due time under the influence of certain other conditions, the former is so hard that it can only with difficulty be scratched with a knife, while the latter is quite soft and soils the fingers. Both specimens will, however, be found on analysis to have the same chemical composition (Fe₂O₃), the same crystalline structure (as determined by the optical characters under the microscope in the case of the massive variety), and very nearly the same specific gravity (especially if this be determined upon finely powdered material, the effect of cavities being thus eliminated). The essential characters being identical, the difference between the two specimens lies in the state of aggregation of the material: with “specular iron ore” we have a single crystal, while with the “red iron ore” we are dealing with a confused aggregate of minute crystalline individuals, which have interfered with each other’s growth to such an extent that no crystal-faces have been developed. Such differences do
not therefore depend on the nature of the material, but only on the conditions which prevailed during its growth. (See \textit{Quartz} and \textit{Calcite}.)

In the following enumeration of the more salient characters of minerals it is to be noted that many of the terms used for non-essential characters are purely descriptive and have no exact definition; on the other hand, essential characters can be expressed numerically and are therefore perfectly definite.

1. Morphological Characters.

\textbf{a. Crystalline Form.}—This most important character of minerals can, of course, be determined only when the material available is in the form of crystals (i.e. crystallized), which is not always the case. Massive aggregates of crystalline material are of much more frequent occurrence; when small fragments or thin sections of such material are transparent, the crystalline symmetry may be determined, within certain limits, by the help of the optical characters (see below). External crystalline form must not, however, be considered alone apart from all other characters, for crystals of substances quite different chemically, e.g. silver iodide, zinc oxide and zinc sulphide, are sometimes almost identical in their crystalline form; further, in groups of isomorphously related minerals the degree of symmetry will usually be the same and the angles vary only slightly, and unless the crystals are perfectly developed and suitable for exact goniometric measurement no crystallographic distinction can be made between two such species.

All the six systems of crystals and most of the thirty-two symmetry-classes are represented amongst minerals (see \textit{Crystallography}). Crystals of the same mineral-species may differ very widely in general form or habit; e.g. crystals of calcite (q.v.) may be rhombohedral, prismatic, scalenohedral or tabular in habit. Other descriptive terms of the habit of crystals are pyramidal, accicular or needle-shaped (from the Lat. \textit{acicula}, a needle), capillary or hair-like (from the Lat. \textit{capillus}, hair), &c.; and these peculiarities of habit may sometimes be characteristic of certain minerals. Sometimes also there are characteristic kinds of groupings of crystals: thus parallel, divergent or radiating (e.g. scolinite), rosette-shaped (e.g. haematite—\textit{Eisenrosen}), reticulated (e.g. rutile), or matted. The faces of natural crystals may be smooth, rough, striated, curved or drusy,\footnote{This is from a German word, \textit{druse}, originally meaning "brush," and applied by miners to hollow stones, lined with minute projecting crystals.} i.e. studded with small crystal faces and angles.

\textbf{b. State of Aggregation: Structure.}—According to the particular state of aggregation of a number of imperfectly developed crystals, which have grown together, various kinds of structure may be presented even by the same mineral species. The descriptive terms applied to these structures are almost self-explanatory: thus the structure may be granular (e.g. marble), fibrous (asbestos), radio-fibrous or stellated (wavelite), columnar (beryl), laminar or lamellar (talc), bladed (cynite), &c., according to the relative shape and sizes of the individual crystals composing the aggregate. When the constituent crystals are invisible to the unaided eye the material is described as compact; incoherent aggregates are powdery or earthy. Minerals which are really amorphous, \textit{i.e.} without any crystalline structure, are comparatively few in number (e.g. opal); many which are apparently amorphous are really microcrystalline (e.g. turquoise).

The term massive is often used loosely for a crystalline mineral not showing crystal-faces. Crystal-aggregates often assume more or less accidental and imitative external forms to which the following descriptive terms are applied: dendritic or arborescent (e.g. copper, pyrolusite), mossy (copper), leafy (gold), wiry or filiform (silver), capillary (millerite), coralloïd (aragonite), globular (aragonite, with concentric structure; wavelite, with radiated structure), mamillary or with breast-like protuberances (arsenic), nodular (malachite), warty (menilite), botryoidal or resembling a bunch of grapes (from \textit{bòrus}, a bunch of grapes) (dolomite), reniform or kidney-shaped (menilite), amygdaloidal or almond-shaped (agate), stalactitic (calcite, chalcedony), &c.

\textit{a. Optical Characters.}—The action of crystallized matter on transmitted light is a character of the highest importance in mineralogy. Even when the substance is opaque in large masses, it may be sufficiently transparent when in small splinters or in thin sections for the determination of the optical characters. The refractive indices, strength of the double refraction, optic axial angle, extinction angles on certain faces, &c., are characters capable of exact measurement and numerical expression, and are constant for each mineral-species. (See \textit{Crystallography}.)

In their "diaphanocity," or degree of transparency, minerals differ very widely even in the same species. Some, such as metals and most metallic sulphides are always opaque; while others may vary in different specimens from perfect transparency to perfect opacity (in the latter case, however, minute fragments will, as a rule, still be transparent). A good example of this is afforded by the varieties of quartz: rock-crystal is water-clear, chalcedony is translucent, and Jasper opaque.

The "colour" of minerals is the character which first arrested attention; but being a character which may vary almost indefinitely in one and the same kind of mineral, it affords a typical example of a non-essential character. Thus, fluor-spar and quartz, when in well-formed and chemically pure crystals, are quite colourless and transparent; but it would be easy to collect a series of each of these minerals in which almost every shade of colour is represented. Crystals of fluor-spar of an emerald-green, purple, golden-yellow, bright pink or other colour are at first sight very different in appearance, and yet the difference is due solely to the presence of traces of colouring matters so small in amount that their exact nature is difficult or impossible to determine. The value of diamond, corundum and other gemstones depends largely on these accidental differences in colour.

Such substances, which are essentially colourless and owe their colour to the presence of colouring matter as an impurity, are said to be "allochromatic": any colour they may possess is non-essential. In some other substances, known as "idiochromatic," the colour is a definite and essential character; for example, the yellow colour of gold, the red of cinnabar, &c.; but even here, owing to differences in the state of aggregation and the presence of various impurities, they may be wide variations in colour.

Colour is thus a character of little determinative value, especially in minerals which are allochromatic; but it is sometimes a useful guide when taken in conjunction with other characters. An elaborate list of colour-names for descriptive use was drawn up by A. G. Werner in 1774.

An important character of transparent crystals is that of unequal absorption in different directions; so that light will, as a rule, be differently coloured according to the direction in which it has travelled through the crystal: this is known as dichroism or pleochroism (see \textit{Crystallography}). Certain minerals (e.g. zircon, amoldite and those containing cerium) when examined with a spectroscope by transmitted light exhibit characteristic absorption spectra.

The colours of minerals may also be due to the interference of rays of white light at the surfaces of thin crevices or minute inclusions, either tubular or fibrous in form, in the mineral; for example, the play of colours of opal; the change of colours of labradorite; the bands of rainbow colours (Newton's rings) seen along cleavage cracks and irregular internal fractures (e.g. in quartz); the iridescent tarnish due to a superficial film of a decomposition product (e.g. "peacock copper ore"); or the bluish opalescence of moon-stone and cat's-eye.

The true colour of a mineral is best revealed by its "streak," \textit{i.e.} the colour of its powder. This is obtained by scratching the mineral, or by crushing a fragment of it on a sheet of white paper, or rubbing it upon unglazed porcelain. The streak of allochromatic minerals is white, while that of idiochromatic minerals is coloured and is often of determinative value. Ores of iron may, for example, generally be distinguished by their streaks: that of magnetite being black; haematite, blood-red;
limonite, yellow; and chalcybite, white. The streak of a mineral may be either shining (e.g. argentite) or dull.

Another character depending on light is that of lustre, which is often very characteristic in certain minerals, though it may be considerably modified by the state of aggregation. For example, the usual adamantine lustre of diamond is not exhibited by the compact aggregate known as carbonado; while earthy masses of any mineral will be devoid of lustre. Descriptive terms applied to the kinds of lustre are: metallic (e.g. pyrites), adamantine (diamond), vitreous (quartz), resinous (pyromorphite), greasy (elaeolite), waxy (chalcedony), pearly (talc, heulandite and other minerals with a perfect cleavage), silky (satin-spar), &c. The degrees of intensity of lustre are described as splendid, shining, glistering, glimmering and dull, and depend usually on the smoothness of the crystal-faces.

The phenomena of phosphorescence (g.e.), fluorescence (g.e.) and radio-activity (g.e.) are strikingly exhibited by some minerals. (See Fluor-spar, Diamond, &c.)

b. Magnetic, Electrical and Thermal Characters.—These, as far as related to crystalline form, are discussed under crystallography (g.e.). Magnetite ("loede-stone") is the only mineral which is strongly magnetic with polarity; a few others, such as pyrrhotite and native platinum, possess a character to this much less degree. Many minerals are, however, attracted by the pole of a strong electro-magnet, while a few (diamagnetic) are repelled.

Most minerals with a metallic lustre are good conductors of heat and electricity; others are bad conductors. For example, graphite is a good conductor, while diamond is a bad conductor. Non-conductors of electricity become electrified by friction, some positively (e.g. quartz and topaz), others negatively (e.g. sulphur and amber). The length of time during which different gem-stones retain their charge of frictional electricity was made use of by R. J. Haüy as a determinative character. For the pyro-electrical and thermo-electrical characters of crystals see Crystallography. Some minerals—for example, salt, sylvinite and blende—are highly diathermanous, i.e. transparent for heat-rays.

The specific heat and melting point of minerals are essential characters capable of exact measurement and numerical expression, but they are not often made use of. Different minerals differ widely in their "fusibility": the following scale of fusibility was proposed by F. von Kobell:

1. Stibnite . (525° C.) 5. Orthoclase . (1175° C.)
3. Almandite . (1265° C.) 7. Quartz . (1430° C.)

The melting points given above in parentheses were determined by J. Joly. Stibnite readily fuses to a globule in a candle-flame, while quartz is fusible even on the thinnest edges before the ordinary blowpipe.

c. Characters depending on Cohesion.—Some minerals (e.g. a sheet of mica) are highly elastic, springing back to their original shape after being bent. Others (e.g. talc) may be readily bent, but spring back to their original form when released; these are said to be pliable or flexible. Sectile minerals (e.g. chlorargyrite) may be cut with a knife without being fractured; related characters are malleability (e.g. argentite) and ductility (e.g. silver). The tenacity, or degree of fragility of different minerals varies widely: they may be brittle, tough, soft or friable. The fractured surface produced when a mineral is broken is called the "fracture," and the kind of fracture is often of determinative value; descriptive terms are: conchoidal (e.g. quartz, which may often be recognized by its glassy conchoidal fracture), sub-conchoidal, uneven, even, splintery (e.g. jade), hackly or with short sharp points (e.g. copper), &c.

In many cases when a crystallized mineral is broken it separates in certain definite directions along plane surfaces. This property of "cleavage" (see Crystallography) is an important essential character of minerals, and one which is often of considerable assistance in their recognition. For example, calcite, with its three directions of perfect cleavage parallel to the faces of a rhombohedron, may always be readily distinguished from aragonite or quartz; or again, the perfect cubic cleavage of galena renders this mineral always easy of recognition.

"Hardness," or the resistance which a substance offers to being scratched by a harder body, is an important character of minerals, and being a test readily applied it is frequently made use of. It must, however, be remembered that the hardness of an incoherent or earthy aggregate of small crystals will be very different from that of a single crystal. A comparative "scale of hardness" was devised by F. Mohs in 1820 for the purpose of giving a numerical statement of the hardness of minerals.

Mohs's Scale of Hardness.

1. Talc . 6. Orthoclase.
2. Gypsum . 7. Calcite.

These minerals, arbitrarily selected for standards, are successively harder from the softest, to diamond the hardest of all minerals: a piece of talc is readily scratched by gypsum, and so on throughout the scale. A mineral which is capable of scratching calcite and itself is as easily scratched by fluor-spar is said to have a hardness of 33. Some care is required to avoid error in the determination of hardness: it is best to select a smooth crystal-face, cleavage-surface or fracture on which to rub a sharp corner of the scratching mineral; the powder should be wiped off and the surface examined with a lens to see if a scratch has really been produced or only powder rubbed off the corner of the mineral with which the scratching was attempted. With a little practice a fair idea of the hardness of a mineral may be obtained with the use of a knife or file, which will scratch all minerals with a hardness of 6 or less. Thus iron-pyrites (H. = 6) and copper-pyrites (H. = 3), apatite (H. = 5) and beryl (H. = 7), or gem-stones and their paste imitations may be readily distinguished by this test. Talc and gypsum can be readily scratched with the finger-nail.

Planes of parting, etching figures, pressure- and percussion-figures are sometimes characters of importance in describing and distinguishing minerals. (See Crystallography.)

d. Specific Gravity.—The density or specific gravity of minerals is an essential character of considerable determinative value. In minerals of constant composition it has a definite value, but in isomorphous groups it varies with the composition: it also, of course, varies with the purity of the material. It is a character which has the advantage of numerical expression: minerals range in specific gravity from 1.01 for copalite to 22.84 for iridium. The exact determination of the specific gravity of minerals is therefore a matter of some importance. Three methods are in common use, viz. hydrostatic weighing, the pycnometer, and the use of heavy liquids. The first two methods are only applicable when a weighable amount of pure material can be selected or picked out; this is, however, generally a laborious operation, since impurities are often present and usually several species of minerals are closely associated, and in selecting a specimen it is often necessary to determine some other character to make certain that only one kind is being selected. For exact determinations the pycnometer method is usually to be recommended, using for material the pure fragments which have been selected for quantitative chemical analysis. With a single pure crystal or a faceted gem-stone the method of hydrostatic weighing is usually applicable, providing the stone is not too small. The most ready method, however, is that afforded by the use of a heavy liquid, and the most convenient liquid for this purpose is methylene iodide. This is a clear, mobile liquid with a specific gravity of 3.33, and by the addition of benzene, drop by drop, the specific gravity may be reduced to any desired amount. With such a liquid the specific gravity of the minutest fragment, the purity of which has previously been scrutinized under the microscope, may be rapidly determined. The liquid is diluted with benzene until the fragment just remains suspended, neither floating nor sinking; the specific gravity of the fragment will then be the same as that of the liquid, and the latter may be determined by hydrostatic weighing or, more conveniently, by
mechanism of indicators. Small recognizable crystallites of the following minerals may be kept at hand as a set of indicators: gypsum (sp. gr. 2.32), colemanite (2.42), orthoclase (2.56), quartz (2.65), calcite (2.72), aragonite (2.93), rubellite (3.02), apatite (3.20), diopside (3.32), &c. With a series of tubes containing mixtures of methylene iodide and benzene of different densities and suitable indicators, specific gravities may be rapidly and accurately determined. Values intermediate between those of the indicators may be estimated by a diffusion column of the liquid, or by noting the rate at which the benzene evaporates and the specific gravity of the liquid increases. For use with minerals of specific gravity greater than 3.33 various other heavy liquids have been suggested; the best being thallium silver nitrate (TlAg(NO₃)₂), which melts at 75° C. to a clear liquid with a density of 4.8, and is miscible with water.

e. Touch, Taste and Smell.—In their action on the senses of touch, taste and smell a few minerals possess distinctive characteristics. Talc is moussey or soapy to the touch; tripolite and trachyte are respectively meagre and harsh. Some porous minerals (e.g. clays and hydronopen) adhere to the tongue. Gem-stones may often be distinguished from their glass imitation by the fact that they feel colder, since they are better conductors of heat. Bitumen and clays, when moistened, have a characteristic smell; pyrites and some other sulphides when rubbed emit a sulphurous odour. Minerals which are soluble in water have taste: e.g. saline (salt), alkaline (natron), bitter (epsmite), astringent (chalcanthite), &c.

3. Chemical Characteristics.

Chemical composition is the most important character of minerals, and on it all modern systems of classification are based. A mineral-species cannot, however, be defined by chemical composition alone, since many instances are known in which the same chemical element or compound is dimorphous or polymorphous (see Crystallography). Thus both the minerals diamond and graphite consist of the element carbon; both calcite and aragonite consist of calcium carbonate; and rutile, anatase and brookite consist of titanium dioxide. In such cases a knowledge of some other essential character, preferably the crystalline form, is necessary, before the mineral can be determined.

All the known chemical elements have been found in minerals; and of many of them minerals are the only source. On the other hand, nitrogen, which is frequently present in organic substances, is rare in minerals; carbon has a wide distribution in mineral carbonates. It is estimated that the minerals of the earth’s crust consist of about 47% by weight of oxygen, 27 of silicon and 8 of aluminium; silicates, and especially aluminium-silicates, therefore predominate, these being the more important rock-forming minerals.

The chemical composition of minerals is determined by the ordinary methods of analytical chemistry. Since, however, minerals of different kinds usually occur intimately associated, it is often a matter of some difficulty to select a sufficiency of pure material for analysis. For this reason the exact composition and the empirical formula of several minerals, particularly amongst the silicates, still remain doubtful. There are even cases on record in which the chemical composition and the crystalline form have been determined on different materials in the belief that they were the same. Whenever possible, therefore, the chemical analysis should be made on small pure crystals which have been previously determined crystallographically.

For the qualitative chemical examination of minerals, when only a small amount of material is available, the methods of blowpipe analysis and microchemical analysis are often convenient. (See G. J. Brush, Manual of Determinative Mineralogy, 16th ed., by S. L. Penfield, New York, 1903; H. Behrens, Manual of Microscopic Analysis, London, 1894.)

The principle of isomorphism (see Crystallography) is of the highest importance in mineralogy, and on it the classification of minerals largely depends. In some minerals (e.g. quartz) isomorphous or vicarious replacement is not known to occur; but in the majority of minerals one or other of the predominating elements (generally the base, rarely that of the acid radiicle) may be isomorphously replaced by equivalent amounts of other chemically-related elements. In some isomorphous groups of minerals replacement takes place to only a limited extent, and the element which is partly replaced always predominates; while in other groups the replacement may be indefinite in extent, and between the ends of the series the different members may vary indefinitely in composition, with no sharp demarcation between species. Thus in the group of rhombohedral carbonates the different species are usually sharply defined. In well-formed crystals of calcite the calcium is replaced by only small amounts of magnesium, iron, lead, &c.; in chalcopyrite, however, iron is often largely replaced by calcium, magnesium, manganese, &c., and the “brown spar” is not always distinctly distinguishable. In the dimorphous group of orthorhombic carbonates isomorphous replacement is less frequent, and the different species (aragonite, cerusaite, &c.) are quite sharply defined. In other groups of minerals, particularly amongst the silicates, isomorphous replacement of the basic elements is so general that the several members of the series vary almost indefinitely in chemical composition, and will scarcely be the same for any two specimens, though it may be reduced to the same type of formula. For example, the formula of all varieties of garnet may be expressed generally as R₃[R’₁₂]₂(SiO₄)₃, where R’₂ = Ca, Mg, Fe, Mn, and R’₃ = Al, Fe, Mn, Cr, Ti. Tourmaline affords another good example. In the plagioclase feldspars (see Plagioclase) we have an example of the isomorphous mixing of two endmembers, albite (NaAlSi₃O₈) and anorthite (Ca₂Al₂Si₂O₈) in all proportions and with no sharp line between the several subspecies. In some other cases the end-members of the series are purely hypothetical: e.g. in the scapolite group (mixtures of Ca₂Al₂Si₂O₈ and Na₂Al₂Si₂O₆Cl) and in the micas and chlorites. In such instances, where the formulae of the two end-members can be defined, the “mass effect” may have some influence on the isomorphism.

In addition to isomorphous series, there are amongst minerals several instances of double salts, which contain the same constituents as the members of isomorphous series: e.g. dolomite (q.v.) and barytoalcite (q.v.).

The manner in which water enters into the composition of minerals is often difficult to determine. In some cases, e.g. in the zeolites (q.v.), it is readily expelled at a low temperature, even at the ordinary temperature over sulphuric acid, and may be reabsorbed from a moist atmosphere or replaced by some other substances: it is then regarded as “water of crystallization.” In other cases, when expelled only at a higher temperature, it is to be regarded as “water of constitution,” forming either a basic salt (e.g. malachite, Cu(OH)₂CO₃) or an acid salt (e.g. diopside, H₂CuSiO₄) and mica, q.e.v. When present as hydroxyl it is often isomorphously replaced by fluorine (e.g. chlorite, [Al₂(F,OH)₂]SiO₄). Sometimes the water is partly water of crystallization and partly water of constitution.

As to the actual chemical constitution of minerals the little that is at present known is mainly speculative. Dimorphous minerals, which have the same empirical formula may be expected to differ in constitution; and experiments have been made, for example on pyrites and marcasite, with the object of discovering a difference, but the conclusions of various investigators are not in agreement. More promising results have been obtained (by F. W. Clarke and others) by the action of various reagents on silicates, particularly on the more readily decomposed zeolites, and several substitution-derivatives have been prepared.

Synthesis of Minerals.—The production of minerals by artificial means is a branch of chemical mineralogy which has been pursued with considerable success, especially by French chemists. Most minerals have been obtained artificially in a crystallized condition, and many related compounds, not as yet in nature, have also been prepared. Crystals of artificially prepared minerals, though usually quite small in size, possess all the essential characters of natural crystals, differing from these only in origin. The following are the principles of some of the
Those rather primary present micas magma, be rock-cavities direction nickel-bearing (e.g. as have effects magmas. either action more methods pneumatolytic Minerals accessory; well instance, ruby deposits, high have their partly before (pegmatites) of important cassiterite, important perchlorate, xvin.Origin nickel-bearing important peridotite) and nickel-bearing minerals. For example, the quartz, calcite, barytes, fluor-spar, being gangue minerals. By the weathering of the metallic minerals of mineral-veins numerous other finely crystallized minerals result: for example, in the upper oxidized portion of veins containing-silica-gneissicandalus, sericite and pyromorphite are often met with; in veins of copper-ore the alteration of chalcopyrite gives rise to malachite, chrysollite and cuprite.

delivered: simple sublimation (e.g. arseno-
lite); interaction of gases (e.g. haematite, from steam and ferric chloride; cassiterite, from steam and stannic chloride or fluorite; action of gases on liquids and solids; slow cooling of fused masses, either with or without the presence of agents mineralisateurs (e.g. minerals in furnace slags); from aqueous solution sometimes at a high temperature and under pressure (e.g. quartz); electrolysis; or even by subjecting dry amorphous material to enormous pressure. The chemical reactions by which various minerals have been obtained are often of considerable help in speculating as to their mode of origin in nature, though it must be born in mind that the same mineral may have been formed, both naturally and artificially, by more methods than one. In this direction important results have been obtained experimentally by J. H. van't Hoff and his pupils on the formation of oceanic salt deposits, and by J. H. V. Vogt with slags. Many minerals used as gem-stones have been prepared artificially, e.g. diamond and ruby (see Gems: Artificial).

II.—Occurrence and Origin of Minerals.

While some minerals are of rare and sporadic occurrence in rock-cavities and mineral-veins, others are widely distributed as important constituents of rocks. The same mineral species may have several distinct modes of occurrence and origin, and be associated with different minerals in each case; facts which are well illustrated by quartz (q.v.).

Minerals of Igneous Rocks.—The rock-forming minerals of primary origin in igneous rocks have crystallized out from the magma, or fused silicate-mass, which on consolidation gave rise to the rock-mass. Magmae sometimes contain a considerable amount of water and are then in a state of aqueo-igneous fusion, rather than of dry fusion: in such cases very coarsely crystalline rocks (pegmatites) often result, and under these conditions minerals of many kinds are formed as well-developed crystals. The minerals which are present in large amount in igneous rocks are distinguished as essential constituents, since it is on these that the classification of igneous rocks is largely based: the most important are quartz, felspars, pyroxenes, amphiboles, micas and olivines. Felspars of different composition are present in almost all kinds of igneous rocks, while quartz and olivine are characteristic of acid (e.g. granite, rhyolite) and basic (e.g. basalt, peridotite) rocks respectively. When the magma contains alkalis in relatively large amount the "felspathoid" minerals, nepheline and leucite, are formed (e.g. in nepheline-syenite, leucite-basalt, &c.). Other minerals occurring as primary constituents, but only in small amounts, are distinguished as accessory; thus small crystals of magnetite, apatite, zircon, &c., are of frequent occurrence disseminated in igneous rocks (see Petrology). Sometimes these accessory constituents are concentrated by magmatic differentiation, important ore-deposits sometimes resulting in this manner (e.g. of chromeite, or nickel-bearing pyrrhotite). The alteration of igneous rocks by weathering and other processes results in the alteration of some or all of the primary minerals with the production of others, which are spoken of as secondary minerals: thus felspars are often partly or wholly altered to kaolin, olivine to serpentine, pyroxene and mica to epidote, chlorite, &c.

Minerals are also formed by the vapours given off by igneous magmas. The gases emitted by volcanoes and sulphurless may deposit directly by sublimation, or by their chemical interaction, such minerals as sulphur, sal-ammoniac, haematite, which occur, for instance, as incrustations on Vesuvian lava: the boric acid of the Tuscan lagoons has also originated in this way. The effects produced by the exhalations of deep-seated magmas are more complex in character, since the vapours, being more confined, have more opportunity of acting chemically not only on the surrounding rocks but also on the igneous rock-mass itself before its final consolidation. A good example of the "pneumatolysis" action produced by the vapours from a mass of granitic magma is afforded by veins of tin-ore, in which the ore (cassiterite) is associated with minerals containing boron and fluorine, such as topaz, tourmaline, lepidolite, fluor-apatite and fluor-spar. The production of such minerals may be accounted for by assuming the presence of stannic fluoride in the vapours, which, by reacting on water vapour would deposit cassiterite with the liberation of hydrofluoric acid, and this would again react on other minerals. The topaz and tourmaline crystals often found in the cavities of granites and pegmatites have doubtless been formed in this manner. In a similar way the exhalations of basic magmas have given rise to chlor-apatite with associated sphene and ilmenite, as, for example, in the extensive apatite veins in connexion with gabbro in southern Norway.

Minerals of Metamorphic Rocks.—By the baking action of a deep-seated igneous mass on the surrounding rocks or on included rock-fragments, various new minerals are developed. By this process of thermal or contact-metamorphism well-crystallized examples of many minerals have often been formed; e.g. in calcareous rocks (limestones), especially those containing some magnesia and silica, vesuvianite, garnet, diopside, tremolite, wollastonite, &c., are developed; in argillaceous rocks (slates), chloriaste and staurolite are characteristic products; and in arenaceous rocks (sandstones), cordierite and sillimanite often result. The effects of pressure (dynamo-metamorphism) on rocks of various kinds, especially those of igneous origin, also result in the production of new minerals: e.g. pyroxene is transformed to amphibole, orthoclase to muscovite, plagioclase to zoisite, olivine to tremolite, &c. In gneisses and crystalline schists, quartz, felspars, mica, talc, amphibole, &c. are important constituents.

Minerals of Sedimentary Rocks.—By the weathering and disintegration of igneous and metamorphic rocks the various minerals set free and the products of decomposition of others supply the material of sedimentary rocks; thus sandstones consist largely of quartz, shales of kaolin and other clay minerals. Those minerals (e.g. gem-stones and gold) which resist the action of weathering processes are found as water-worn pebbles and grains in detrital deposits. Other sedimentary rocks consist of minerals deposited from solution either by chemical or organic agencies, from sea-water, lakes or springs: e.g. the calcite of limestones, deposits of bog-iron-ore (limonite), gyspum, rock-salt, &c.

Minerals Segregated in Veins and Rock-cavities.—Water permeating through rock-masses takes up mineral matter in solution, and the solutions so formed may further react on the minerals composing the rocks. Such solutions will deposit some of their dissolved material in rock-cavities with the production of various minerals. For instance, the amygdaloidal cavities of basic volcanic rocks (e.g. basalt, melaphyre), especially when the rocks are somewhat weathered, are frequently partly or completely filled with agate or beautifully crystallized zeolites, calcite, &c. The crevices and joint-planes of limestone become in this way coated with crystals of calcite, and those of siliceous rocks with quartz, giving rise to the abundantly occurring quartz-veins. In sedimentary rocks, pyrites, flint and other minerals become segregated round a nucleus of organic matter. The beautiful crystal-lined crevices in the crystalline rocks of the Alps have much the same origin, and so have the various types of ore-deposits, including metallic veins or lodes. In the latter cases, however, the solutions are no doubt sometimes of deep-seated origin and often connected with igneous and metamorphic processes. Metalliferous veins are storehouses of crystallized minerals of almost every kind, some being the ores themselves and others, such as quartz, calcite, barytes, fluor-spar, being gangue minerals. By the weathering of the metallic minerals of mineral-veins numerous other finely crystallized minerals result: for example, in the upper oxidized portion of veins containing-silica-gneissic andalus, sericite and pyromorphite are often met with; in veins of copper-ore the alteration of chalcopyrite gives rise to malachite, chrysollite and cuprite.

Alteration of Minerals: Pseudomorphs.—Crystals which have been formed under one set of conditions of temperature and pressure and in the presence of certain solutions, will in many
MINERALOGY

cases may be unstable under another set of conditions. The crystals may then be corroded or even completely redissolved, or the substance may undergo a chemical or physical change and give rise to the formation of other minerals which are stable under the new conditions. The results of such changes and alterations of minerals are very frequently to be observed in nature, and several instances have already been cited in the preceding section. A good example of the secondary products which may result by the decomposition of a mineral is afforded by pyrites (FeS₂), of which two types of alteration may be distinguished. By oxidation in the presence of pure water it gives rise to ferrous sulphate (melanterite), free sulphur and sulphuric acid; the melanterite by further alteration gives various basic ferric sulphates (copiapite, &c.); and the sulphuric acid by acting on surrounding rocks (limestone, clay, &c.) gives rise to the formation of gypsum, alunimine and other sulphates. By the action of water containing oxygen and calcium carbonate in solution, pyrites suffers another kind of alteration: the sulphur is carried away in solution as gypsum and the iron is left behind as a ferric hydroxide (limonite) which preserves the original form of the crystals. We have then a pseudomorph (from ἑμος, false and μορφη, form) of limonite after pyrites; i.e., limonite with the external form of a crystal of pyrites.

Pseudomorphs are frequently met with in nature, and they are of considerable importance in studying the changes which minerals undergo. Several kinds of pseudomorphs are to be distinguished. When the alteration has involved no change in chemical composition of the material, but only in the internal crystalline structure and physical properties, the altered crystal is called a "paramorph." For example, crystals of aragonite are often altered to a confused granular aggregate of crystalline individuals of calcite, the change being accompanied by an increase in specific gravity but without change in external form: such a change may be effected artificially by simply heating a crystal of aragonite. Other examples of paramorphs are rutile with the form of anatase, and hornblende with the form of augite. An "epimorph" results from the encrustation of one mineral on another; the first may be afterwards partly or wholly dissolved out, leaving the second as a hollow shell (e.g., chalcybite after fluor-spar). As instances of pseudomorphs in which there has been some chemical change the following may be cited: by the gain of chemical constituents, e.g., malachite after cuprite; by the loss of material, e.g., native copper after cuprite; or by an interchange of constituents, e.g., galena after pyromorphite and limonite after pyrites. In other cases the changes may be due to chemical relations between the two minerals, as, for example, in pseudomorphs of native copper after aragonite or quartz after calcite. Different minerals may also take the form of various organic remains.

III.—Nomenclature and Classification of Minerals.

A mineral species, or simple mineral, is completely defined by the statement of its chemical composition and crystalline form. When we are dealing with a definite chemical compound the limitation of species is easy enough; thus corundum, cassiterite, galena, blende, &c. are quite sharply defined mineral species. But with isomorphous mixtures the division into species, or into sub-species and varieties, must be to a certain extent arbitrary, there being no sharp lines of demarcation in many isomorphous groups of minerals. Thus in the mineral tourmaline the chemical composition varies indefinitely between wide limits, but no corresponding difference can be traced in the crystalline form or in the external characters save colour and specific gravity. Some authors have therefore questioned the advisability of separating minerals into species each with distinctive names, and certain modifications have been devised to devise chemical names for the different kinds of minerals. Owing, however, to the frequency of polymorphism and isomorphism amongst mineral substances such a system presents many practical difficulties. Thus the three modifications of titanium dioxide are more simply and conveniently referred to as rutile, anatase and brookite, while to give a purely chemical designation to such a mineral as tourmaline would be quite impracticable. Further, later investigations often show that such chemical names require revision, and hence confusion may arise.

The practice of giving distinct names to different kinds of minerals dates from very early times (e.g., diamond). The common termination ite (originally itis or itis) was adopted by the Greeks and Romans for the names of stones, the names themselves indicating some character, constituent, or use of the stone, or the locality at which it was found. For example, haematite, because of the blood-red colour; siderite, containing iron; alabaster (originally alabastris), a stone from which a vessel called an alabastron was cut; magnesite, from the locality Magnesia. The custom of naming minerals after persons is of modern origin; e.g., prehnite, biotite, haüyne, zoisite. Unfortunately there is a lack in uniformity in the terminology of mineral names, many long-established names being without the termination ite, e.g., beryl, blende, felspar, garnet, gypsum, quartz, zircon, &c. The termination ite also is often used, e.g., nepheline, olivine, serpentine, tourmaline, &c.; and many others were introduced by R. J. Haüy without much reason, e.g., anatase, diopside, epidote, analcime, sphenite, &c.; (see A. H. Chester, A Dictionary of the Names of Minerals, New York, 1866).

The number of known mineral species differs, of course, according to different authors; roughly there may be said to be about a thousand. The total number of mineral names (apart from chemical names), many of them being applied to trivial varieties or given in error, amount to about 5000.

Minerals may be classified in different ways to suit different purposes; thus they may be classified according to their uses, modes of occurrence, system of crystallization, &c. The earlier systematic classifications, being based solely on the external characters of minerals, were on natural history principles and too artificial to be of any value. J. J. Berzelius, in 1815, was the first to propose a purely chemical system of classification: his primary divisions depended on the basic (electro-positive) element and the sub-divisions on the acid (electro-negative) element. Such a method of classification, though still in use for metallic ores, must be quite arbitrary or give rise to much duplication; since, apart from isomorphous replacement, many minerals contain more than one metal. The systematic classifications in use at the present day are modifications in detail of the crystallo-chemical system published by G. Rose in 1852. Here there are four main divisions, viz., elements; sulphides; arsenides, &c.; halogen compounds; and oxygen compounds: the last, and largest, division is subdivided into oxides and according to the acid (carbonates, silicates, sulphates and chromates, phosphates and arsenates, &c.); in each section isomorphous minerals are grouped together. The classifications adopted by different authors differ much in detail, especially in the large section of the silicates, which presents many difficulties and for which no satisfactory classification has yet been devised.

As an example of a systematic classification of minerals the following may be given. Except in a few details it is the classification of Dana's System of Mineralogy (6th ed., 1862). Only those minerals which are described under their respective headings in these volumes are included: the list therefore serves, at the same time, as an enumeration of the more common and important species and varieties of minerals, and as a system of classification it is necessarily incomplete. Species belonging to the same isomorphous group are bracketed together: varieties are given in parentheses after the species to which they belong. The chemical composition of each species is given by the formula; and the crystal system by the initial letters C (cubic), T (tetragonal), O (orthorhombic), M (monoclinic), A (anortic), H (hexagonal) and R (rhombohedral): when the crystal class is definitely known to be some other than the holosymmetric this is indicated by a number corresponding to those used in the article Crystallography, e.g., C2 for the tetragonal class of the cubic system.
### MINERALOGY

#### I. NATIVE ELEMENTS.

1. **Non-Metals.**
   - Diamond: C
   - Graphite: C
   - Sulphur: S

2. **Semi-Metals.**
   - Arsenic: As
   - Antimony: Sb
   - Bismuth: Bi

3. **Metals.**
   - Gold: Au
   - Silver: Ag
   - Copper: Cu
   - Platinum: Pt

#### II. SULPHIDES, ARSENIDES, TELLURIDES, ETC.

1. **Of the Semi-Metals.**
   - Reniglu: AsS
   - Sphalerite: ZnS
   - Tetradymite: BiT4S
   - Molybdenite: MoS2

2. **Of the Metals.**
   - Monosulphides, etc.
     - Argentiferous: AgS
     - Galena: PbS
     - Copper-glanze: CuS

MINERAL WATERS. No absolute line of demarcation can be drawn between ordinary and mineral waters. There is usually in the latter an excess of mineral constituents or of temperature, but some drinking waters contain more mineral constituents than others that are called mineral waters, and many very pure waters, both cold and warm, have been regarded for ages as mineral springs.

As to the origin of mineral waters, there is much in what the elder Pliny said, that waters are such as the soil through which they flow. Thus in limestone and chalk districts an excess of lime is usually present; and the waters of a particular district have much resemblance to each other—as in the Eifel, in Auvergne, and in the Pyrenees. But this is only a partial explanation, for waters are by no means necessarily uniform throughout a particular geological formation. We do not know with any certainty the depth from which various mineral waters proceed, nor the various distances from the surface at which they take up their different mineral constituents.

The source of the temperature of thermal waters remains a subject of much uncertainty. Among the assigned causes are the internal heat of the globe, or the development of heat by chemical or electrical agencies in the strata through which they arise.

Their occasional intermittence is doubtless often dependent on the periodical generation of steam, as in the case of the Geysers. A few geological facts are certain, which bear on the origin of mineral waters. Such springs are most abundant in volcanic districts, where many salts of soda and much carbonic acid are present. They occur most frequently at meetings of stratified with unstratified rocks, in saddles, and at points where there has been dislocation of strata.

The diffusion of mineral waters is very extended. Pliny was quite correct in observing that they are to be found on alpine heights and arising from the bottom of the ocean. They are found at the snow in the Himalayas and they rise from the sea at Baiae and Ischia. They are to be found in all quarters of the globe, but more particularly in volcanic regions, as in the Eifel and Auvergne, in the Bay of Naples, and parts of Greece, in Iceland, New Zealand and Japan. But there are few countries in which they are not to be found, except in very flat ones, and in deltas of rivers—for instance, in the north of France, where they are very few, and in Holland, from which they are absent.

France, Germany, Italy and Spain, as well as Greece, Asia Minor, and the Caucasus, are all rich in mineral waters. The British Isles have a fair though not very large proportion of them. There are a few in Sweden and Norway. They are abundant in the United States, less so in Canada. They are found in the Azores and in the West India Islands. Of their occurrence in the interior of Africa or of Australia we know little; and the same is true of South America. But they are met with in Algeria, in Egypt, and in the Holy Land. The vast Indian peninsula has for its size a comparatively small supply.

Mineral waters, when analysed, are found to contain a great many substances, although some of them occur only in very minute quantities: soda, magnesia, calcium, potash, alumina, iron, boron, iodine, bromine, arsenic, lithium, caesium, rubidium, fluorine, barium, copper, zinc, manganese, strontium, silica, phosphorus, besides extractive matters, and various organic deposits known under the name of glair or baren. Of gases, there have been found carbonic acid, hydrosulphuric acid, nitrogen, hydrogen, oxygen and ammonia. Of all these by far the most important in a therapeutic point of view are sodium, magnesia and iron, carbonic acid, sulphur, and perhaps hydro-sulphuric acid. These substances, detected separately by chemists, are in their analyses combined by them into various salts, if not with absolute certainty, undoubtedly with a close approximation to it. Those combinations are very numerous, and some waters contain ten to twenty of them; but there are always some predominating ones which mark their character, while many of them, such as caesium, rubidium, or fluorine, occur in smaller quantities. It is supposed that the complete solution is to be found in very much weaker or stronger solutions of salts and gases in water of higher or lower temperature. For medical purposes they are used either externally or internally. As the quantity of salts present commonly bears a very small proportion to that of the fluid containing them, water becomes a very influential agent in mineral-water treatment, about which it is therefore necessary to say something.

For the action of mineral-water baths see BALNEOTHERAPEUTICS. According to the most generally received opinion, the cutaneous surface does not absorb any portion of the salts in a mineral-water bath, although it may absorb a little gas (and alkaline water, for instance, at most acting as a slight detergent on the skin), and that neither salts nor gases have any action on the system, except as stimulants of the skin, with partial action on the respiratory organs.

It seems to be ascertained that drinking considerable amounts of cold water reduces the temperature of the body, diminishes the frequency of the pulse, and increases the blood pressure. Water is a very powerful diuretic; and when introduced into the stomach, usually if it is empty, is quickly absorbed; but, although much of the water passes into the veins, there is no proof that it ever produces in them, as is sometimes supposed, a state of fluidity or wateriness. Therapeutically, the imbibition of large quantities of water leads to a sort of general washing out of the organs. This produces a temporary increase of certain excretions, augmented diuresis, and a quantitative increase of urea, of chloride of sodium, and of phosphoric and sulphuric acids in the urine. Both the sensible and the insensible perspirations are augmented. A draught of cold water undoubtedly stimulates the peristaltic action of the intestines. On the whole water slightly warm is best borne by the stomach, and is more easily absorbed by it than cold water; and warm waters are more useful than cold ones when there is much gastric irritability. In addition to the therapeutic action of mineral waters, there are certain very important subsidiary considerations which must not be overlooked. An individual who goes from home to drink them finds himself in a different climate, with possibly a considerable change of food. When introduced into the stomach, it is, from the usual home drinks given up. There is change in the hours of going to bed and of rising. He is relieved from the routine of usual duties, and thrown into new and probably cheerful society. He takes more exercise than when at home, and is more in the open air, and this probably at the best season of the year. So important has this matter of season and climate been found that it is an established axiom that waters can be used to the greatest advantage during the summer months and in fine weather, and during the periods most convenient for relaxation from business. Summer is therefore the bath season, but of late years provision has been made in many places, with the aid of specially constructed rooms and passages, for carrying out cures satisfactorily during the winter season, e.g. at Aix-la-Chapelle, Wiesbaden, Baden Baden, Baden in Switzerland, Dax, Vichy and Bath. The ordinary bath season extends from the 15th of May to the 20th or 30th of September. The season for baths situated at considerable elevations commences a month later and terminates some ten days earlier. Mineral waters may be employed at home, but patients seldom use them; and this necessarily limits the time of their use. It is commonly to declare that the treatment should last for such or such a period. But the length of time for which any remedy is to be used must depend on its effect, and on the nature of the particular case. It is found, however, that the continued use of mineral waters leads to certain disturbances of the system, which have been called crises, such as sleeplessness, colic and diarrhoea, and to skin eruptions known as la pousse. This cause, and also certain peculiarities of the female constitution, have led to the period of three weeks to a month being considered the usual period for treatment. A certain after-treatment is often prescribed—such as persistence.
in a particular diet, visiting springs or climates of a different and usually of a tonic character, or continuing for a certain time to drink the waters at home. It may be added that the advantage of having recourse to mineral waters is often felt more than after during treatment.

Since improved methods of bottling have been discovered, and the advantage of an additional supply of carbonic acid has been appreciated, the export of waters from their sources has increased enormously, and most of the principal waters can now be advantageously used at home. It may be added that many of the artificial imitations of them are excellent.

The history of the use of mineral waters can only just be

WATERS

a good deal of nitrogen in some of them; the quantity of hydro-
sulphuric acid, even in strong sulphuric waters, is wonderfully
small; but the volume of carbonic acid present is often very
large—for instance, in the case of Kissingen, Schwalbach
and Selters. The immediate effect of the carbonic acid which they
contain is that of pleasant stimulation to the stomach and system.
Extremely little appears to be known of its actual operation on
the system: a part of what is swallowed is returned by eructation,
and a part passes on to the intestines; whether any appreciable
quantity reaches the blood is doubtful. There is no question
that carbonic acid increases diuresis. Practically it is found
to aid digestion, helping the functions of the stomach, and in

alluded to. They have been employed from the earliest periods,
and traces of Roman work have been found at most of
the European baths which are now in favour—almost all the
thermal ones. Occasionally new springs are discovered in old
countries, but the great majority of them have been long known.
Warm waters, and those containing small quantities of mineral
constituents, appear to have remained more steadily in favour
than any other class within the appropriate sphere of mineral
waters, which is limited to the treatment of chronic disease.

The attempt has been made to range mineral waters according
to their therapeutic action, according to their internal or external
use, but most generally according to their chemical constituents
so far as they have been from time to time understood; and a
judicious classification undoubtedly is a help towards their
rational employment. But their constituents are so varied, and
the gradations between different waters are so finely shaded off,
that it has been found impossible to propose any one definite
scientific classification that is not open to numberless objections.
Thus a great many of the sulphur waters are practically earthy
or saline ones. Yet because they contain very minute amounts
of such a gas as hydro-sulphuric acid, an ingredient so palpable
as always to attract attention, it is considered necessary to class
them under the head of sulphur. The general rule is to attempt
to class a water under the head of its predominant element; but
if the amount of that by extremely small, this leads to such
waters as those of Mont Dore being classified as alkaline or
arsenical, because they contain a very little soda and arsenic.
The classification in the following table, which is that usually
adopted in Germany, has the merit of comparative simplicity,
and of freedom from theoretical considerations which in this
matter influence the French much more than the German writers.
The more important constituents only are given. The amount
of solid constituents is the number of parts to one thousand parts
of the water; the temperature of thermal springs is added. The
waters are classified as indifferent, earthy, salt, sulphuretted, iron,
alkaline, alkaline-saline—with sub-varieties of table waters and
purging waters.

In addition to their solid constituents, gas is present in many
waters in considerable quantity. There is a little oxygen and

its tendency to accumulate on account of its heavy specific
gravity. Carbonic acid gas, used as a bath, proves stimulating
to the skin and to the general system; but its employment has
not answered the expectations formed of it.

Indifferent Waters scarcely vary in chemical qualities from
ordinary drinking water; but they are usually of higher temperature.
Their therapeutic action, which is mainly exercised through baths,
has been explained on the theory of peculiarities of their electric or
thermal condition, about which we know nothing definite, and on
the presence in some of them of a large quantity of nitrogen. It
has also been ascribed to the various organic substances in some of
them, such as glair, which, when collected, is very useful
as a cataplasm. These waters are not often much drunk, but any

neuralgic aided the been been by the amount of of the way of the Russian and biliary calculi and it may be explained the chronic scaly eruptions. There was formerly a tendency to consider these waters useful in urinary affections; but at the present day it is only the colder ones that have come into repute for the expulsion of gravel and uric acid calculi, and the treat-
ment of affections of the bladder generally. Some of them have also of late years been considered to exercise a favourable influence
on scrofula, and to be useful in the early stages of pulmonary phthisis.
This has been attributed to the presence of irone especially in them, although it is known that most of its salts pass through the system unaltered. Many of these baths, such as Leuk and Bormio, enjoy the advantages of great elevation, but Bath, otherwise one of the best of them, lies low.

| B. de Bigorre, Pyr-

enes             |              |              |                   |

Salt Waters are so called from containing a predominant amount of chlorides of sodium. They also generally contain chlorides of magnesium and of lime, and occasionally small amounts of lithium, bromine and iodine. They further often contain a little iron, which is an important addition. The great majority of the salt waters have a large supply of carbonic acid. There are cold and hot salt springs. Sometimes they are used for drinking, sometimes for bathing; and the double use of them is often resorted to.
This water, when softened by boiling, is usually set down at about 300 grains. The maximum quantity likely to be taken at any well may be 225 grains, but commonly not more than half of that amount is taken. The increase to the usual daily amount is therefore not much more than one-third. Still it may be assumed that the action of a solution of salt on an empty stomach is different from that of the same amount of salt taken with food. Salt introduced into the stomach excites the secretion of gastric juice and favours the peristaltic actions, and when taken in considerable quantity is distinctly aperient. We thus see how it is useful in dyspepsia, in atony of the stomach and intestines, and sometimes in chronic intestinal catarrh. Salt when absorbed by the stomach appears again in the urine, of which it increases the amount both of fluid and of solid constituents, especi-
ally of the urea. It seems, therefore, to be pretty certain that considerable quantities of salt taken into the circulation increase the excretion of nitrogenous products through the urine, and on the whole accelerate the transformation of tissue. Salt is thus useful in scrofula by stimulating the system, and also in anemia, especially when iron is also present. In some German stations, as at Soden, carbonated salt waters are considered to be useful in chronic laryngitis or granular pharyngitis.

Bath, as a salt water, as usually given, rarely contains more than
5% of chloride of sodium, the most of the strongest perhaps from 8 to 10%. Their primary action is as a stimulant to the skin, in
which action it is probable that the other chlorides, especially that of calcium, and still more the carbonic acid often present, co-operate.

In this way, and when aided by various processes of what may be termed water poultries and packing, they are often useful in remov-
ing exudations, in chronic metritis and in some tumours of the uterus, and generally in scrofula and rachitis, and occasionally in some chronic skin affections.

The French accord high praise to some of their thermal salt waters
in paralysis, and some German ones are used in a similar way in affections. The salt waters are sometimes so strong that they must be diluted for bathing. In other cases concent-
trated solutions of salt are added to make them sufficiently strong.
These waters are widely diffused, but on the whole Germany is richest in them, especially in such as are highly charged with salt. The potassium springs may be considered of the chemical of the bathing
wells, and sea-water of bathing waters. The air of salt-works and pulverization of the water are employed in German baths as remedial
agents.

Salt springs are found in many quarters of the world, but the chief carbonated groups for drinking purposes occur in Germany, and at Saratoga in America, where very remarkable wells indeed are to be found. France and England have no springs of this class. The stronger wells, used chiefly for bathing, occur where

Almost all the above stations have several springs of various strengths; the cold may be said to vary from 14 to 5-8% of chloride of sodium, the warm are generally weaker, perhaps varying from 5-8 to 1-6;

there are salt-bearing strata, as in Germany, Italy, Switzerland,
France and England. Very powerful waters of this class are those of St Catherines in Canada.
The presence of minute portions of iodine or bromine in salt waters is by no means infrequent, and they appear in considerable quantity in some few. It is, however, extremely doubtful whether any known spring contains a sufficient quantity of iodine, still more of bromine, to act specially on the system, even if that action were not necessarily superseded by the presence of the large quantity of

MINERAL WATERS 519
MINERAL WATERS

other salts with which they are associated. Some of the best-known springs of the kind are: Chelles, Wildeg, Castrocaro, Hall, Adelheim's Quelle, Krankenheil, Kreuznach, Woodhall Spa.

Iron or Chalybeate Waters.—Iron usually exists in waters in the state of protoxide or its carbonate, less frequently as sulphate or cyanate, and very rarely, if at all, as chloride. The quantity present is usually extremely small. It may be said to vary from 0.12 to 0.03 in the 1000 parts of water. Some wells considered distinct chalybeates contain less than 0.03. Many wells, especially in Germany, have a rich supply of carbonic acid, which is unfortunately wanting in French and English ones.

It has long been the prevalent idea that iron in the blood is the main cause of chlorosis and of other anaemic conditions, and that these conditions are best relieved by a supply of that metal. Since the detection of it in haemoglobin this view has been still more popular. It is pretty certain that the blood contains 37 to 47 grains and the whole system 70 to 74 grains of iron; and it has been calculated that the amount of iron taken in daily in articles of food, and that the same amount is passed in the faeces; for although the stomach takes the iron up it is excreted by the alimentary canal mainly, it being doubtful whether any is excreted in the urine. It

any other explanation be satisfactory, there is no question as to the excellent effects often produced by drinking chalybeate waters (especially when they are carbonated), and by bathing in those which are rich in carbonic acid after they have been artificially heated. As regards the drinking cure we must not, however, forget that carbonate and chloride of sodium, and also the sulphate, are often present and must be ascribed a share in the cure. Thus chloride of sodium is a powerful adjuvant in the strong Stahl Quelle of Homburg and in the Putnam Well at Saratoga. A whole catalogue of scales of these waters is treated successfully with these waters. Indeed, anaemia from any source, as after fever or through loss of blood, and enlargements of the spleen, are benefited by the stimulating action of the copious supply of carbonic acid in many cases. To this end, they are used as a bath and the system is treated in direct absorption of iron from the bath. Iron waters are scarcely ever thermal. They are extremely common in all countries—frequently along with sulphured hydrogen in bogs and near springs. But such springs and non-carbonated waters generally are weak, and not more than seven or eight of them are of importance. It may be added that some of the strongest known iron waters are sulphated or aluminaed. They are stypic and astringent, and can only be used diluted. They are sometimes useful as an application to ulcers and sores. Such springs have often been brought into notice, but never retain their popularity. They are known in the Isle of Wight, in Wales, in Scotland, as well as in Elba, &c.; and of late years the Bedford Alum and Oak Orchard Springs, U.S., have been brought into notice, the latter containing a few grains of free sulphuric acid in the pint. All such springs have been considered useful in scrofula, anaemia and chronic diarrhoea.

Sulphur Springs.—Waters having the odour of hydro sulphuric acid (or slighty in the case of some of the others) are powdery, or they owe their smell sometimes to the presence of the free acid, sometimes to sulphides of sodium, calcium or magnesia, and sometimes to both. Sulphured hydrogen is absorbed more freely by cold than by hot water, and is therefore most abundant in cold springs. The sulphured hydrogen is probably dissolved in the gypsum in the localities, and springs occur near coal or shale measures, or strata containing fossils, or in places where generally matter is present in the soil or strata. Many of them contain so little mineral impregnation that they might as well be classed among the acid or earthy waters. One group contains a considerable amount of chloride of sodium, another of sulphate of lime, while a third has little mineral impregnation, but contains sulphides.

Sulphured hydrogen is a strong poison, but its action on the system has been pretty well ascertained. It has been assumed that the gas in mineral waters acts similarly, though in a modified degree; but there is next to nothing absolutely known of the action of its small quantities in the gas that are present in mineral waters, and which certainly have no toxic effect. It has been assumed that this gas has some special action on the portal system and so on the liver. On the connection of metallic poisoning with the liver has been founded the idea that sulphur waters are useful in metallic intoxication. Drinking large quantities of these waters, especially of such as contain sulphates or chlorides of sodium or magnesia, combined with hot baths and exercise, may help to break up albuminates, but there is no proof of the action of the sulphur.

For similar reasons, and primarily to counteract mercureal poison, sulphur waters have been considered useful in syphilis. But it may be well to remember that at most baths mercury is used along with them. No doubt they are frequently, like all other waters, useful in bringing out old eruptions, acting in this way as a test for syphilitic poison, and in indicating the treatment that may be

is possible by drinking several glasses to take in more than a grain of carbonate of iron in the day, equivalent to half that amount of metallic iron. It has further been ingeniously reckoned from practice that 10 to 15 grains of metallic iron suffice to supply the deficiency in the system in a case of chlorosis. It is thought probable that a portion of the iron taken up in water is in certain pathological states not excreted, but retained in the system, and goes towards making up the want of that metal. But whether this or

required. Sulphur waters, both hot and cold, are used in gout and rheumatism, in dyspepsia, in hepatic and cutaneous affections; and of late years inhalation of the gas has been popular in phthisis and in laryngeal affections. They have long been the recognised remedies in cutaneous affections. While so much doubt has been cast on the action of the sulphur of these waters, it may be admitted that the sulphides are probably decomposed in the stomach and sulphured hydrogen generated. That gas is probably a slight stimulant

to the intestine. What sulphuretted hydrogen reaches the blood is eliminated by the lungs. There seems to be no doubt that the gas is absorbed in small quantities by the skin.

It is in sulphur waters chiefly that glairin and barenfig occur. This peculiar organic substance has been found both in American and in European springs. Cold sulphur springs are very widely diffused throughout the world. Thermal ones are not so common. Perhaps the largest though not the strongest group of the latter is to be found in the Pyrenees. We may remark again how very little is specially said about the German and French, they are much better known in Italy and elsewhere: Heppingen, Roisdorf, Landskro, Apollinaris, Selters, Brückelau, Gieshübel all German; St Galmier, Pougues, Chatelton, French.

Associated with Class III is that of the strongly sulphated waters known in Germany as bitter or purging waters, which have of late deservedly come into use as purgative agents. They are perhaps best known and in America, and there are no very good ones in England. The chief supply is from Bohemia and Hungary.

**Hydrosulphuric Acid**

Hydrosulphuric acid is one of the most favourable springs, including the very popular White Sulphur ones of Virginia. There seems to be something peculiarly unsatisfactory in the analysis of sulphur waters, and there has been difficulty in constructing the following imperfect table.

Some of the most powerful cold wells are those of Challes (with its very peculiar water), Leuk and Harrogate. Uriage has a very large amount of chloride of sodium in its springs. Cold sulphur waters are on the whole the most used in liver and indigestion than warm ones. The general effects of warm sulphur waters differ so little at the various baths as to make it difficult to mention anything special to particular localities. Schinznach has a reputation in skin complaints, Cauteret, Eaux Bonnes and Challes in laryngeal affections, and two Aix, Luchon and Archena in syphilis.

**Alkaline Waters**

Alkaline Waters are such as contain carbonate (chiefly bicarbonate) of soda, along with an excess of carbamic acid. Of the action of those carbates it is known that when taken into the stomach they are neutralized by the gastric juice, and converted into carbonate of sodium. On their introduction into the stomach they produce an increased flow of gastric juice. If given during or immediately after meals in any quantity, they impede digestion. They slight inflammation of the gastric action, but only feebly, unless assisted by other salts. They act slightly as diuretics. Of the connexion between the biliary system and alkalies, which undoubtedly exists, not much is known with certainty. The alkalization of the blood by them is assumed but not proved. It is very doubtful whether they reduce the quantity of fibrin in the blood, and thus induce a lowered state of the system, or whether they have any direct tendency to combine with fat and carry off a portion of superfluous adipose tissue. Their excess of carbamic acid on the other hand favours the formation of alkaline waters. They have been classified as follows: (1) simple alkalines, where carbonate of soda is the main agent; (2) waters containing in addition some chloride of sodium; (3) waters containing sulphates of soda of magnesium. All these classes are said to be used in gout, lithiasis, affections of the liver, catarrh and obstructions of the gall ducts, in dyspepsia, chronic catarrh of the stomach and diarrhoea, in obesity and in diabetes.

The waters of the second class are used to modifying the secretory actions of both the heart and the kidneys, while the more powerful sulphated waters of the third class are especially useful in catarrh of the stomach, and in affections of the biliary organs; of these only one of importance (Carlsbad) is thermal.

The action of the carbonate of soda is as much on the surface of the stomach. The cold ones are chiefly used internally, the thermal ones both internally and externally. The latter, besides acting as warm water, slightly stimulate the skin when the carbonic acid is abundant, and the carbonate of soda has such a slight deterrent effect on the cutaneous surface like soap. These waters are unknown in England. They are most abundant in countries of extinct volcanoes.

Their practical importance in aiding digestion is in reality much greater than one could expect from their scanty mineralization. They are drunk by the country people, and also largely exported and imitated. They are very abundant on the Continent, and, although some of the best-known ones enumerated below are: German and French, they are much better known in Italy and elsewhere: Heppingen, Roisdorf, Landskro, Apollinaris, Selters, Brückelau, Gieshübel all German; St Galmier, Pougues, Chatelton, French.
**MINERVA**

Bourboule, Mont Doré, Royat, Salies (Bigorres), Plombières, Baden-Baden.

Of late years **lithium** has been discovered in the waters of Baden-Baden; and various other places boast of the amount of that substance in their springs. Indeed a new bath has been established at Assmannshausen on the Rhine in consequence of the discovery of a weak alkaline spring containing some lithium. Not very much is known of the action of lithium in ordinary medicine, and it undoubtedly does not exist in medicinal doses even in the strongest springs. Among these springs are those of Baden-Baden, Assmannshausen, Elster, Royat, Balston Spa, and Saratoga (U.S.).

**AMERICAN MINERAL WATERS.—**The number of springs in the United States and Canada to which public attention has been called on account of their supposed therapeutic virtues is very large, amounting in all to more than three hundred. Of this number comparatively few are in Canada, and of these not more than five at St Catharines, Caledonia, Plantagenet, Caxton, Charlotteville and Sandusky. The latter three belong to the saline class. The Caxton is alkaline-saline, and the last two are sulphur waters. The St Catharines and Sandusky springs likewise surpass the noted sulphur-waters of Europe in their excessive percentages of sulphurated hydrogen, the former containing more than 5 and the latter 4.72 cub. in. of the latter gas.

The mineral springs in the United States are very unequally distributed, by far the largest number of which are in high medical repute occurring along the Appalachian chain of mountains, and more especially along the_line of_ the lime and the alkaline spring routes. By the series of upheavals which gave rise to the many parallel mountain ridges of the Appalachians. In many places the springs occur directly along the lines of fault. The various classes of mineral springs are those which rise from the lime and the alkaline springs, and those containing Glauber and Epson salts, being much inferior to their European representatives. On the other hand, the very numerous and abundant springs of Saratoga compare very favourably with the Saratoga and among the many American chalybeate springs the subclass represented by the Rockbridge Alum is unequaled in regard to the very large percentages of alumina and sulphuric acid which it contains.

Besides its other admirals it is a panacea for Gout; also for the Ballston spring surpasses the similar saline waters of Homburg, Kissingen, Wiesbaden and Selters, in its percentage of carbonate of lime (53 cub. in.). It is also remarkable for the very large proportion of carbonate of lime, amounting to 0-710 grains.

Thermal springs are especially numerous in the territories west of the Mississippi and in California. Those in the east most occur in Virginia along the southern portion of the Appalachian chain; in the middle and New England States Lebanon is the only important thermal spring. Subsequent to the discovery of springs, the design being to represent as many of the more noted spas as possible, while at the same time enumerating the best representatives of the classes and subclasses into which mineral waters are divided, according to the following table:

MINGRELI, a former principality of Transcaucasia, which belonged to Russia in 1824, and since 1867 has belonged to the government of Kutais. The country corresponds to the ancient Colchis; and Sukhnum Kaleh on the Black Sea coast, which was the capital under the Dadian dynasty (1325-1604), is to be identified with the ancient Dioscurias, a colony of Miletus. The Mingrelians, who are closely akin to the Georgians, numbered 241,000 in 1902, and belong to the Orthodox Greek Church (see further KUTAIS and CAUCASIA).

MINIATURE. The word “miniature,” derived from the Latin minimum, red lead, has been technically employed, in the first instance, to describe a picture in an ancient or medieval manuscript; the simple decoration of the early codices having been “miniated” or delineated with that pigment. The generally small scale of the medieval pictures has led secondly to a pseudo-etymological confusion of the term with “minute-ness” and to its application to “paintings in little”; it is now used mainly in this sense, and is ordinarily applied to a painting or drawing on a very small scale, usually a portrait, and by analogy to anything on a very small scale.

1. Miniatures in Ancient and Medieval MSS.—The part played by the miniature in the scheme of the ornamentation of MSS., in the early centuries of the Christian era and in the middle ages, is dealt with in the article on ILLUMINATED MSS. In the present article will be discussed the development and changes which it underwent, in different ages and in different countries, both in its technical treatment and in its leading characteristics. The subject divides itself into two distinct portions, the classical and the medieval, between which there lies the great separating space of the early middle ages, which affords but scanty material to connect them. When, however, we have advanced into the middle ages, we are no longer at a loss; and we can follow the later development of the miniature through all its changes in the various schools of western Europe down to its transition into the modern picture.

The miniature has perhaps hardly received in the past the recognition which it merits. The history of painting cannot be perfectly understood without a knowledge of the rise and progress of the art of miniature-painting in MSS.; and examples of the art still survive in an abundance which frescoes and paintings in the large cannot rival. Modern methods of photography have brought within the reach of the student material which in earlier generations was not accessible; and consequently a juster conception can be formed of the position which the miniature holds in the history of art than was possible before.

The earliest examples that have descended to us are closely connected in style and treatment with the pictorial art of the later Roman classical period. In fact they are separated from that period by only two or three centuries, and they still follow its traditions. The oldest specimens of all are the series of coloured drawings or miniatures cut from an illustrated MS.
of the Iliad and now in the Ambrosian Library at Milan, which is good reason for placing as early as the 3rd century. In this period there is a considerable variety in the quality of the drawing, but there are many notable instances of fine figure-drawing, quite classical in sentiment, showing that the earlier art still exercised its influence. Such indications, too, of landscape as are to be found are of the classical type, not conventional in the sense of medieval conventionalism, but still attempting to follow nature, even if in an imperfect fashion; just as in the Pompeian and other frescoes of the Roman age.

Of even greater value from an artistic point of view are the miniatures of the MS. of Virgil, known as the “Schedae Vaticanae,” of the 4th century. They are in a more perfect condition and on a larger scale than the Ambrosian fragments, and they therefore offer better opportunity for examining method and technique. The drawing is quite classical in style, and the idea is conveyed that the miniatures are direct copies from an older series. The colours are opaque: indeed, in all the miniatures of early MSS. the employment of body colour was universal. The method followed in placing the different scenes on the page is highly instructive of the practice followed, as we may presume, by the artists of the early centuries. It seems that the background of the scene was first painted in full, covering the whole surface of the page; then, over this background were painted the larger figures and objects; and over these again the smaller details in front of them were superimposed. Again, for the purpose of securing something like perspective, an arrangement of horizontal zones was adopted, the upper ones containing figures on a smaller scale than those below.

It was reserved for the Byzantine school to break away more decidedly from the natural presentation of things and to develop convention. Yet in the best early examples of this school the classical sentiment still lingers, as the relics of the miniatures of the Cottonian Genesis in the British Museum, and the best of the miniatures of the Vienna Dioscorides testify; and in the miniatures of the later Byzantine MSS., which were copied from earlier examples, the reproduction of the models is faithful. But on comparing the miniatures of the Byzantine school generally with their classical predecessors, one has a sense of having passed from the open air into the cloister. Under the restraint of ecclesiastical domination Byzantine art became more and more stereotyped and conventional. The tendency grows to paint the flesh-tints in swarthy hues, to elongate and emaciate the limbs, and to stiffen the gait. Browns, blue-greys and neutral tints are in favour. Here we first find the technical treatment of flesh-painting which afterwards became the special practice of Italian miniaturists, namely the laying on of the actual flesh-tints over a ground of olive, green or other dark hue. Landscape, such as it was, soon became quite conventional, setting the example for that remarkable absence of the true representation of nature which is such a striking attribute of the miniatures of the middle ages.

And yet, while the ascetic treatment of the miniatures obtained so astonishing a result, it must be observed at the same time the Oriental sense of splendour shows itself in the brilliancy of much of the colouring and in the lavish employment of gold. In the miniatures of Byzantine MSS. are first seen those backgrounds of bright gold which afterwards appear in such profusion in the productions of every western school of painting.

The influence of Byzantine art on that of medieval Italy is obvious. The early mosaics in the churches of Italy, such as those at Ravenna and Venice, also afford examples of the dominating Byzantine influence. But the early middle ages provide but few landmarks to guide the student; and it is only when he emerges into the 12th century, with its frescoes and miniatures still bearing the impress of the Byzantine tradition, that he can be satisfied that the connexion has always existed during the intervening centuries.

When we turn to the farther west of Europe, there also we find under the Carolingian monarchs a school of painting obviously derived from classical models, chiefly of the Byzantine type, but whether derived directly from the East, or, what is more probable, transmitted through Italian channels, must remain doubtful. The interest of that school for our present purpose is that it was the parent of the later miniature-painting in the countries of the West. For in the native schools of those countries decoration only was the leading motive. In the MSS. of the Merovingian period, in the school which connected Frankland and northern France, and which is known as Lombardic or Franco-Lombardic, in the MSS. of Spain, in the productions of the Celtic school of our own islands, figure-drawing was scarcely known, and where it was practised it was of a barbarous character, serving rather as a feature of decoration than as a representation of the human form. Hence in those native schools the miniature, in its true sense of a picture, may be regarded as non-existent.

From these native schools we exclude the Anglo-Saxon school, developed especially at Canterbury and Winchester, which probably derived its characteristic free-hand drawing from classical Roman models, scarcely influenced by the Byzantine element. The highest qualities of the miniatures of the roth and 11th centuries of this school lie in fine outline drawing, which had a lasting influence on the English miniature of the later centuries. But the southern Anglo-Saxon school rather stands apart from the general line of development of the western medieval miniature. How far it was affected by Continental influence will be presently noticed.

Turning to the productions of the Carolingian school, which owed its origin to the encouragement of Charlemagne, it is seen that the miniature appears in two forms. First, there is the truly conventional miniature following the Byzantine model, the subjects being generally the portraits of the Evangelists, or portraits of the emperors themselves: the figures stiff and formal; the pages brilliantly and often coarsely coloured and gilded, generally set in architectural surroundings of a fixed type, and devoid of landscape in the real sense of the word. On the other hand, there is also the miniature in which there is an attempt at illustration, as, for example, the depicting of scenes from Bible history. Here there is more freedom; and we trace the debased classical style which copies Roman, as distinguished from Byzantine, models. The figure-drawing is sufficiently clumsy, but the type is Roman, or debased Roman, and the costumes are clearly derived from the same source. Here, too, there is a better attempt at landscape, which is not of the absolutely conventional deadness of the Carolingian-Byzantine type. But this second style of illustrative miniature appears only occasionally. The other was the characteristic miniature of the Carolingian school, and, accompanied as it was with profuse decoration in border and initial, it set the pattern for the later Continental schools of the West.

The influence which the Carolingian school exercised on the miniatures of the southern Anglo-Saxon artists shows itself in the extended use of body-colour and in the more elaborate employment of gold in the decoration. Such a MS. as the Benedictional of Aethelwold, bishop of Winchester, 993 to 694, with a wealth of miniatures drawn in the native style but painted in opaque colours, exhibits the influence of the foreign art. But the actual drawing remained essentially national, marked by its own treatment of the human figure and by the peculiar disposition of the drapery with fluttering folds. Its fault was over-refinement, tending to an affected exaggeration and disproportion of the limbs. With the Norman Conquest this remarkable native school passed away.

The period immediately succeeding the Carolingian school in western Europe was one of extreme decadence in the miniatures of MSS. In the 10th and 11th centuries they were mere lifeless copies of earlier types. But with the awakening of art in the 12th century the decoration of MSS. received a powerful impulse. Although the artist of the time excels in the border and the initial, still in the miniature also there is vigorous drawing, with bold sweeping lines and careful study of the draperies. The artist now grows more practised in figure-drawing, and while there is still the tendency to repeat the same subjects in the same conventional manner, individual effort
produced in this century many miniatures of a very noble character. The Norman Conquest had brought England directly within the fold of Continental art; and now began that grouping of the French and the English and the Flemish schools, which, fostered by growing intercourse and moved by common impulses, resulted in the magnificent productions of the illuminators of north-western Europe from the latter part of the 12th century onwards. But of natural landscape there is nothing, unless rocks and trees of a stereotyped character can be so regarded. Hence the background of the miniature of the 12th and immediately succeeding centuries became the field for decoration to throw into stronger relief the figures in the scene. And thus arose the practice of filling in the entire ornament with a sheet of gold, often burnished: a brilliant method which we have already seen practised in the Byzantine MSS. We have also to notice the conventional treatment of the sacred figures, which continue henceforth, from a sense of veneration, to be clad in the traditional robes of the early centuries, while the other figures of the scene wear the ordinary dress of the period.

It will be convenient, at this point, to follow the development of the miniature in the northern schools of England and France, and the Low Countries, occasionally glancing at Germany, during the next three centuries, and to leave aside for the moment consideration of the Italian school and the schools allied therewith.

Entering the 13th century, we reach the period when the miniature may be said to justify the modern false etymology which has connected the title with minuteness. The broad, bold style of the 12th century gives place to the precise and minute. Books in general exchanged their form from the large folio to the octavo and smaller sizes. There was a greater demand for books; and vellum was limited in quantity and had to go further. The handwriting grew smaller and lost the roundness of the 12th century. Contractions and abbreviations in the texts largely increased in number, and there was an effort to save space. And so with the miniature. Figures were small, with delicate strokes in the features and with neat slim bodies and limbs. The backgrounds blaze with colour and burnished gold; and delicate diaper patterns of alternate gold and colour abound. Frequently, and especially in English MSS., the drawings are merely tinted or washed with transparent colours. In this century, too, the miniature invades the initial. Whereas in the earlier periods bold flowering scrolls are the fashion, now a little scene is introduced into the blank spaces of the letter. To compare the work of the three schools, the drawing of the English miniature, at its best, is perhaps the most graceful; the French is the neatest and the most accurate; the Flemish, including that of western Germany, is less refined and in harder and stronger lines. As to colours, the English artist affects rather lighter tints than those of the other schools: a paleness is to be observed for light green, for grey-blue, and for lake.

The French artist loved deeper shades, especially ultramarine. The Flemish and the German painted, as a rule, in less pure colours and inclined to heaviness. A noticeable feature in French MSS. is the red or copper-hued gold used in their illuminations, in strong contrast to the paler metal of England and the Low Countries.

It is remarkable how the art of the miniature throughout the 13th century maintains its high quality both in drawing and colour without any very striking change. Throughout the century the Bible and the Psalter were inavour; and naturally the same subjects and the same scenes ran through the period and were repeated by artist after artist; and the very character of those sacred books would tend to restrain innovation. But towards the close of the period such secular works as the romances were growing in popularity, and afforded a wider field for the invention of the illustrating artist. Therefore with the opening of the 14th century a palpable change of style supervenes. We pass to more flowing lines; not to the bold sweeping strokes and curves of the 12th century, but to a graceful, delicate, yielding style which produced the beautiful swaying figures of the period. In fact the miniature now begins to free itself from the role of an integral member of the decorative scheme of illumination and to develop into the picture, standing on its own artistic merit for the position it is to hold in the future. This is shown by the more prominent place that the miniature now assumes, and by its growing independence of the decorative border and initial. But, at the same time, while the miniature of the 14th century thus strives to disassociate itself from the rest of the illuminated details of the MS., within itself it flourishes in decoration. Besides the greater elasticity of the figure-drawing, there is a parallel development in the design of the backgrounds. The diapers become more elaborate and more brilliant; the beauty of the burnished gold is enhanced by the stippled patterns which are frequently worked upon it; the gothic canopies and other architectural features which it became the practice to introduce naturally followed the development of the architecture of the period. In a word, the great expansion of artistic sentiment in decoration of the best type, which is so prominent in the higher work of the 14th century, is equally conspicuous in the illuminated miniature.

In the early part of the century, English drawing is very graceful, the figures bending with a waving movement which, if they were not so simple, would be an affectation. Both in the outline specimens, washed with transparent colour, and in the fully painted examples, the best English work of this time is unsurpassed. French art still maintains its neat precision, the colours more vivid than those of England and the faces delicately indicated without much modelling. The productions of the Low Countries, still keeping to the heavier style of drawing, appear coarse beside the works of the other schools. Nor does German miniature art of this period hold a high position, being generally mechanical and of a rustic character. As time advances the French miniature almost monopolizes the field, excelling in brilliancy of colouring, but losing much of its purity of drawing although the general standard still remains high. The English school gradually regregad; and, owing no doubt to political causes and to the wars with France, appears to have produced no work of much value. It is only towards the end of the century that there is a revival.

This revival, which is referred to in the article on ILLUMINATED MSS., has been attributed, with some reason, to a connexion with the flourishing school of Prague—a school which in the scheme of colouring suggests a southern influence—following on the marriage of Richard II. with Anne of Bohemia in 1382. The new style of English miniature painting is distinguished by richness of colour, and by the careful modelling of the faces, which compares favourably with the stricter treatment by the contemporary French artists. Similar attention to the features also marks the northern Flemish or Dutch school at this period and in the early 15th century; and it may therefore be regarded as an attribute of Germanic art as distinguished from the French style. The promise of the new development in English miniature painting, however, was not fulfilled. In the first quarter of the 15th century, examples of great merit were produced, but at a standstill in drawing and fettered by medieval convention. The native art practically came to a close about the middle of the century, just when the better appreciation of nature was breaking down the old conventional representation of landscape in European art, and was transforming the miniature into the modern picture. Whatever miniature painting was to be produced in England after that time was to be the work of foreign artists or of artists imitating a foreign style. The condition of the country during the Wars of the Roses sufficiently accounts for the abandonment of art. Thus the history of the miniature in the 15th century must be sought in the manuscripts of the Continental schools.

First we have to consider northern France and the Low Countries. As it passes out of the 14th and enters the 15th century, the miniature of both schools begins to exhibit greater freedom in composition; and there is a further tendency to aim rather at general effect by the colouring than neatness in drawing. This was encouraged by the wider field opened to
the miniaturist. Books of all kinds were illustrated, and sacred books, Bibles and Psalters and liturgical books, were no longer the chief, if not the only, MSS. which were illuminated. And yet there was one class of MSS. which came into the greatest prominence and which was at the same time liturgical. This was the Horae, or Hours of the Virgin, &c., devotional books for individual use, which were multiplied in vast numbers and contained some of the finest work of the miniaturists. The decoration of these little volumes escaped in great measure from the conventional restraints which their religious character might have imposed. Futhermore, the demand for illuminated MSS. had by this time established a regular trade; and their production was not confined, as formerly, to the cloister with its narrow and limited views.

Early in the century the old conventional treatment of landscape still held its own; nor did the diapered and gilded background pass out of use. Indeed, in some of the finest French specimens of the time the diapered patterns are more brilliant than ever. But natural scenery in the second quarter of the century asserts itself more decidedly, although with faults in perspective. It was not until another generation had arisen that there was a true appreciation of the horizon and of atmospheric effect.

The miniatures of the French and Flemish schools ran fairly parallel for a time, but after the middle of the century national characteristics become more marked and divergent. The French miniature began to deteriorate, though some very fine examples were produced by the more gifted artists of the school. The figure-drawing was more careless, and the painting tended to hardness without depth, which the artist endeavoured to relieve by an excess of gilt shading. The close of the century brought with it the end of the French miniature; for the extravagant productions of the 16th century cannot be counted as worthy of consideration.

The French miniature went down before the Flemish school, which in the latter part of the 15th century attained to its highest excellence. The Flemish miniature affected extreme softness and depth of colour; also an ever-increasing carelessness in the treatment of details, of the draperies, of the expression of the features; the Flemish type of the Virgin’s face, for example, with its full, high forehead, can never be mistaken. In the best Flemish miniatures of the period the artist succeeds in presenting a wonderful softness and glow of colour; nor did the high standard cease with the 15th century, for many excellent specimens still remain to attest the favour in which it was held for a few decades longer.

In the foregoing remarks what has been said in regard to the careful treatment of details applies still more to the miniatures executed in grisaille, in which the absence of colour invited an even stronger accentuation of that treatment. This is perhaps most observable in the grisaille miniatures of northern Flanders, which often suggest, particularly in the strong angular lines of the draperies, a connexion with the art of the wood-engraver.

The Flemish miniature did not, however, hold the favour of western Europe without a rival. That rival had arisen in the south, and had come to perfection concurrently with the miniature of the Low Countries in the 15th century. This was the Italian miniature; and the history of its development now claims a brief notice. We return to the 13th century, where we suspended examination of the work of the school of the miniature painters of Italy; but we are not in a position, from lack of material, to follow so closely the development of the Italian miniature. Yet there is enough to show that it passed through the same stages as the miniatures of England and France and the Low Countries. Intercommunication between the countries of Europe was too well established for the case to be otherwise. In Italian MSS. of the normal type the influence of Byzantine art is very manifest during the 13th and 14th centuries. The old system of painting the flesh tints upon olive green or some similar pigment, which is left exposed on the lines of the features, thus obtaining a swarthy complexion, continued to be practised in a more or less modified form into the 15th century. As a rule, the pigments used are more opaque than those employed in the northern schools; and the artist trusted more to colour alone to obtain the desired effect than to the mixture of colour and gold which gave such brilliant results in the diapered patterns of France. The vivid scarlet of the Italian miniaturists is peculiarly their own. The figure-drawing does not bear comparison with the contemporary art of English and French MSS., the human form being often stunted and thick-set. In general, the Italian miniature, before its great expansion in the 14th century, is far behind the miniatures of the north. But with the 15th century, under the influence of the Renaissance, it advanced into the front rank and rivalled the best work of the Flemish school. The use of thicker pigments enabled the miniaturist to obtain the hard and polished surface so characteristic of his work, and to maintain sharpness of outline, without losing the depth and richness of colour which compare with the same qualities in the Flemish school.

The Italian style was followed in the MSS. of Provence in the 14th and 15th centuries. It had its effect, too, on the school of Provence, but from France, by which it was also influenced in turn.

In the MSS. of Italy and Provence there is no great national influence. But the principles which have been reviewed as guiding the development of the miniature in the more important schools apply equally to all. Like the miniature of the Flemish school, the Italian miniature was still worked to some extent with success, under special patronage, even in the 16th century; but with the rapid displacement of the manuscript by the printed book the miniaturist’s occupation was brought to a close.

For Authorities see under ILLUMINATED MSS. (E. M. T.)

2. Miniatures as Separate Small Pictures.—In Europe the later development of the miniature, applied almost exclusively to portraits, is of a large extent English, and the greater number of the chief masters in the art have been Englishmen or have lived in England. Several great portrait painters are said to have worked occasionally in miniature, and there are paintings, small in size attributed with good reason to Holbein, Antonio Moro, John Shute, Cleef, Stretes, Teerlink, Zuccho, John and T. Betts, and with less probability even to Van Dyck. There is a fine signed work by Shute (see Lomazzo’s Trattato dell’arte della pittura, trans. Heylock, 1598) in the Pierpont Morgan collection; examples by Betts at Montagu House and Madresfield Court, and portraits, by Lavina Teerlink in the collections of Mr George Salting and Mr J. Pierpont Morgan.

The first portrait miniaturist about whom anything definite is known was Nicholas Hilliard (c. 1547–1619), whose work partakes of the characteristics of illuminated manuscripts. The colours are opaque; gold is used to heighten the effect; while the paintings are on card. They are often signed, and have frequently also a Latin motto upon them. It has recently been proved that Hilliard worked for a while in France, and he is probably identical with the painter alluded to in 1577 as one of the artist’s assistants. Nicholas Hilliard was succeeded by his son Lawrence (d. 1640), some works by whom are in the Pierpont Morgan and Madresfield Court collections. His technique was similar to that of his father, but bolder, and his miniatures richer in colour. Isaac and Peter Oliver succeeded Hilliard. Isaac (d. 1672) is said to have been the pupil of Hilliard and Zuccho. Peter (1594–1647) was the nephew of Isaac. The two men were the earliest to give roundness and form to the faces they painted. They signed their best works in monogram, and painted not only very small miniatures, but larger ones measuring as much as 10 in. by 9 in. They copied for Charles I. on a small scale many of his famous pictures by the old masters. Several of these copies are at Windsor and at Montagu House. At about the same date Gerber, Poelemberg, Jamesone, Penelope Cley and her brothers, were workers in the art. John Hoskins (d. 1664) was the master of Samuel Cooper, the greatest English miniaturist. The work of Cooper can best be studied in the collection at Ham House. He was followed by a son of the same name, who was known to have been living in 1700, since a miniature signed by him and bearing that date is in the Pierpont...

Marshall Hall Collection.

Collection of the King of Sweden.
MINIATURE

Morgan collection. It represents the duke of Berwick. Samuel Cooper (1609–1672) was a nephew of Hockins. He spent much of his time in Paris and Holland, and very little is known of his career. His work has a superb breadth and dignity, and has been well called “life-size work in little.” His portraits of the men of the Puritan epoch are remarkable for their truth to life and strength of handling. He painted upon card, chicken skin and vellum, and on two occasions upon thin pieces of mutton bone. The use of ivory was not introduced until long after his time. His work is frequently signed with his initials, generally in gold, and very often with the addition of the date. Flatman (d. 1688); Alexander Cooper (d. 1666), who painted a series of portraits of the children of the king and queen of Bohemia, now belonging to the German emperor, and several of whose best miniatures are in the collections of the queen of Holland and the king of Sweden; David des Oranges (1661–1675) whose work can be seen at Ham House and Windsor Castle; R. Gibson (1751–1815), Mrs Rosse; his daughter, who for many years imitated the work of Samuel Cooper, and Charles and Mary Beale, deserve notice at this period. They are followed by such artists as Lawrence Crosse (d. 1724), Gervase Spencer (d. 1763), Lens, Nathaniel Hone and Jeremiah Meyer, the latter two notable in connexion with the foundation of the Royal Academy. The workers in black lead (plumbago, as it was called at that time) must not be overlooked, especially David Loggan, Faithorne, White, Forster and Faber. They drew with exquisite detail and great effect on paper or vellum. The 18th century produced a great number of miniature painters, of whom Richard Cosway (1742–1821) is the most famous. His works are of great beauty, and executed with a dash and brilliance which no other artist equalled. His best work was done about 1799. His portraits are generally on ivory, although occasionally he worked on paper or vellum, and he produced a great many full-length pencil drawings on paper, in which he either showed the faces and hands alone in his “stayed” drawings. Cosway’s finest miniatures are signed on the back; there is but one genuine signed on the face; very few bear even his initials on the front. George Engleheart (1750–1829) painted 4000 miniatures, and his work is stronger and more impressive than that of Cosway; it is signed “E” or “G.E.” Andrew Plimer (1763–1837) was a pupil of Cosway, and both he and his brother Nathaniel produced some lovely portraits. The brightness of the eyes, virility of the hair, exuberance of colour, combined with forced chiaroscuro and often very inaccurate drawing, are characteristics of Andrew Plimer’s work. John Smart (1741–1811) was in some respects the greatest of the 18th-century miniaturists. His work excelled in refinement, power and delicacy; its silky texture and elaborate finish, and the artist’s love for a brown background, distinguish it. Other notable painters were Oraz Humphry (1742–1810), Nixon (c. 1750–1808), whose best pictures are groups of two or more persons, William Wood, a Suffolk artist (1768–1808), Edridge (1769–1821), Sullivan, Sheriff, Crosse, Bogle, Daye. In the 19th century J. C. D. Engleheart (1784–1862), nephew of George: Andrew Robertson (1772–1845), Beaumont, Behnes, Harlow, Heaply and Mrs Mee must be mentioned. Sir Thomas Lawrence painted a few miniatures, and Raeburn some in his early days; but the art may be said to have died out with Sir William Ross, the Chalons and Newton, although some works by Landseer in this form are in existence, some small paintings of flowers by George Lance, and one portrait by Rossetti. Towards the end of the 19th century came a revival of miniature painting, but without producing any masters of the same calibre. Alyn Williams and Lloyd amongst Englishmen, J. W. von Kehling-Quistgaard, the talented Danish miniature painter, and Bess Norris, an Australian artist, deserve mention. From about 1860 onwards many fine miniatures were executed in enameled. Petitot (1657–1691) was the greatest master in this material, and painted his finest portraits in Paris for Louis XIV. His son succeeded him in the same profession. Other artists in enamel were Boit (d. 1727), Zincke (d. 1767), Hurter (1734–1790), Thouron (1737–1789), Liot, Prieur, Spicer, Dinglinger, Voquer, Bain and Thiempanda. Many of these artists were either Frenchmen or Swiss, but most of them visited England and worked there for a while. The greatest English enamel portrait painter was Henry Bone (1755–1836), the fancies of whose productions are now at Kingston Lacy. A great collection of his small enamel reproductions of celebrated paintings is in Buckingham Palace.

The earliest French miniature painters were Jean Cloutet (d. c. 1540), his son François, Jean Fouquet, Jean Perreal and others; but of their work in portraiture we have little trace at the present day, although there are many portraits and a vast number of drawings attributed to them with more or less reason. The seven portraits in the manuscript of the Gallic War (Bibliothèque Nationale) are assigned to the elder Cloutet; and to them may be added a fine work, in the Pierpont Morgan collection, representing the Mariarchal de Brissac. Following these men we find the two Stréors, St André, Cotelle and Massé; the fine draughtsmen Picart, Vauthier and Chérond; and the most distinguished are the Frenchmen, such as F. J. Gerard, who painted miniatures by Largillière, Boucher, Nattier, Montpetit, Desfosses, Drouais, Chardin, Thouret, Perrin and Dubourg; but the greatest names among those of Hall the Swede, Dumont the Frenchman, and Füger the Austrian. The tiny pictures painted by the von Blarenberghe family are by many persons grouped as miniatures, and some of the later French artists, as Prud’homme, Constance Meyer and Dubois, executed miniature portraits, while others whose names might be mentioned were Werner (1637–1710), Rosalba (1657–1757), Chantillon, Pasquier, Marsigli, Garriot, Sicardi and Festa. The most popular artists in France, however, were Augustin (d. 1832) and Isabey (d. 1855). Their portraits of Napoleon and his court are exceedingly fine, and perhaps no other Frenchman painted miniatures so well as did Augustin. The Spanish painter Goya is known to have executed a few miniatures. Miniatures are painted in oil, water-colour and enamel, but rarely both in water-colour. Many Dutch and German miniatures were painted on gold, and although these are on copper; and there are portraits in the same medium, and on the same material, attributed to many of the great Italian artists, notably those of the Bologna school. Samuel Cooper is said to have executed a few paintings in oil on copper, but we know little about the artists who prepared the numerous oil portraits in foreign collections.

The work of the 18th century on ivory is, of course, in watercolour. The use of ivory came into general adoption in the early part of the reign of William III, miniatures previous to that time having been painted on vellum, chicken-skin or cardboard, a few on the backs of playing cards, and many more on very thin vellum closely mounted on to playing cards.

The most important collections of miniatures in England in 1907 were those in the possession of the king, the ducie of Buccleuch, Mr J. Pierpont Morgan, the duke of Rutland, the earls of Exeter, Exeter, Suffield, Derwent (notable for enamel work, some examples of which are of the greatest beauty); and Ancaster (especially notable for works by Cosway), of Earl Beauchamp, the late Baroness Burdett-Coutts, Sir Gardner Engleheart (remarkable for containing the whole family of the Engleheart), Sir John Hustler, Beckford (notable for works by Cosway), of Earl Beckford, the late Baroness Burdett-Coutts, Sir Gardner Engleheart (remarkable for containing the whole family of the Engleheart), Lord Wodehouse, and Messrs Drake, Digby, Wodehouse, Engleheart and others.

Lincoln. There is a remarkable collection, principally in enameled, in the University Gallery, Oxford, a few fine miniatures in the collection of Portman in the National Portrait Gallery, Kensington, and in the same museum in the Jones collection some splendid pieces. In Scotland there is a superb but very mixed collection in Peter the Great’s Gallery in St Petersburg, unfortunately in great confusion and needing rearrangement. Many fine miniatures, including some very scarce enamelled work by Prieur, are at the Rosenborg Palace in Copenhagen; the German emperor and the Crown of Prussia both own some remarkable examples, and there are important collections at Vienna, Florence and Stockholm, and in private hands in Berlin, Moscow and elsewhere.
MINIM-MINING

MINIM (adapted from Lat. minimus, the smallest; a superlative from the Indo-Germanic root min-, small), the smallest possible part of a thing, a particle. In music the name “minim” (nota minim) was given by medieval musicians to a note whose value was half a semibreve. It was, as its name implies, the note of the shortest duration then in use. In modern music several notes of lesser value, as the “quaver,” have been added, and the minim is now about half-way in the scale of “values.” According to Thomas Morley (A Plain and Easilie Introduction to Practical Music, 1597), its introduction into manuscript music is ascribed to Philipus de Vitiaco, a musician of the 14th century.

In medicine a minim is the smallest fluid measure, being equal to one drop. Sixty minims make a fluid dram.

For the religious Order known as “Minims” see Francis of Paola, St.

MINING, the general term for the working of deposits of valuable mineral. The term is not limited to underground operations, but includes also surface excavations, as in placer mining and open-air workings of coal and ore deposits by methods similar to quarrying, and boring operations for oil, natural gas or brine. Mining may be subdivided into the operations of prospecting or search for minerals, exploration and development, work preparatory to active operations, and working. The latter includes not only the actual excavation of the mineral, but also haulage and hoisting by which it is brought to the surface, timbering and other means of supporting the excavations, and the drainage and ventilation of mines. Finally, under the heads of administration, mine valuation, mining education, and mining hygiene, would fall all matters having important bearing on mining operations. Special methods of mining are dealt with in separate articles on Coal, Gold, and other minerals and metals. Quarrying and Ore-Dressing, which may be considered as branches of mining, are also discussed in separate articles.

Prospecting.—In the article on MINERAL DEPOSITS (q.v.) the distribution and mode of occurrence of the useful minerals and ores are fully discussed. The work of prospecting is usually left to adventurous men who are willing to undergo privation and hardship in the hope of large reward though the chances of success are small. The prospector is guided in his search by a knowledge of the geological conditions under which useful minerals occur. When the rocks are concealed by detrital material he looks for outcroppings on steep hillsides, on the crests of hills or ridges, in the beds of streams, in landslides, in the roots of overturned trees, and in wells, quarries, road-cuttings and other excavations. When the solid rock is not exposed the soil sometimes furnishes an indication of the character of the underlying rock. Sometimes the vegetation, shrubs, trees, &c., as characteristic of certain soils, may furnish evidence of the nature of the rocks. The search should be made in the beds of streams and on the hillsides for “float mineral” or “shodd stones,” fragments of rocks and minerals known to be associated with and characteristic of the deposits. Fragments of coal, or soil stained black with coal, will be found near the outcrop of coal beds. Grains of gold or particles of ore may be detected by washing samples of gravel in a prospector's pan. By tracing such indications up the stream or up the hillside the outcrop may sometimes be found, or at least approximately located. The outcrop of a mineralized vein is frequently marked by its staining as a line of rocks stained with oxide of iron, often honeycombed and porous, the “gossan” or “eisen-hut,” the iron oxide of which results from the decomposition of the pyrites, usually present as a constituent of such veins. Other metals, such as manganese, copper, nickel, may show their presence by characteristic colours. Finally, the surface topography will often throw much light on the underground structure.

The shape of the hills and ridges is necessarily influenced by the inclination of the strata, by the relative hardness of different rock-beds, and by the presence of folds and fissures and other lines of weakness. A quartz vein or bed of hard rock may show itself as a sharp ridge or as a well-defined bench; a stratum of soft rock or the line of a great fissure, or the weakening of the strata by an anticlinal fold, may produce a ravine or a deep valley. The bed of fire-clay under a coal seam, being imperious to water, frequently determines the horizon of numerous springs issuing from the hillsides. As the coal and the associated rocks usually contain pyrites, these springs are often chalybeate. When the location of the deposit has been determined approximately, further search is made by trenches or pits or borings through the surface soil.

Exploratory Work.—Before opening and working a mine it is necessary to have as full and accurate information as possible to the following:

1. The probable extent and area of the deposit, its average thickness, and the probable amount and value of the mineral;
2. The distribution of the workable areas of mineral in the deposit;
3. Conditions affecting the cost of opening, developing and working the mine or determining the methods to be adopted.

Work undertaken to secure this information must be distinguished from prospecting, which is the search for mineral deposits and from development, work undertaken to prepare for actual mining operations. Exploratory work is associated intimately both with prospecting and with development, but the purpose is quite distinct from either prospecting, development or working, and it is of importance that this should be clearly recognized. It must be remembered that the line between a workable deposit and one that cannot be profitably worked is often very narrow and that the majority of mineral deposits are not workable. The money that is spent in prospecting and in development is therefore liable to prove a loss. This is a recognized and legitimate business risk, differing only in degree from the risks attending all business operations. The risk of failure in mining enterprises is offset by the chances of more than ordinary profits. If the property proves valuable the returns may be very great. While the risk of loss of capital is not to be avoided, it is of the utmost importance to limit the amount of money expended while the extent and value of the deposit is still uncertain and to do the necessary work by the cheapest methods consistent with thoroughness. As the information as to the character and extent of the deposit becomes more definite, and as the prospects of success become more favourable, money may be spent more freely. The risk will vary with the character of the deposit. In the case of the cheaper and more abundant minerals, such as coal and iron ore, and of large deposits of low-grade ores, the extent and character of the deposit can generally be determined by surface examinations at comparatively small expense. On the other hand, in the case of less regular deposits, including most metalliferous veins, and especially those of the precious metals, the uncertainty is often very great, and it is sometimes necessary to work on a small scale for months before any considerable expenditure of money is justified.

The quickest and cheapest method is by surface explorations. The work of the prospector frequently furnishes much of the information required. By sinking additional pits or by extending the costeauing trenches and uncovering the outcrop of the deposit more fully it is sometimes possible to obtain all the
information required for the most extensive and important mining operations. Even when the outcrop is oxidized, and the mineral character and richness of the deposit is altered thereby, it is possible to determine variations in thickness and the extent and distribution of the rich and barren areas by surface explorations. Information of this sort obtained by surface exploration is often as conclusive as similar information obtained from underground workings. If the deposit shows great variations in thickness in its outcrop along the surface it is probable that a drift or a slope would show the same thing in depth. If the workable areas are poor, and appear only at long intervals along the outcrop, the chances of discovering richer areas by a shaft are very small.

In many cases underground exploration is necessary. For example, the deposit does not outcrop as in the case of blind veins and flat deposits below the general level of the country; or the outcrop lies beyond the limits of the property or under water or water-bearing formations, or is covered by quicksand, or is deeply buried. For such buried deposits boring is cheaper than sinking. In the case of coal, salt, iron ore, pyrite and other homogeneous minerals, boring may give all the information required. With a number of holes the average thickness and probable extent of the deposit may be determined, at least approximately. When the deposit is vertical or steeply inclined, horizontal or inclined bore-holes will be necessary. This will increase the cost of boring and will render the holes more likely to swerve from the true direction. In the case of metalliferous deposits of varying thickness or of irregular distribution the information from bore-holes is less satisfactory. A large number of holes must be bored to obtain, even approximately, the average thickness and value of the ore and the shape and size of the ore bodies. In extreme cases the results from boring are likely to be untrustworthy and misleading unless the work is done on such a scale that the cost becomes prohibitory.

While the information obtained by surface explorations is always valuable, and sometimes conclusive, as to the value of the deposit, it is usually necessary to supplement these results by underground explorations. Of a metalliferous vein is generally more or less altered by oxidation, and often a part of the valuable mineral has been converted into a soluble form and leached out. These conditions sometimes extend to a considerable depth. Below the oxidized outcrop the vein is often increased in value by secondary enrichment, sometimes to a depth of several hundred feet. In the case of such altered deposits surface exploration alone is likely to be misleading, and it is important to push the underground exploration far enough to reach the unaltered part of the deposit, or at least deep enough to make it certain that there is a sufficient quantity of altered or enriched ore to form the basis of profitable mining operations. As the sinking of shafts or the driving of narrow entries or drifts is expensive, and as the mineral extracted rarely pays more than a small fraction of the cost involved, it is usual to plan this exploratory work so that the openings made shall serve some useful purpose later.

The mistake is often made of sinking large and expensive shafts, or driving costly tunnels, before it is fully proved that the deposit can be worked on a scale to warrant such developments, and, indeed, too often before it is known that the deposit can be worked at all; and in too many cases large amounts of money are thus unnecessarily lost by over-sanguine mine managers.

It is, however, often advisable that the money spent in surface or underground exploration should at the beginning be spent for information alone. The information so gained not only determines the value of the deposit, but also serves to indicate the best methods of development and of working. The money so spent, if judiciously used, insures the undertaking against loss by diminishing the mining risk, and is thus analogous to premiums paid to insure against fire or other sources of loss.

Development.—As soon as it appears reasonably certain that the property is workable the mine will be opened by one or more shafts, drifts or tunnels, and the underground passages for active mining operations will be started. A drift or entry is a horizontal passageway starting from the outcrop and following the deposit. The former term is used in metal-mines and the latter in coal-mining. A tunnel differs from a drift in that it is driven across the strata to intersect the deposit. Either may be used for drainage of the mine workings, in which case it becomes an adit. A mine should always be opened by drift or entry if practicable, as thereby the expense of hoisting and pumping is avoided. Drifts, entries and tunnels find their chief application in mining regions cut by deep valleys. When, however, the deposit lies below the surface the mine must be opened by a shaft. If the outcrop of the vein or bed is accessible the shaft may be inclined and sunk to follow the deposit. This is in general a cheaper and quicker method of development for inclined deposits than by a vertical shaft, and it has the added advantage that much information as to the character of the deposit is obtained as the shaft is sunk. When the deposit lying below the surface is horizontal, or nearly so, or when the outcrop of an inclined deposit is not accessible, a vertical shaft will be necessary. Vertical shafts are better adapted to rapid hoisting, and have therefore somewhat greater capacity, than inclined shafts. They are to be preferred also for very deep shafts, or for sinking in difficult ground. Drifts and inclined shafts following the deposit may prove difficult of maintenance when the workings become large and settlement of the overlying strata begins. Large pillars of mineral should be left for the protection of the main openings, whether these be shafts or adits. In the case of very thick beds and mass deposits the main shaft or tunnel will preferably be located in the foot-wall.

Figs. 1 and 2 illustrate the development of a metal-vein by two adits, two inclined shafts in the lode, and by a deep vertical shaft connected with the lode by horizontal cross cuts. The stippled areas represent the ore shoots and the white areas the barren portions of the lode. The levels are supposed to be at fathoms (60 ft.) apart. As the mine is opened the deposit is subdivided into blocks of convenient size by parallel passages, which form later the main haulage roads, and by transverse openings for ventilation. In metal-mines the main passages are known as levels, and these are connected at intervals by winzes or small shafts. In coal mines, entries and headings, bords and walls serve similar purposes. The size of the blocks or the distance between the main passages is determined mainly by considerations of convenience and economy in excavating and handling the
mineral, and by the possibility of supporting the roof long enough to permit the excavation of the mineral without unnecessary risk or expense. In metal mining, when the workable portions of the deposit are small and separated by unworkable areas, the levels serve also the purpose of exploration, and in such cases must not be so far apart as to risk missing valuable mineral. In coal-mines main entries are often 100 yds. apart, while in metal-mines the distance between levels rarely exceeds 50 yds. and sometimes is but 50 or 60 ft. In irregular and uncertain deposits this work of development should be kept at all times so far in advance of mining operations as to ensure a regular and uniform output. In some cases, where the barren areas are large, it may be necessary to have two or three years' supply of ore thus blocked out in advance. A mine, however, may be over-developed, which results in loss of interest on the capital unnecessarily locked up for years by excessive development, and involves additional cost for the maintenance of such openings until they are needed for active mining operations.

Working.—When the development of a mine has advanced sufficiently the operation of working or extracting the mineral begins. The method to be adopted will vary with the thickness and character of the deposit, with its inclination, and to some extent with the character of the enclosing rocks, the depth below the surface, and other conditions. The safety of the men must be one of the first considerations of the mine operator. In most civilized countries the safety of mine workers is guarded by stringent laws and enforced by the careful supervision of mine inspectors on behalf of the government. The method of mining adopted must secure the extraction of the mineral at a minimum cost. The principal item in mining cost is that of labour, which is expended chiefly in breaking down the mineral, either by the use of hand tools or with the aid of powder. Labour is also expended in handling the mineral in the working-places and in bringing it to the mine-mouth; it is brought to the surface. Narrow and contracted working-places are to be avoided, as in such places the cost of breaking ground is always large. Economy in handling makes it desirable to bring the mine-cars as near as may be to the point where the mineral is broken. This can be done in inclined deposits, it can often be done by the aid of mechanical appliances, though sometimes at an expense not warranted in the saving in the labour of loading. In steeply inclined beds the working-place can be so arranged that the mineral will fall or slide from the place where it is broken down to the main haulage road. The greatest difficulty is found where the inclination of the deposit is too great to permit the mine-cars to be brought into the working-place and yet not great enough to allow the mineral to fall or slide to a point where it can be loaded.

While it is always desirable to provide large working-places, the size of the working-place is limited by the thickness and strength of the overlying beds forming the roof or hanging wall of the mine. With thick and strong rocks the working-places may sometimes exceed 100 or even 200 ft. in width. Indeed in metal-mines 100 ft. is the usual distance from one level to the next. With weak and thin beds forming the roof the working-places are often not wider than 20 or 30 ft. as in most coal-mines. While the width of the working-place is thus limited by the strength of the roof, its length is determined by other considerations—namely, the rapidity with which the mining work can be conducted and the length of time it is practicable to keep the working-place open, and also by the increased difficulty of handling the minerals sometimes experienced when the workings reach undue length. In long-wall and in the work of mining pillars the roof will be supported on one side only, the overhanging beds acting as cantilevers. The working-place in such cases can be even narrower than in rooms or stopes, and there is also greater difficulty in supporting the roof because the projecting beds tend to break close to the point of support where the strain is greatest. This tendency is overcome by the use of timber supports so disposed as to ensure the breaking of the overhanging roof at a safe distance from the working-face and prevent the interruption of the work that might otherwise result.

While it is always desirable to work the deposit so as to extract the mineral completely, it frequently happens that this can only be done at greatly increased cost. In complete Extraction of Mineral. the case of cheap and abundant minerals and low-grade ore deposits it is sometimes necessary to sacrifice a considerable proportion of the mineral, which is left for the support of the overlying strata. A similar sacrifice in the shape of pillars is often necessary to support the surface, either to avoid injury to valuable structures or to prevent a flooding of the mine. As already noted large pillars must always be left to protect shafts, adits and the more important mine-passages necessary for drainage, ventilation and the haulage of mineral. In the early history of mining there was but little attempt at systematic development and working, and the mines were often irregular and tortuous. Fig. 3 is an old Mexican silver-mine of this type. In such mines the mineral was carried out on the backs of men, and the water was laboriously raised by a long line of suction-pumps, operated by hand, each lifting the water a few feet only. With but slight modifications permitting the use of pumps and hoisting-machinery equally simple methods of mining may be seen to-day when the deposit is of small extent. Fig. 4 is a portion of a mine which consists of a series of irregular chambers with the roof supported on small pillars left at intervals for the purpose. In the systematic mining of larger deposits, the simplest plan consists in mining large areas by means of numerous working-places under the protection of pillars of mineral left for the purpose, and later mining these pillars systematically, allowing the overlying rock beds to fall and fill the abandoned workings. In shallow mines the pillars are small and the saving of the mineral of minor importance. In deep mines the pillars may furnish the bulk of the product, and the control of the fall of the roof, so as to permit the successful extraction of the mineral, demands a well-schemed plan of operation. In the robbing of pillars, timber is necessary for the support of
the roof in the working-places, and later to control the fall of the roof while the pillars are mined. More effective support and control of the roof may be secured by the use of rock-filling alone or with timber. By the use of rock-filling it is even possible to displace with pillars of mineral; or, if pillars are left, the use of rock-filling greatly facilitates subsequent robbing operations. Rock-filling will be used whenever a large proportion of barren material must be mined with the ore. If rock-filling must be brought from the surface its use will generally be confined to mines in which it is difficult to support the roof in any other way. Rock-filling yields and becomes consolidated under heavy pressure, and therefore does not furnish a rigid support of the overlying strata, but rather a cushion to control and equalize the subsidence.

With soft material, pillars must be large, even at moderate depths below the surface, and it involves less labour to leave long rectangular pillars than to form numerous square ones. This leads to the adoption of the room and pillar system so common in coal-mining.

Fig. 5 is a mine in a bed of soft iron ore worked by a series of inclined shafts, from which long horizontal rooms branch off right and left.

The usual method of working metal-mines is by overhand and underhand stoping, using rock-filling or pillars of mineral to support the roof. Fig. 6 represents a portion of one of the Lake Superior copper-mines worked by overhand stoping. A stope is that portion of the working assigned to a party of miners, and the block of ground is usually divided into three or four stopes at varying heights above the main level, the lowest being known as the cutting-out stope, the others as the first and second back stopes in ascending order. In steep pitching beds sufficient excavated material is allowed to remain in the stope for the support of the machines and men, the excess being drawn out from time to time and loaded into cars. The rest of the mineral is allowed to remain until the stope has so far advanced that its support is no longer needed. This method of mining requires but little timbering, only a single line of timber and lagging over the level, called the stull. When the roof is weak, or when it is undesirable to leave so much ore in the stopes, false stulls are sometimes erected in the upper part of the stope. The ore below the false stulls can then be drawn out without waiting for the completion of the top stope. When the mineral does not stand well in the pillar it will be necessary to erect a line of timbers with lagging so as to sheathe the under-side of the pillar and prevent its falling. It is not desirable to leave large areas standing upon pillars in the mine, and as soon as the work on any level is completed the pillar below should be mined out as far as is safe, and the abandoned portion of the mine allowed to cave in and lessen the weight on the pillars elsewhere. The block or ground between levels is sometimes mined by underhand stoping (fig. 7). In this case the advanced drift is run underneath the pillar, and the ground below is mined in descending steps. This plan has the advantage of requiring little or no timbering when the mineral is strong enough to stand well in the pillars and when the hanging wall is good. The main haulage tracks are laid at the bottom of the stope, which thus forms the level. In this method of mining the different stopes must be kept close together; otherwise there is much added labour in shovelling the broken ore down to the main level. This method has the advantage of permitting the ore to be sent to the surface as fast as it is mined instead of being left for some months in the stopes for the men to stand upon. It has the disadvantage that the distance from one level to the next cannot usually be more than fifty feet without increasing greatly the chances of injury to the men from falling rock. The method is then practicable and safe only with exceptionally strong mineral and roof. In metal-mines producing abundant rock-filling the overhand method of stoping, illustrated in fig. 8, is used. In this the stoping contracts run vertically, and each party of contractors has one or more mills or timbered chutes through which the rich ore is conveyed to the level below and loaded in cars. The ore as mined is hand-picked and the barren material allowed to remain in the stope where it
falls. In this method of mining no pillars need be left under the levels, as the rock-filling gives sufficient support to the roof. This method of mining affords the maximum of safety to the miners.

In the working of thick deposits the block of ground between two levels is divided into horizontal sections or floors which are worked either from above downward or from the bottom upward; in the first case the separate floors are worked by one of the caving systems; in the second, generally with the aid of filling. Fig. 9 illustrates the working of a block of ground by the top-slice caving system. Above, the ground has been completely worked out from the surface, and the space formerly occupied by ore is now filled with the débris of the overlying strata which has caved in above the block of ore now being worked. There is considerable thickness of old timber left from the working of the upper levels.

This mat of timber forms a roof under the protection of which the mining of the ore proceeds downward by floor by floor. The working-floors are connected by winzes with the main haulage roads below. These winzes serve for ventilation, for the passage of the workmen, and for chutes through which the ore is dumped to the level below. The working out of each floor is continued until there is left a bed of ground having thickness. Haulage roads are driven in the ore so as to divide the floor into areas of convenient size. These separate areas are then mined in small rooms, each room being timbered as in mining under a weak roof rock. The room is driven in this way from one haulage road to another or to the boundary of the ore body. On completion of any room the timbers are withdrawn and the overlying mass of timber and rock is allowed to fall and a new room is started immediately alongside of the one just completed. In this way the whole floor is worked out and the mat of timber and overlying rock is gradually lowered and rests upon the top of the ore forming the floor below. Before abandoning a room it is usual to cover the bottom of the working-place with lagging-poles, which facilitate the mining of the floor below. In this manner one floor after another is worked until the floor containing the main haulage roads of the level below is reached. In the meantime a new level and a system of haulage roads have been driven a hundred feet below, and winzes have been driven upward to connect with the old level which is to be abandoned.

The floor containing these old haulage roads now becomes the top slice of the one hundred-foot block of ground below and is mined out as described. Several floors may be mined simultaneously, the workings in the upper floor being kept in advance of those below, so as to allow the broken mass above to become consolidated before it is again disturbed by the working places of the next floor. This system permits the complete extraction of the ore at moderate cost and without danger to the men.

The subdrift caving system, Fig. 10, differs from the top-slice system mainly in the greater thickness given to the working floors, which may be from 12 to 40 ft. in thickness, whereas in the top-slice system the height of the floor is limited by the length of the timbers used in the working-rooms, rarely over 8 or 10 ft. The subdrift system requires a smaller amount of narrow work in excavating the necessary haulage roads, and is therefore better adapted to hard ores in which such narrow work is expensive. The mining of each floor is carried on in sections with small working-places which are first driven of moderate height to their full length and width, leaving a back of ore above and pillars of ore between to support the upper portion of the upper layer or floor. These pillars and the back of ore above are then mined in retreating back towards the haulage road. The subdrift system is somewhat cheaper than the top-slice system, the output per man being greater.

The bottom-slice caving system of mining begins at the bottom of a hundred-foot block of ground, a floor being excavated under the whole area, leaving pillars of sufficient size to support the ground above. These pillars are then filled with blast holes which are fired simultaneously, permitting the whole block of ground to the level above to drop. A floor is then reopened in this fallen ore, leaving pillars for temporary support which are blasted out as before. This is the cheapest of the three caving systems, but is applicable only when the deposit lies between walls of very solid rock, as otherwise wall rock is liable to cave with and become mixed with ore, which adds greatly to the expense of handling.

When rock filling is available, as when the ore contains much barren material to be left behind in mining, the ore body is divided into blocks of convenient height as above, and these blocks are divided into floors, the bottom floor of each block however being attacked. Each floor is opened up by subsidiary haulage roads and worked out in small rooms which are timbered and filled with broken rock when completed. An adjoining room is next excavated and filled, and thus the whole floor is worked out and replaced with rock-filling. Work is then started on the floor above, the upper floors being connected with the main haulage roads by winzes which are maintained through the filled ground. Several floors can be mined simultaneously, the work in the lower floors being kept well in advance. Instead of mining in horizontal floors the filling method permits the ore to be mined in vertical chambers or slices which extend from one level to the next above and from one wall of the deposit to the other. When a chamber has been excavated and completely filled the slice adjoining is mined out, or at times a block of ground may be left untouched between two filled chambers and then mined out. In the latter case the top-slice caving method will usually be employed for the working of such intervening pillars. In order to lessen the cost of handling the rock-filling, the excavation sometimes takes the form of inclined working-places, parallel to the slope naturally taken by the rock when dumped from above into the working
which the ore is excavated in funnel-shaped pits, each of which connects with underground haulage roads by a shaft. The ore is mined in the ordinary way, by pick and shovel if soft, or by the aid of powder if necessary, and the funnel-shaped bottom of the pit is maintained at such an angle that little or no shovelling is required to bring the excavated material to the shaft. Before the bottom of these pits reaches the level of the haulage roads below, a new set of roads will have been driven at a lower level and connected with the excavations above by the shafts. The cost of mining by the milling method does not greatly exceed the cost of steam-shovel work. For the special methods by which placer deposits are mined see Gold.

**Underground Haulage.**—The excavated material is brought to the hoisting shaft, or sometimes directly to the surface, in small mine cars, moved by men or by animals, or by locomotives or wire-robe haulage. The size, shape and design of the cars depend on the size of the mine passage and the hoisting compartments of the shafts; on whether the cars are to be trammed by hand or hauled in trains; whether they are loaded by shovel or by gravity from a chute; and whether they are to be hoisted to the surface or used only for underground transport. The cost of underground haulage is lessened by the use of cars of large capacity. In the United States cars in the coal and iron mines hold from 2 to 4 tons. In Europe the capacity ranges from 1000 to 1500 lb, though the tendency is to increase the size of the cars used. In mines of copper, lead and the precious metals, in which the cars are moved by hand, the usual load is from 1200 to 3000 lb. These small cars are constructed so that the load may be dumped by pivoting the car bodies on the trucks. Larger cars are usually dumped by means of rotating or swinging cradles, the car bodies being rigidly attached to the axles or trucks. When loaded by shovel the car is made to economize labour. Wooden rails, protected by iron straps, are sometimes laid on underground roads for temporary traffic; but steel rails, similar to, though lighter than, those employed for railways are the rule. For hand tramming, animal and rope haulage, the rails weigh from 8 to 24 lb per yard, for locomotive haulage 30 to 40 lb. Grades are made, whenever possible, in favour of the load, and of such degree that the power required to haul out the loaded cars shall be approximately equal to that for hauling back the empty, viz., about $\frac{1}{2}$ of 1%. Sharp curves should be avoided, especially for mechanical haulage. Switches for turnouts and branches, &c., are similar to but simpler than those for railways.

In metal mines, where, as a rule, mechanical haulage is inapplicable, the cars are moved by men (trammers). This is expensive, but is made necessary by the small amount of material to be handled at any given point. The average speed of the cars, for hoisting pressure is from 1 to 25%. The grades must not be too great for brake control nor for the hauling back of the empty cars. Cars may thus be run through long adits or through branch gangways to some central point for making up into trains. Near the top and bottom of hoisting shafts the tracks are usually graded to permit the cars to be run to and from the shaft by gravity.

**Locomotive Haulage.**—This is applicable to large mines, where trains of cars are hauled long distances on flat or undulating roads of moderate gradients. Steam locomotives have been largely superseded by compressed air or electric locomotives. Compressed air locomotives are provided with cylindrical
steel tanks charged from a special compressor with air at a pressure of 500 to 700 lb per sq. in. The capacity of the tank depends on the power required and the distance to be traversed by a single charge of air.

The air passes through a reducing valve from the main to an auxiliary tank, in which the pressure is, say, 125 lb, and then to the driving cylinders. By using compressed air vitiation of the mine air is avoided, as well as all danger of fire or explosion of gas. Electric locomotives usually work on the trolley system, though a few storage battery locomotives have been successfully employed. Trolley haulage lacks the flexibility of steam or compressed air haulage, and is limited to main lines because the wires must be strung throughout the length of the line. By adopting modern non-sparking motors there is but little danger of igniting explosive gas. Electric and compressed air locomotives are durable, easily operated, and can be built to run under the low roofs of thin veins. Their power is proportioned to requirements of load and maximum gradient; the speed is rarely more than 0 or 8 m. per hour. Electric locomotives are in general more economical than either steam or compressed air.

For heavy gradients rope haulage has no rival, though for moderate gradients it is often advantageously replaced by electric and compressed air haulage. Gravity or self-acting planes are for lowering loaded cars, one or more at a time, from a higher to a lower level. The minimum grade is that which will enable the loaded cars in travelling down the plane to pull up the empty cars. At the head of the plane is mounted a drum or sheave, and around it passes a rope, one end of which is attached to the loaded cars at the top, the other to the empty cars at the foot. The speed due to the excess of weight on the loaded side is controlled by a brake on the drum. The rope is carried on rollers between the rails. There may be two complete lines of track or three lines of rails, one being common to both tracks, and the cars passing on a middle turnout or "parting," or a single track with a parting. An engine plane is an inclined road, up which loaded cars are hauled by a stationary engine and rope, the empty cars running down by gravity, dragging the rope after them. This is similar to shaft hoisting, except that the grades are often quite flat. In the tail-rope system of haulage, by adapting a single track road, there are two ropes—a main and a "tail" rope—winding on a pair of drums operated by an engine. The loaded train is coupled to the main rope, and to the rear end is attached the tail-rope, which reaches to the end of the line, passing there around a large grooved sheave and thence back to the engine. By winding in the main rope the loaded cars are hauled towards the engine, dragging behind them the tail-rope, which unwinds from its drum. The trip being completed, the empty train is hauled back by reversing the engine. The ropes are supported between the rails and guided on curves by rollers and sheaves. High speeds are often attained. Branches, operated from the main line, are readily installed. In the endless rope system the rope runs from a grip wheel on the driving engine to the end of the line, rounds a return sheave, and thence back to the engine. Chains are occasionally used. The line is double track and the rope constantly in motion, the cars being attached at intervals through its length by clips or clutches; the loaded cars move in one direction, the empty in the other. There are two modes of installing the system: either the rope passes above the cars and is carried by them, resting in the clips, or it is carried under the cars on rollers, the cars being attached by clips or a grip-carriage. (For details see Hughes, Text-book of Coal Mining, pp. 236-272; Hildenbrand, Underground Haulage by Wire Rope.)

Rope haulage is widely used in collieries, and sometimes in other mines having large lateral extension and heavy traffic. With the tail-rope system, cars are run in long trains at high speed, curves and branches are easily worked, and gradients may be steep, though undulating gradients are somewhat disadvantageous. In the endless rope systems cars run singly or in short trains. Curves are disadvantageous, unless of long radius, speed is relatively slow, and branch roads not so easily operated as with tail-rope. The tail-rope plant is the more expensive, but for similar conditions the cost of working the two systems is nearly the same. An advantage of the endless system is that the cars may be delivered at regular intervals.

Hoisting.—When the mine is worked through shafts, hoisting plant must be installed for raising the ore and handling men and supplies. On a smaller scale hoisting is also necessary for sinking shafts and winzes and for various underground services. As ordinarily constructed, a pair of horizontal cylinders is coupled to a shaft on which are mounted either one or two drums (fig. 12). The diameter of the cylinders is such that each alone is capable of starting the load. As the cranks are set 90° apart, there is no dead centre, and the engine is able to start under full load from any point of the stroke. This is important in mine hoisting,

which is intermittent in character and variable as to power and speed required. The cylinders are generally single-expansion, though compound engines are occasionally used for heavy work. The engine is direct-acting, the drums making one revolution for each double stroke. In geared hoists the drums are on a separate shaft, driven from the crank-shaft by tooth or friction gearing, and make one revolution for, say, 4 or 5 double strokes. The hoisting speed is therefore slower, and as less engine power is required for a given load the cylinders are smaller, though making more strokes per minute. Large and powerful geared hoists are not uncommon. The dimensions of the drum depend on the hoisting speed desired and the depth of shaft or length of rope to be wound. Drums are either cylindrical or conical. Conical drums (fig. 12) tend to equalize the varying load on the engine due to the winding and unwinding of the rope. On starting to hoist, the rope winds from the small towards the large end of the drum, the lever arm, or radius of the coils, increasing as the weight of
rope decreases. A similar equalizing effect is obtained by the use of flat rope and reel, the rope winding on itself like a ribbon. Tapering ropes, tail-ropes suspended from the cages, and other means of equalization, are also employed. If, for a two-compartment shaft, a pair of drums (or a single wide drum) be keyed to the engine shaft, with the ropes wound in opposite directions, the hoisting is "in balance," that is, the cages and cars counterbalance each other, so that the engine has to raise only the useful load of mineral, plus the rope. This arrangement allows no independence of movement: when the loaded cage is being hoisted the empty must be lowered. Independent drums, on the contrary, are loose upon their shaft, and are thrown on or off by tooth or friction clutches. The maximum load on the engine is thus greater and more power is required than for fixed drums. Steam consumption is economized, whenever possible, by throwing in the clutches of both drums and hoisting in balance. Fixed drums are best for mines in which the hoisting is done chiefly from one level; independent drums when there are a number of different levels. Hoisting engines are provided with powerful brakes and frequently with reversing gear. In deep shafts hoisting speeds of 3000 or 3500 ft. per minute are often attained, occasionally as much as 5000 ft.

Formerly hemp and also fibre ropes were commonly used. Except in a few instances these were long ago superseded by iron-wire ropes, which in turn have been replaced by steel because of its greater strength. For hoisting in deep shafts, and to reduce the weight of rope, tempered-steel wire of very high tensile strength (up to 250,000 or 275,000 lb. ultimate strength per sq. in.) is advantageously employed. A 1-in. ordinary steel rope has a breaking strength of about 32 tons, which, with a factor of safety of six gives a safe working load of 5:2 tons. A 1-in. plow-steel rope has breaking and working strengths respectively of at least 48 and 8 tons. Standard round temper steel ropes ratios of 150 to 1 or more are desirable. To prevent corrosion the rope should be treated at intervals with hot lubricant. With proper care a steel rope should last from two to three years.

A frame of wood or steel, erected at the shaft mouth, and carrying the grooved sheaves over which the hoisting ropes pass, is known as the head-gear (fig. 15). In Great Britain and her colonies it is also called the poppet-head or pit-head frame; in the United States head-frame or gallow-frame. Though it is small and simple in construction for light work, for heavy hoisting at high speeds massively framed towers, often 80 to 100 ft. in height, are built. Steel frames are more durable than those of wood, and have become common in nearly all mining countries, especially where timber is scarce. A German design is shown in fig. 16. The head-gear is often combined with ore-bins and machinery for breaking and sizing the lump ore previous to shipment to the reduction works.

Cages, running in guides in the shaft, are used for raising the cars of mineral to the surface (fig. 17). They may have one, two or more decks, usually carrying one or two cars on each deck. Multiple-deck cages are rarely employed except for deep shafts of small cross-section or when the mine cars (tubs) are small, as in many parts of Europe. In many mines the mineral is raised in skips (fig. 18), filled from cars underground and dumping automatically on reaching the surface. Skips are sometimes of very large capacity, holding 5, 7, and even 10 tons of ore; such are used, for example, in several shafts at Butte, Montana, in the Lake Superior copper district, and in South Africa. Fig. 18 is a small skip; the upper illustration showing position for dumping. The lower cut is of a skip for either ore or water; note valve in bottom. Hoisting buckets or kibbles are employed for small

**MINING** 535
scale work or temporary service, such as raising the material blasted in sinking shafts. They hold from a few hundred pounds up to 1 ton. In hoisting from great depths the weight of the rope, which may exceed that of the cage and dumping and loading stations are provided. Each stage has its own engine, rope and cage. The variations in engine load are thus reduced, and incidentally hoisting time is saved.

In shallow mines the men use the ladder-way in going to and from their work. This is sometimes the case also for considerable depths. It is more economical to save the men's strength, however, by raising and lowering them with the hoisting engines.

At mines with vertical shafts this is a simple operation. Cages of the size generally used in metal mines will hold from ten to fifteen and occasionally twenty men. The time consumed in lowering the men is shortened by the use of cages having two or more decks. These are common in Europe, and are sometimes employed in the United States and elsewhere in mines where the output is large and the shafts deep and of small cross section. While a shift of men is being lowered the miners of the preceding shift are usually raised to the surface in the ascending cages, the entire shift being thus changed in the time required for lowering. Nevertheless, in very deep and large mines the time consumed in handling the men may make serious inroads on the time available for hoisting ore.

At a few mines special man-cages are operated in separate compartments of the main safe by their own engines for the men, and for tools, supplies, &c. For inclined shafts, where the mineral is hoisted in skips, the operation of raising and lowering men may not be so simple. Even a large skip will hold but a few men, the speed is slower, and more time is required for the men to get into and out of the skip than to step on and off a cage. Moreover, skips are rarely provided with safety attachments, so that the danger is greater. When the shafts are deep and the number of miners large man-cars are sometimes employed. These are long frames on four wheels, with a series of seats like a section of a theatre gallery. Ordinarily 4 or 5 men occupy each seat, the car accommodating from 20 to 36 men. Such cars are in use at a number of deep inclined shafts in the Lake Superior copper district, where the depths range from 3000 to 5000 ft. or more. At a few mines (since safety catches cannot be successfully applied to man-cars) these conveyances are raised and lowered by separate engines and ropes. To replace the ore-skip expeditiously by the man-car when the shafts are to be changed a crane is often erected over the shaft as far as the one-skips are lifted from the shaft track—the hoisting rope being uncoupled—and the man-car put in its place and attached to the rope. This change may be made in a few minutes.

Formerly, at many deep European mines, and at a few in the United States, men were raised by means of "man-engines." A man-engine consists of two heavy wooden rods (like the rods of a Cornish pumping plant, placed parallel and close to each other in a special shaft compartment, and suspended at the surface from a pair of massive walking beams (or "bobs")). The rods are caused to oscillate slowly by an engine, one rising while the other is falling. Thus they move simultaneously in opposite directions through a fixed length of stroke, say from 10 to 12 ft. At intervals on the rods are attached small horizontal platforms, only large enough to accommodate two men at a time. As the rods make their measured strokes one of the miners, starting from the surface, steps on the first platform as it rises to the surface landing and is then lowered on the down stroke. At the end of the stroke, when his platform comes opposite another overlying platform on the other rod, he steps over on to the latter during the instant of rest prior to the reversal of the stroke. Descends with the second rod on this down stroke, steps again at the proper time to a platform of the first rod and so on to the bottom. The men follow each other, one by one, so that in a few minutes all the rod platforms in a deep shaft may be simultaneously occupied by men stepping in unison but in opposite directions from platforms of one rod to the other. Meantime, the men quitting work are ascending in a similar way, as there is room on each platform for two men at a time when passing each other. Man-engines were long used,
but are now practically abandoned in both Great Britain and the United States, and few remain in any of the mining regions of the world. Their first cost is great and they are dangerous for new men, as they require constant alertness, presence of mind, and a certain knack in using them. See Trans. Inst. Min. and Met. xi. 334, 345, 380, &c.; also Eng. and Min. Jour. (April 4, 1903), pp. 517 and 518.

Surface Handling, Storage and Shipment of Minerals.—To mine ore or coal at minimum cost it is necessary to work the mine plant at nearly or quite its full capacity and to avoid interruption and delays. When the mineral is transported by rail or water to concentration or metallurgical works for treatment, or to near or distant markets for sale, provision must be made for the economical loading of railway wagons or vessels, and for the temporary storage of the mineral product. For short periods the mineral may remain in the mine cars, or may be loaded into railway wagons held at the mine for this purpose. Cars, however, are too valuable to be used in this way for more than a few hours, and it is usual to erect large storage bins at the mine, at concentration works and metallurgical establishments, in which the mineral may be stored, permitting cars, wagons and vessels to be quickly emptied or loaded. In mining regions where water transportation is interrupted during certain months of the year the mineral must be stored underground, or in great stock-piles on the surface. In coal mining the market demand varies in different seasons, and surface storage is sometimes necessary to permit regular work at the mines. For coal, iron ore and other cheap minerals, mechanical handling by many different methods is used in loading and unloading railway wagons and vessels, and in forming the stock-piles and reloading the mineral therefrom. (See CONVEYOR and DOCKS; also G. F. Zimmer, Mechanical Handling of Materials, and Engineering Magazine, xiv. 275, xx. 157 and xxi. 657.)

Mine Drainage.—A mine which has been opened by an adit tunnel or drift drains itself, so far as the workings above the adit level are concerned. In many mining regions long tunnels have been driven at great expense to secure natural drainage. Under modern mining conditions drainage tunnels have lost much of their former importance. Taking into account the risk attending all mining operations, which make necessary large interest and amortization charges on the cost of a tunnel, it will in most cases be advisable to raise the water to the surface by mechanical means. Drainage channels are provided, usually along the main haulage roads, by which the water flows to a sump excavated at the pump shaft. In driving mine passages that are to be used for drainage, care is taken to maintain sufficient gradient. Siphons are sometimes used to carry the water over an undulating grade and thereby save the expense of a deep rock cutting. As the larger part of the water in a mine comes from the surface, the cost of drainage may be reduced by intercepting this surface water, and collecting it at convenient points in the pump shaft from which it may be raised at less cost than if permitted to go to the bottom. Water may be raised from mines by buckets, tanks or pumps. Wooden or steel buckets, holding from 35 to 200 gallons, are employed only for temporary or auxiliary service or for small quantities of water in shallow shafts. Tanks operated by the main hoisting engines, and of capacities up to 1,500 gallons or more, are applicable under several conditions: (1) When the shaft is deep, the quantity of water insufficient to keep a pump in regular operation, and the hoisting engine not constantly employed in raising mineral, the tank is worked at intervals, being attached temporarily to the hoisting rope in place of the cage. (2) For raising large volumes of water from deep shafts pairs of tanks are operated in balance in special shaft compartments by their own hoisting engine. With an efficient engine the cost per gallon of water is often less than for pumping. (3) For clearing flooded mines. As the water level falls the tanks readily follow it while at work, whereas pumps must be lowered to new positions to keep within suction distance. Self-acting tanks are occasionally built underneath the platforms of hoisting cages. Mine pumps are of two classes: (1) those in which the driving engine is on the surface and operates the pumps by a long line of rods passing down the shaft, commonly known as the Cornish system; (2) direct-acting pumps, in which the engine and pumping cylinders form a single unit, placed close to the point underground from which the water is to be raised. Cornish pumps are the oldest of the machines for draining mines; in fact, one of the earliest applications of the old Woolf and Newcomen engines in the 18th century was to pumps for deep mines. The engine works a massive counter-balanced walking-beam from which is suspended in the shaft a long wooden or steel rod, made in sections and spliced together. Attached to the rod by offsets are one or more plunger or bucket pumps, set at intervals in the shaft. All work simultaneously, each raising the water to a tank or sump above, whence it is taken by the next pump of the system, and finally discharged at the surface. The individual pumps are placed several hundred feet apart, so that a series is required for a deep shaft. The speed is slow—from 4 to 10 strokes per minute—but the larger sizes, up to 24 in. or more in diameter by 10 or 12 ft. stroke, are capable of raising millions of gallons per day. Cornish pumps are economical in running expenses, provided the driving engine is of proper design and the disadvantages incurred in conveying steam underground are avoided. Their first cost, however, is high and the cumbersome parts occupy much space in the shaft. Direct-acting pumps, first introduced (1841) by an American, Henry R. Worthington, are made of many different designs. Typically they are steam pumps, the steam and water cylinders being set tandem on the same bed frame, generally without fly-wheel or other rotary parts; they may be single cylinder or duplex, simple, compound or triple expansion, and having a higher speed of stroke are smaller in all their parts than Cornish pumps. For high heads the water cylinders, valves and valve chambers are specially constructed to withstand heavy pressures, water being sometimes raised in a single lift to heights of more than 2,000 ft. Condensers are always required for underground pumps. Sinking pumps, designed for use in shafts in process of sinking, are operated by wire ropes so as to be raised before blasting and promptly lowered again to resume pumping. Electrically driven pumps, now widely used, are convenient and economical. Mine pumps of ordinary forms may be operated by compressed air, and air-lift pumps have been successfully employed. Hydraulic pumping engines, while not differing essentially from steam pumps, must have specially designed valves in the power cylinder on account of the incompressibility of water. They can be used only when a supply of water under sufficient pressure is available for power. Centrifugal pumps, constructed with several stages or sets of vanes, and suitable for high lifts, have been introduced for mine service. When mine water is acid the working parts of the pump must be lined with or made of bronze or other non-corrosive material; or the acid may be neutralized by adding lime in the sump.

Ventilation.—The air of a mine is vitiated by the presence of large numbers of men and animals and of numerous lights, each of which may consume as much air as a number of men. In mining operations explosives are used on a large scale and the powder gases contain large quantities of the very poisonous gas, carbon monoxide, a small percentage of which may cause death, and even a minute percentage of which in the air will seriously affect the health. In addition to these sources of contamination the air of the mine is frequently charged with gas issuing from the rocks or from the mineral deposit. For example, carbon dioxide occurs in some mines, and hydrogen sulphide, which is a poisonous gas, in others. In coal-mines we have to deal with “fire-damp” or marsh gas, and with inflammable coal dust, which form explosive mixtures with air and frequently lead to disastrous explosions resulting in great loss of life. The gases produced by such fire-damp or dust explosions contain carbon dioxide and carbon monoxide in large proportion, and the majority of the deaths from such explosions are due to this “after-damp” rather than to the
explosion itself. The terrible effects of fire-damp have led to the adoption of elaborate systems of ventilation, as the most effective safeguard against these explosions is the dilution and removal of the fire-damp as promptly and completely as possible. Very large volumes of air are necessary for this purpose, so that in such mines other sources of vitiation are adequately provided against and need not be considered. In metal mines, however, artificial ventilation is rarely attempted, and natural ventilation often fails to furnish a sufficient quantity of air. The examination of the air of metal mines has shown that in most cases it is much worse than the air of crowded theatres or other badly ventilated buildings. This has a serious effect on the health and efficiency of the workmen employed, and in extreme cases may even result in increased cost of mining operations. The ventilation of a mine must in general be produced artificially. In any case whether natural or artificial means be employed, a mine can only be ventilated properly when it has at least two distinct openings to the surface, one an intake or "downcast," the other a chimney serving as an "upcast." Two compartments of a shaft may be utilized for this purpose, but greater safety is ensured by two separate openings, as required by law in most mining countries.

The air underground remains throughout the year at nearly the same temperature, and is warmer in winter and cooler in summer than the outside air. If the two openings to the mine are at different levels the difference in weight of the inside and outside air due to difference in temperature causes a current, and in the winter months large volumes of air will be circulated through the mine from this cause alone. In summer there will be less movement of air and the current will frequently be reversed. In a mine with shafts opening at the same level, natural ventilation once established will be effective during cold weather, as the downcast will have the temperature of the outside air, while the upcast will be filled with the warm air of the mine. In summer this will occur only on cool days and at night. When the temperature of outside and inside air becomes equal or nearly so natural ventilation ceases or becomes insignificant. In a mine with two shafts a ventilating current may result from other conditions creating a difference in the temperature of the air in either shaft—for example, the cooling effect of dropping water or the heating effect of steam pipes. Natural ventilation is impracticable in flat deposits worked by drifts and without shafts.

Ventilation may be produced by heating the air of the mine, as for example, by constructing a ventilating furnace at the bottom of an air shaft. The efficiency of such ventilating furnaces is low, and they cannot safely be used in mines producing fire-damp. They are sometimes the cause of underground fires, and they are always a source of danger when by any chance the ventilating current becomes reversed, in which case the products of combustion, containing large quantities of carbon dioxide, will be drawn into the mine to the serious danger of the men. On account of their dangerous character furnaces are prohibited by law in many countries.

Positive blowers and exhausting apparatus of a great variety of forms have been used in mines for producing artificial ventilation. About 1850, efficient ventilators of the centrifugal type were first introduced, and are now almost universally employed where the circulation of large volumes of air is necessary, as in collieries. The typical mine fan consists of a shaft upon which are mounted a number of vanes enclosed in a casing; the air entering a central side inlet is caught up by the revolving vanes and thrown out at the periphery by the centrifugal force thus generated. "Open-running" fans have no peripheral casing, and discharge freely throughout their entire circumference; in "closed" fans the revolving part is completely enveloped by a spiral casing opening at one point into a discharge chimney. Fans either force air into or exhaust it from the mine. The inlet opening of the pressure fan is in free communication with the outside air, the discharge connecting with the mine air-way; in the more generally used exhaust fan the inlet is connected with the air-way, the fan discharging into the atmosphere. Among the exhaust fans most widely employed is the Guibal. Many others have been introduced, such as the Capell (fig. 19), Rateau, Schiele, Pelzer, Hanarte, Ser, Winter, Kley, and Sirocco fans. The Waddle may be instanced as an example of the open fans. Slow-speed fans are sometimes of large dimensions, up to 30 and even 45 ft. diameter, discharging hundreds of thousands of cubic feet of air per minute. Occasionally, at very gassy and dangerous collieries, two fans and driving engines are erected at the same air shaft, and in case of accident to the fan in operation the other can be started within a few minutes.

Opposed to the motive force producing the air current is the frictional resistance developed in passing through the mine workings. This resistance is equal to the square of the velocity of the current in feet per minute, multiplied by the total rubbing or friction surface of the air-ways in square feet and by the coefficient of friction. The latter, determined experimentally, varies with different kinds of surfaces of mine workings, whether rough or smooth, timbered or unlined; it ranges from 0-00000001872 to 0-0000000217 lb per sq. ft., the latter being the value usually adopted. A certain pressure of air is required to maintain circulation against the resistance, and for a given volume per minute the smaller and more irregular the mine openings the greater must be the pressure. The pressure is measured by a "water-gauge" and the velocity of flow by an "anemometer." The power required to circulate the air through a mine increases as the cube of the velocity of the air current. To decrease the velocity, when large volumes of air are required, the air passages are made larger, and the mine is divided into sections and the air current subdivided into a corresponding number of independent circuits. This splitting of the air not only lessens the cost of ventilating, but greatly increases its efficiency by permitting the circulation of much larger volumes, and has the added advantage that the effect of an explosion or other accident vitiating the air current is often confined to a single division of the mine, and affects but a small part of the workings. The adjustment of the air currents in the different splits is affected by regulators which are placed in the return air-ways, and act as throttle valves to determine the volume of air in each case. The circulation of air in any given division of the mine is further controlled and its course determined by temporary or permanent partitions ("brattices"), by the erection of stoppings, or by the insertion of doors in the mine passages and by the use of special air-ways (see Coal). In devising a system of ventilation it is customary to subdivide the workings so that the resistance to the ventilating current in each split shall be nearly equal, or so that the desired amount of air shall be circulated in each without undue use of regulating appliances which add to the friction and increase the cost of removing the air. In addition to this it is desirable to take advantage of the natural ventilation, that is, to circulate the air in the direction that it goes naturally, as otherwise the resistance to the movement of the air may be
and less some of the softer rocks show a tendency to flow, as exhibited by the under-clay in deep coal-mines, which not infrequently swells up and closes the mine shafts. In the Mont Cenis tunnel a bed of soft granite was encountered that continued to swell with almost irresistible force for some months. The pressure developed was sufficient to crush an arched lining of two-foot granite blocks. Similar swelling ground is not infrequently met with in metal mines, as, for example, in the Phoenix copper mine in Houghton county, Michigan, where the force developed was sufficient to crush the strongest timber that could be used. In very deep mines this flowing of soft rock will doubtless add greatly to the difficulty of maintaining openings. What may happen in some cases is illustrated by the curious form of accident locally known as a "bump," which occurs in some of the deep coal-mines of England. In one instance (described by F. G. Meacham, Trans. Fed. Inst. M.E. V. 381), the force developed by the swelling under-clay broke through and lifted with the force and suddenness of an explosion a lower bench of coal 8 ft. thick in the bottom of a gangway 12 ft. wide for a length of 200 ft., throwing men and machinery against the roof and producing an air-wave which smashed through the whole depth of the mine. It is evident that the combined effect of internal heat and rock pressure will greatly increase the cost of mining at depths of 8000 or 10,000 ft., and will probably render mining impracticable in many instances at depths not much greater.

Mine Administration.—In organizing a mining company it must be recognized that mining is of necessity a temporary business. When the deposit is exhausted the company must be wound up or its operations transferred to some other locality. Mining is also subject to special risks beyond those connected with consideration of additional risks and uncertainties peculiar to itself. The vast majority of mineral deposits are unworkable, and of those that are developed a large proportion prove unprofitable. In addition mining operations are subject to a number of contingencies, including accidents, mine fires, flooding, and the caving-in of the workings. To provide for the repayment from the capital invested in a mining property and expended in development, and to provide for the depreciation of the property, amortization of investment, and other items, an amortization fund must be accumulated during the life of the mine. It is desired to continue the business of mining elsewhere, a similar fund must be created for the purchase, development and equipment of a new property to take the place of the original deposit when that shall be exhausted. If, for example, we assume a mine at ten years and the rate of interest at 5%, it will be necessary that the property shall earn nearly 13% annually—viz., 5% on the proceeds of the sinking-fund devoted to the amortization or the reserve fund. To cover the special risk a mining company should earn a higher interest than in ordinary business, and if we assume that the sinking fund be safely invested, we must compute the return on the capital invested on the basis of 5%. Assuming, for example, the life of the mine at ten years as before, it is the interest to be earned by the amortization fund at 3%, and that on the investment at 10% we shall find that the annual income should amount to 18.7% per year. These simple business principles do not appear to be generally recognized in the mining industry. The properties, and mines, whose earning capacity is accurately known, are frequently quoted on the stock markets at prices which cannot possibly yield enough to the purchaser to repay his investment during the probable life of the mine.

Mine Valuation.—The value of any property is measured by its annual profits. In the case of mining properties these profits are more or less uncertain, and cannot be accurately determined until the property has been in operation for some time. In many instances, indeed, profits are more or less uncertain during the whole life of the mine, and it is evident that the value of the mining property must be more or less speculative. In the case of mining properties the value of a mine is measured in many cases with absolute certainty—as when the extent of the mineral deposit and the volume of mineral can be measured. In other cases the life of the mine, like the value of the mineral, is more or less uncertain. This uncertainty is based on the fact that the life of a mine cannot be accurately determined with mathematical precision. In so far as developed, and assaying of the samples taken: (2) the measurement of the developed ore; (3) estimates of the probable amount of ore in the undeveloped part of the property; (4) estimates of probable profits, life of the mine, and determination of the value of the property. Where the deposit is a regular one, the value is of fairly uniform richness, the taking of a few samples from widely separated parts of the mine will often furnish sufficient data to
determine the value of the deposit. On the other hand in the case of uncertain and irregular deposits, the value of which varies between very wide limits, as, for example—in most metal mines and especially, micas of gold and silver—a very large number of samples must be taken—sometimes not more than two or three feet apart—in order that the average value of the ore may be known within reasonable limits of error. The sampling of a large mine of this character may cost many hundreds of pounds. This applies with even greater force to estimates of undeveloped portions of the property. If the deposit is regular and uniform, the value of undeveloped areas may sometimes be predicted with confidence. In the majority of instances, however, the estimates of undeveloped ore contain a large element of uncertainty. In order to determine the probable prospect and life of the mine a definite scale of operations must be assumed, the money required for development and plant and for working capital must be estimated, the methods of mining and treating the ore determined, and their probable cost estimated. Where the deposit is regular and the element of risk is low, we must adopt a high rate of interest on investments of capital in our computations of value—in some cases as high as 15, 15 or even 20%. Where the deposit is irregular and the future can be predicted with some degree of certainty, we may be justified in adopting in some cases possibly as low as 5%. The interest on the annual contribution to the sinking-fund or its equivalent should be reckoned at a low rate of interest, for such funds are assumed to be invested in perfectly safe securities. Allowance must be made for the period of development during which there are no contributions to the sinking-fund and within which no interest is earned on invested capital.

Mining Education.—It is necessary to have the work directed by men thoroughly familiar with the methods of the trade. The metallurgical and mechanical treatment of minerals; and he should have an engineering education, especially on mechanical and electrical lines. As he is called upon to construct lines of transport, both underground and on the surface, works for water-supply and drainage, and buildings for the handling, storage and treatment of ore, he must be trained to some extent as a civil engineer. As a foundation his education must be thorough in the natural and physical sciences and mathematics. In addition there have been established in many countries schools for the education of workmen, in order to fit them for minor positions and to enable them to work intelligently with the engineers. These mines' schools (Bergschule, école des mines, Bergakademie) have been established in most mining countries. A student of mining must receive thorough instruction in geology; the amount of practical instruction in the methods of prospecting, mining, geological and mechanical treatment of minerals; and he should have an engineering education, especially on mechanical and electrical lines. As he is called upon to construct lines of transport, both underground and on the surface, works for water-supply and drainage, and buildings for the handling, storage and treatment of ore, he must be trained to some extent as a civil engineer. As a foundation his education must be thorough in the natural and physical sciences and mathematics. In addition there have been established in many countries schools for the education of workmen, in order to fit them for minor positions and to enable them to work intelligently with the engineers. These mines' schools (Bergschule, école des mines, Bergakademie) give elementary instruction in chemistry, physics, mechanics, mineralogy, geology and mathematics and drawing, as well as in such details of the art of mining as will best supplement the practical information already acquired in underground work. The training of a mining engineer merely begins in the schools, and mining graduates should serve an apprenticeship before they accept responsibility for important mining operations. It is especially necessary that they gain experience in management of men, and in the conduct of the business details, which cannot well be taught in school.

Accidents.—Mining is an extra-hazardous occupation, and the catastrophes, which from time to time have occurred, have caused agencies to enforce their authority. While in some cases these laws are unnecessarily stringent and tend to restrict the business of mining yet on the whole they have had the effect of reducing greatly the loss of life and injuries of miners where they have been well enforced. This is evident from fig. 20, which shows the number of deaths in the coal and metal mines of Great Britain for a series of years. As will be seen from this diagram the most serious source of death and injury is not found in mine explosions, but in the falls of rocks and minor in the working places. This danger can be reached only in small degree by laws and inspection, for the safety of the men must depend upon the skill and care of the miners themselves and the officials in charge of the underground work. Great loss of life and injury occur through the ignorance, carelessness and recklessness of the men themselves, who fail to take the necessary precautions for their own safety, even when warned to do so.

Mining laws have proved chiefly serviceable in securing the introduction of efficient ventilation, the use of safety-lamps, and of proper explosives, to lessen the danger from fire and dust. Thus, in the coal-mines, the inspection of machinery for hoisting and haulage, and prevention of accidents due to imperfection in design or working the machinery.

Fire-damp and dust explosions are caused by the presence of marsh-gas in sufficient quantity to form an explosive mixture, or by a mixture of small percentages of marsh-gas and coal-dust, and in some cases by the presence of coal-dust alone in the air of the mine. Explosive mixtures of coal-mine and marsh-gas and air may be fired by an unprotected light. But when coal-dust is present, and little or no marsh-gas, an initial explosion, such as produced by a blown-out shot, is required. To guard against explosions from this cause it is necessary to use explosives in moderate quantities and to see that the blast holes are properly placed, so that the danger of blown-out shots may be lessened. In dry and dusty mines the danger may be greatly lessened by sprinkling the working places and passages, and the use of explosives. In some mines great quantities of fire-damp are present, safety-lamps of approved pattern must be used and carefully inspected daily. The use of matches and naked lights of any kind must be prohibited. To lessen the danger from blasting operations the use of special safety explosives is required in Great Britain and some European countries. The use of such explosives decreases to some extent the danger from dust explosions; but experiment shows that no efficient explosive is absolutely safe, if used in excessive quantity, or in an improper manner. Absolute security is impossible, as is proved by the many and serious disasters under the most stringent laws and careful regulations that can be devised.

Mine Fires.—Mine fires may originate from ordinary causes, but in addition they may result from the explosion of fire-damp or from the accidental lighting of jets of fire-damp issuing from the coal. In some mining districts the coal is liable to spontaneous combustion. A fire underground speedily becomes formidable, not only in coal but also in metal mines, on account of the large quantity of timber used to support the excavations. Underground fires may sometimes be extinguished by direct attack with water. The difficulty of extinguishing an underground fire in this way is, however, very great, as on account of the poisonous products of combustion it is impossible to attack it except in the rear, and even there the men are always in great danger from the reversal of the

Fig. 20.—Death-rate from various classes of accidents in and about all mines in the United Kingdom from 1873 to 1900.
burning coal, in order to reach the fire. When direct attack is no longer practicable, it is possible to extinguish the fire by sealing the mine workings, and exhausting the supply of oxygen. It is necessary, however, to keep the mines sealed until the burning timbers, or coal, and the gases and smoke have all been allowed to escape. This sometimes requires two or three months. Where an effective sealing of the mine is impracticable it is sometimes possible to extinguish the fire from the outside of the mine by constructing a large opening in the side of the mine, and suddenly releasing a large volume of water by opening discharge doors. The mass of water falling down the shaft is converted into spray, which is carried by the force of the fall long distances into the workings. Where the fire is in or near the shaft this method has proved very effective. Mine fires may sometimes be reached by bore-holes sunk for the purpose from the surface, and the burning workings below filled by flushing with culm and water. As a last resort, a large opening made in the side of the mine may be closed in and filled with sand or ash, and the operation as it entails the cost of pumping the water out again and repairing the resulting damage. If the fire is in working places to the rise the water may not reach the burning portions of the mine, but sufficient time must be allowed, to elapse before pumping out the water, as otherwise the fire may break out again. Mines may become flooded by the inrush of surface waters in times of great rainfall or sudden floods, or by the undermining of surface waters. The mine workings may also be flooded by large bodies of underground water. The surface floods must be provided with channels of sufficient size to carry the water, and the workings below them should be kept dry. The ditches should be excavated for this purpose, and dams and embankments constructed to divert the flood waters. That it is possible to work with safety beneath rivers, lakes and even the ocean has been proved in many instances. The early miners of the world having been extended long distances under the sea. In such cases preliminary surveys should be made to determine the thickness of rock over the proposed workings. Under favourable conditions mining may be carried on under the sea, and solid rock only, as in the submarine work for the removal of reefs in the harbours of San Francisco and New York. At Silver Islet, Lake Superior, mining was successfully carried on for years under the water, and at a depth of some 20 ft. thick. At Wheel Cock near St Just in Cornwall the protecting roof was so thin that holes bored for blasting more than once penetrated to the bed of the ocean, and wooden plugs were kept to plug the holes to prevent any escape of water. In storms the boulders could be heard striking each other overhead. When large areas are undermined, as in submarine coal mining, it is best to have several hundred feet of protecting rock. In Great Britain, as in other countries, large areas of works being of such length as to ensure a safe thickness of solid rock.

The caving in of mine workings results from the excavation of large areas supported upon pillars of insufficient size. While the mine workings are in progress the pillar, and the full pressure does not come upon the mine pillars. As the workings increase in size the pillars support an increasing weight until finally they are strained beyond their strength and break, and the weight of the broken material falls into solid strata. When large areas are undermined, as in asubmarine coal mining, it is best to have several hundred feet of protecting rock. In Great Britain, as in other countries, large areas of workings being of such length as to ensure a safe thickness of solid rock.

MINION—MINISTRY

1902); Periodical Publications—Annales des mines de Belgique (Brussels, quarterly); Australian Mining Standard (Melbourne, Sydney and Brisbane, weekly); Engineering and Mining Journal (New York, weekly); Glückauf (Essen, weekly); Mines and Quarries; General Reports and Statistics (London, annually); with details from official reports of colonial and foreign mining departments; Mines and Minerals (monthly, Scranton, Pennsylvania); The Mineral Industry (New York, annually); Transactions of the American Institute of Mining Engineers (New York); The Mining and Scientific Press (weekly, San Francisco); Transactions of the Institute of Mining and Metallurgy (London); Transactions of the Institution of Mining Engineers (Newcastle-on-Tyne).

MINION, a favourite, pet or spoiled person. The word is adapted from the Fr. mignon (Ital. mignonc), of which the origin is doubtful. Connexions with the O.H. Ger. minna, love, and with a Celtic root min-, meaning small, have been suggested. "Minion" is chiefly applied in a derogatory sense to the "creatures" of a royal court, and thus has been used of the favourites of Edward II. and James I. of England, and of Henry III. of France. In the sense pretty, delicate, dainty, the French form mignon or mignonnet is often used in English. During the 17th century "minion" was the name of a type of cannon with a small bore. In typograph, it is still used for the type which comes between "nonpareil" and "bravey."

MINISTER (Lat. minister, servant), an official title both civil and ecclesiastical. The word minister as originally used in the Latin Church was a translation of the Greek διάκονος, deacon; thus Lactantius speaks of presbyteri et ministri, priests and deacons (De mort. persecutorum, No. 15), and in this sense it is still technically used; thus canon vi., Sess. xxxii. of the council of Trent speaks of the hierarchy as consisting "ex episcopis, presbyteris et ministris." But the equivocal character of the word soon led to the blurring of any strict technical sense it once possessed. Bishops signed themselves minister in the spirit of humility, priests were "servants of the altar" (ministri altaris), while sometimes the phrase ministri ecclesiæ was used to denote the clergy in minor orders (see Lec Bajzar, ii. 8, quoted in Du Cange). A similar equivocal character attaches to the word minister as used in the Anglican formulae: "Oftentimes it is made to express the person officiating in general, whether priest or deacon; at other times it denotes the priest alone, as connected distinguished from the deacon" (Burn's Ecc. Law, ed. Phillimore, iii. 44). Thus the 33rd canons of 1603 orders that "no bishop shall make any a deacon and minister both together upon one day." Generally, however, it may be said that in the use of the Church of England "minister" means no more than executor officii, a sense in which it was used long before the Reformation. As the most colourless of all official ecclesiastical titles, it is easy to see how the word minister has come to be applied to the clergy of Protestant denominations. The phrase "minister of religion" is wide enough to embrace any evangelical office, and has about it more of the savour of humility than "pastor."

The civil title of minister originates in the same exact sense of servant, i.e. servants of the royal household (ministri aulae regis). This origin is still clearly traceable in the titles of some ministers in Great Britain, e.g. chancellor of the exchequer, first lord of the treasury, and in the official style of "his majesty's servants" applied to all. Practically, however, the word minister had, in modern states, come to be applied to the heads of the great administrative departments who such are members of the government. On the continent there are, besides, "ministers without portfolio," i.e. ministers who, without being in charge of any special department, are members of the government. In general it is distinctive of constitutional states that any public act of the sovereign must bear the countersignature of the minister responsible for the department concerned. (See the articles MINISTRY and CABINET. For the history and meanings of the word "minister" in diplomacy, see DIPLOMACY.)

MINISTRY, the office of a minister (q.v.), in all its meanings, political and religious, or the body of persons holding such an office and performing its duties; more particularly the body of persons who, in theory, the servants at the head of the state, act as the responsible executive over the whole sphere of government, as in the United Kingdom. On the continent of Europe, on the other hand, the word "ministry" is most usually applied to the responsible head of a particular department together with his subordinates, including the permanent officials or staff. In England, ever since the introduction of monarchial institutions the sovereign has always been surrounded by a select body of confidential advisers to assist the crown in the government of the country. At no period could a king of England act, according to law, without advice in the public concerns of the kingdom; the institutions of the crown of England and the institution of the privy council are coeval. At the Norman Conquest the king's council, or as it is now called, the privy council, was composed of certain members of the aristocracy and great officers of state, specially summoned by the crown, with whom the sovereign usually advised in matters of state and government. In the earlier stages of English constitutional history the king's councillors, as confidential servants of the monarch, were present at every meeting of parliament in order to advise upon matters judicial in the House of Lords; but in the reign of Richard II. the privy council dissolved itself with the king's wishes and assumed an independent jurisdiction of its own. It was in the reign of Henry VI. that the king's council first assumed the name of privy council, and it was also during the minority of this sovereign that a select council gradually emerged from the larger body of the privy council, which ultimately became the modern cabinet. Since the Revolution of 1688, and the development of parliamentary government, the privy council has dwindled into comparative insignificance. The power once swayed by the privy council is now exercised by that unrecognized select committee of the crown known as the cabinet (q.v.). The practice of consulting a few confidential advisers instead of the whole privy council had been resorted to by English monarchs from a very early period; but the first mention of the term cabinet council in contradistinction to privy council occurs in the reign of Charles I., when the burden of state affairs was entrusted to the committee of state which Clarendon says was exclusively called the "cabinet council." At first government by cabinet was as unpopular as it was irregular. Until the formation of the first parliamentary ministry by William III. the ministers of the king occupied no recognized position in the House of Commons; it was indeed a moot point whether they were entitled to sit at all in the lower chamber, and they were seldom of one mind in the administration of matters of importance. Before the Revolution of 1688 there were ministers, but no ministry in the modern sense of the word; colleague schemed against colleague in the council chamber, and it was no uncommon thing to see ministers opposing one another in parliament upon measures that in modern times would be supported by a united cabinet. As the change from government by prerogative to government by parliament, consequent upon the Revolution of 1688, developed, and the House of Commons became more and more the centre and force of the state, the advantage of having ministers in the legislature to explain and defend the measures and policy of the executive government began to be appreciated. The public authority of the crown being only conveyed through the medium of ministers, it became absolutely necessary that the advisers of the sovereign who were responsible for every public act of the Crown as well as for the general policy they had been called upon to administer, should have seats in both Houses of Parliament. Still nearly a century had to elapse before political unanimity in the cabinet was recognized as a political maxim. From the first parliamentary ministry of William III. until the rise of the second Pitt, divisions in the cabinet were constantly occurring, and a prime minister had more to fear from the intrigues of his own colleagues than from the tactics of the opposition. In 1812 an attempt was made to form a ministry consisting of men of opposite political principles, who were invited to accept office, not avowedly as a coalition government, but with an offer to the Whig leaders that their friends should be allowed a majority of one in the cabinet. This offer
was declined on the plea that to construct a cabinet on "a system of counteraction was inconsistent with the prosecution of any uniform and beneficial course of policy." From that date it has been an established principle that all cabinets are to be formed on some basis of political union agreed upon by the members when they accept office together. It is now also distinctly understood that the members of a cabinet are jointly and severally responsible for each other's acts, and that any attempt to distinguish between a particular minister and his colleagues in such matters is unconstitutional.

During the 19th century the power of ministers was greatly extended, and their duties became more distinctly marked out. As now interpreted, the leading principles of the British constitution are the personal irresponsibility of the sovereign, the responsibility of ministers, and the inquisitorial and controlling power of parliament. At the head of affairs is the prime minister (g.r.), whose duties are more general than departmental; and the other members of the administration, whose work is exemplified by the titles of their offices (the more important of which are treated separately), are the lord high chancellor, the lord president of the council, the lord privy seal, the first lord of the treasury, the five secretaries of state (home, foreign affairs, colonies, war, India), the chancellor of the exchequer, the secretary for Scotland, the chief secretary to the lord-lieutenant of Ireland, the postmaster-general, the presidents of the board of trade, the local government board, the board of agriculture and the board of education (all of which were originally committees of the privy council), the chancellor of the duchy of Lancaster and the first lord of the admiralty. These are the more important members of the administration, and they are generally in the cabinet. The subordinate members of the administration, some of whom are occasionally invited to join the cabinet, while others are never in it, are the parliamentary and financial secretary to the admiralty, the parliamentary under-secretaries of the home, foreign, war, and India offices, the board of trade, local government and board of education, the junior lords of the treasury (assistant "whips"), the financial secretary and patronage secretary to the treasury (the senior "whip"), the first commissioner of works, the paymaster-general, and the attorney-general and solicitor-general. There are in addition the lord advocate and the solicitor-general for Scotland, the lord-lieutenant and lord chancellor of Ireland (who are sometimes members of the cabinet), and the attorney-general and solicitor-general for Ireland.

MINISTRY

TABLE OF SECRETARIES OF STATE

[The substitution of two secretaries for one was the consequence of the increase of business. There was no distinction of departments, each secretary taking whatever work the king saw fit to entrust him. During the reigns of the first two Stuarts, however, there was a tendency to entrust one secretary with the correspondence with Protestant states and their allies, and the other with the correspondence with Catholic states. Probably in the reign of Charles II., and certainly as early as 1691, two departments, the Northern and the Southern, were instituted. In 1782 the departments were changed to Home and Foreign. A third secretary of state was appointed in 1794, and he was called the Secretary for War and the Colonies from 1801 to 1804, when the work was divided, and the War and Colonial Secretariats were instituted. The Secretary of State for India was appointed in 1858.]

1603. Sir R. Cecil, cr. Lord Cecil, Viscount Cranborne
1604, Earl of Salisbury 1605
1612. Vacant.
1614. Sir R. Winwood.
1618. Sir R. Hawesbury
1619. Sir R. Naunton.
1623. Sir E. Conway, cr. Lord Conway 1625.
1625. Sir A. Morton.
1628. Viscount Dorchester.
1632. Sir F. Windebank.
1641. Sir E. Nicholas.
1642. Viscount Falkland.
1643. Sir J. Trevor.
1654. Viscount Sidney.
1668. Henry Coventry.
1669. Sir J. Trenchard.
1674. Sir J. Williamson.
1675. Earl of Sunderland.
1676. Sir W. Trumbull.
1697. J. Vernon.
1700. Sir C. Hedges.
1701. Earl of Jersey.
1704. Earl of Shrewsbury.
1706. Earl of Sunderland.

1845. Earl Grey.
MINK, a name for certain large species of the zoological genus *M. Putorius* (Polecat), distinguished by slight structural modifications and semi-aquatic habits. The two best-known species, so much alike in size, form, colour and habits that, although they are widely separated geographically, some zoologists question their specific distinction, are *M. lutreola, the Nors or Sumpfleeter (marsh-otter) of eastern Europe, and M. vison, the mink of North America. The former inhabits Finland, Poland, and the greater part of Russia, though not found east of the Ural Mountains. Formerly it extended westward into central Germany, but it is now very rare, if not extinct, in that country. The latter is found in places which suit its habits throughout the whole of North America. Another form, *M. sibiricus*, from eastern Asia, of which much less is known, appears to connect the true minks with the polecats.

The name may have originated in the Swedish *maenke* applied to the European animal. Captain John Smith, in his *History of Virginia* (1626), at p. 27 speaks of "Martins, Polecats, Weesels and Minkes," showing that the animal must at that time have been distinguished by a vernacular appellation from its congener. By later authors, as Lawson (1709) and Pennant (1784), it is often written "Mink." For the following description, chiefly taken from the American form (though almost equally applicable to that of Europe) we are mainly indebted to Dr Elliot Coues's *Fur-bearing Animals of North America, 1877*.

In size it much resembles the English polecat—the length of the head and body being usually from 15 to 18 in., that of the tail to the end of the hair about 9 in. The female is considerably smaller than the male. The tail is bushy, but tapering at the end. The ears are small, low, rounded, and scarcely project beyond the adjacent fur. The pelage consists of a dense, soft, matted under fur, mixed with long, stiff, lustrous hairs on all parts of the body and tail. The gloss is greatest on the upper parts; on the tail the bristly hairs predominate. Northern specimens have the finest and most glistening pelage; in those from southern regions there is less difference between the under and over fur, and the whole pelage is coarser and harsher. In colour different specimens present a considerable range of variation, but the animal is ordinarily of a rich dark brown, scarcely or not paler below than on the general upper parts; but the back
is usually the darkest, and the tail is nearly black. The under jaw, from the chin out as far back as the angle of the mouth, is generally white. In the European mink the upper lip is also white, but, as this occasionally occurs in American specimens, it fails as an absolutely distinguishing character. Besides the white on the chin, there are often other irregular white patches on the under parts of the body. In very rare instances the tail is tipped with white. The fur is important in commerce.

The principal characteristic of the mink in comparison with its congeners is its amphibious mode of life. It is to the water what the other weasels are to the land, or martens to the trees, being as essentially aquatic in its habits as the otter, beaver, or musk-rat, and spending perhaps more of its time in the water than it does on land. It swims with most of the body submerged, and dives with perfect ease, remaining long without coming to the surface to breathe. It makes its nest in burrows in the banks of streams, breeding once a year about the month of April, and producing five or six young at a birth. Its food consists of frogs, fish, fresh-water molluscs and crustaceans, as well as mice, rats, muskrats, rabbits and small birds. In common with the other animals of the genus, it has a very peculiar and disagreeable effluvium, which, according to Dr Couses, is more powerful, penetrating and lasting than that of any animal of the country except the skunk.

MINNEAPOLIS, the largest city of Minnesota, U.S.A., and the county-seat of Hennepin county, situated on both banks of the Mississippi river at the Falls of St Anthony and immediately above St Paul. Pop. (1870), 13,666; (1880), 46,887; (1890), 104,738; (1900), 202,718; (1910 census) 301,408. Of the total population in 1900, those of foreign parentage (both parents foreign-born) numbered 118,946, and there were 61,021 of foreign birth, including 20,035 Swedes, 11,532 Norwegians, 7335 Germans, 5637 English Canadians, 3213 Irish, 2290 English, 1929 Russians, 1706 French Canadians and 1133 Austrians. Minneapolis is served by the Chicago, Burlington & Quincy, the Chicago, Great Western, the Chicago, Milwaukee & St Paul, the Chicago & Northwestern, the Chicago, Rock Island & Pacific, the Great Northern, the Minneapolis & St Louis, the Minneapolis, St Paul & Sault Ste Marie, and the Northern Pacific railways. It has also three terminal switching lines and the belt line of the Minnesota Transfer Company, serving both Minneapolis and St Paul.

With St Paul, which is served by the same system of railways, Minneapolis is the chief railway centre of the Northwest and one of the greatest in the United States, being the principal gateway to the commerce of the Canadian and Pacific northwest. There are a Union passenger station, and separate stations for the Chicago, Milwaukee & St Paul, the Chicago, Great Western and the Minneapolis & St Louis railways.

The city is situated on a high plateau (800-850 ft. above sea-level) above the river, and covers an area of about 53 sq. m. It has an extensive system of boulevards, parks and parks (aggregating 2465 acres in 1908). Among the parks are Loring, near the centre of the city, in which is a statue of Ole Bull; Loring Park, the most prominent; Van Cleve, a park lying north-west of Lyndale; Glenwood, in the west of the city; Van Cleve, Logan, Windom and Columbia in the part of the city east of the Mississippi river; Riverside, on the south-west bank of the Mississippi; and Minnehaha Park, in which are the Minnehaha Falls, a beautiful cascade of the Minnehaha Creek (the outlet of Lake Minnetonka), near Minneapolis, with a fall of 50 ft., well known from Longfellow's poem "Hiawatha.

The numerous small lakes in the city (there are about 200 lakes in Hennepin county) have been incorporated in the park system; among them are Lake Harriet (333 acres; in Lake Harriet Park), Lake Calhoun (on which are extensive public baths), Lake Amelia (295 acres), Lake of the Isles (100 acres), Cedar Lake, Powder Horn Lake (in the park of that name) and Sandy Lake (in Columbia Park). Adjoining Minnehaha Park are the grounds (51 acres, given to the state by the city) and buildings of the Minnesota state soldiers' home (1897); and 2 m. beyond the Falls, at the junction of the Minnesota and Mississippi rivers, is the Fort Snelling Military Reservation (1819). Seven miles south-west of the limits of the city is Lake Minnetonka, one of the most famous summer resorts in the Northwest, a beautiful body of water 15 m. long, with a shore line of 150 m. encircled by undulating wooded hills. Among the most fashionable streets are Mount Curve, Clifton and Park avenues, all in the "West Division" or south-western quarter of the city. The streets in all parts of the city are of exceptional width and heavily shaded in the residential districts. There are handsome residential suburbs.

The court-house and city-hall, constructed of red Minnesota granite and completed in 1902 at a cost of about $3,500,000, is one of the finest municipal buildings in America. Other prominent buildings are the Masonic Temple, the Chamber of Commerce, the Lumber Exchange, the Bank of Commerce, the Auditorium; the buildings of the Metropolitan Life (formerly the Guaranty), the Security Bank, the Northwestern National Bank, the First National Bank, the Andrus, the New York Life, and the Young Men's Christian Association; Hotel Radisson and West Hotel. Minneapolis is the see of a Protestant Episcopal bishopric. On the east side of the river are the buildings of the university of Minnesota (p.v.). In Minneapolis are the Minneapolis College of Physicians and Surgeons (1884), the medical school of Hamline University; Augsburg Seminary (Norwegian Lutheran, 1869), the United Church Seminary (1894), the Minnesota College (Swedish, 1905), the Minneapolis Normal School for Kindergartners, the Froebelian Kindergarten Normal School, Graham Hall and Stanley Hall, the Minneapolis School of Music, Oratorio and Dramatic Art, and the Northwestern Conservatory of Music. Between Minneapolis and St Paul are the main buildings of Hamline University (Methodist Episcopal, co-educational, 1854). The public library (more than 180,000 volumes in 1908) grew out of a private library, the Athenaeum (1860), was reorganized by Herbert Putnam (librarian from 1887 to 1892), and has several branches, the most notable of which is the Pillsbury Library (1904) on the east side; in its main building (Hennepin Avenue and 15th Street) are the offices of the Minnesota Academy of Arts and Sciences (1873), which, with the Society of Fine Arts, assisted in erecting the building in 1884. Among the hospitals and charitable institutions are the Minneapolis city hospital, the state hospital for crippled and deformed children, and Asbury Methodist, the Northwestern, the Deaconess, the Swedish, the St Mary's, the Maternity and the St Barnabas hospitals, Bethany Home, the Catholic orphan asylum, the Washburn orphans' home, the Pillsbury House (1906) where settlement work is carried on by the Plymouth Congregational Church, and several free dispensaries. The first newspaper in the city was the St Anthony Express, which began publication in 1851; it is no longer in existence. In 1906 the city had, in addition to numerous weekly and monthly periodicals (English, Norwegian-Danish, Swedish, German, French), four dailies, the Tribune (1867), the Journal (1878), and the News (1905), all in English, and the Tidend (Norwegian-Danish), established as a weekly in 1851.

The Mississippi river, which here has an average width of about 1200 ft., is crossed by 17 bridges (7 highway and 8 railway bridges). The Federal government undertook to deepen the channel by dredging and by making two dams and two locks between the Chicago, St Paul, Minneapolis & Omaha railway bridge in St Paul and the Washington Avenue bridge in Minneapolis—a distance of 11.4 m.—from 2 or 3 ft. to 6 ft., and to make the river regularly navigable as far as the Washington Avenue bridge, Minneapolis; the project, first adopted in 1894 and modified in 1907, was 70% completed in July 1908, and up to that time $1,061,397 had been spent on the work. The enormous water-power of the Falls of St Anthony, yielding about 40,000 h.p., has been the principal factor in making Minneapolis a great manufacturing centre. The rapid erosion of the soft limestone bed at one time threatened the destruction of the power, but this has been prevented by an enormous apron and an artificial concrete floor (completed in 1876). Additional water-power (25,000 h.p.) is derived from Taylor's Falls on the St Croix
MINNESINGERS 547

The proximity of the rich wheatfields of the north-west, and the extensive timber forests, have made Minneapolis the greatest lumber and flour centre in the world. The importance of the flour manufacturing industry was originally due to the excellent water-power available, and dates from the introduction of improved roller-mill methods in the early 'seventies, although there were successful mills in operation twenty years earlier. The enormous flour-mills of Minneapolis (22 in 1907) are perhaps the most interesting sights of the city. Their aggregate daily capacity is over 80,000 barrels, the largest of them having a capacity of 15,000 to 16,500 daily. In 1905 the value of the city's flour and grit mill products was $26,754,446, 51.6 % of the total value of the city's factory product, and 8.8 % of the value of the flour and grit mill products of the entire United States. Food preparations were valued in 1905 at $1,361,452. Minneapolis is also the greatest primary wheat market in the world, its 40 or more elevators (of which those of the Washburn-Crosby Company, erected in 1907, are the largest) having a net capacity of about 35,000,000 bushels, and handling more than 90,000,000 bushels in 1908. Its commerce in other grains is also extensive; in the amount of barley received and shipped Minneapolis surpasses any other city in the United States, in receipts and shipments of rye is second only to Chicago. The Mississippi river above Minneapolis is made to serve, by means of a series of extensive log-booms, as the principal source of supply to the great saw-mills, of which there are some of the largest in the world, with a combined capacity of 3,500,000 ft. a day, and with an average annual cut of 575,000,000 ft. The total value of the lumber products in 1905 was $8,966,842 (lumber and timber, $5,816,726; planing-mill products, including saws, doors and blinds, $4,144,116). Other important manufactures with the product-value of each in 1905 were malt liquors ($1,185,528), foundry and machine shop products ($5,820,675), structural iron-work ($1,901,771), steam railway car construction and repairing ($2,027,248), patent medicines ($1,715,889), furniture ($1,238,314), cooperage ($1,415,560), and hosiery and knit goods ($575,455). The total value of the factory product was $94,407,774 in 1900, and $121,503,120 in 1905, an increase of 28.8 %; in 1905 the value of the factory product was 39.5 % of that of the entire state.

Minneapolis is governed under a charter adopted in 1872 (when St Anthony and Minneapolis were consolidated) and frequently amended. It provides for the election of a mayor, treasurer and comptroller for two-years terms; for elected boards of control for library, parks and education, and for a unicameral city council, half of which is chosen every two years for a term of four years. The mayor, whose veto may be nullified by an adverse vote of two-thirds of the council, has very limited appointing powers, the head of the police department being the most important of his appointees. The city council elects the city clerk, city attorney, city engineer, chief of the fire department and most of the minor officers. Under a provision of the charter adopted in 1887 saloons are not permitted outside the "patrol limits of the business district", so that there are no saloons in the residential districts of the city. The municipality owns the waterworks system, the water supply being obtained from the Mississippi river.

History.—The first recorded visit of a European to the site of Minneapolis was that of Father Louis Hennepin, the French Jesuit missionary, who discovered and named the Falls of St Anthony in 1680; but it is almost certain that he was preceded by some of the adventurous coureurs des bois, few of whom left record of their wanderings, and Radisson and Greeliers seem to have visited this region two decades before Hennepin. The land on which the city lies, being divided by the Mississippi river, was for many years under different sovereignties, the east side becoming United States territory at the close of the War of Independence, while the west side, after being under Spanish and French rule, did not become a part of the United States until the purchase of Louisiana in 1803. In 1766 the site was visited by the American traveller, Jonathan Carver, and in 1805 by Lieut. Zebulon M. Pike; the military reserve which Pike bought from the Indians included a greater portion of the west side of the present city. After the erection of Fort St Anthony (1819; later called Fort Snelling), a water-power saw-mill was erected (1822) to saw lumber for the fort on the east bank of the river at the Falls of St Anthony. Later flour was also ground in this mill, which thus became the forerunner of the greatest of the city's industries. Gradually as the Indian land titles became extinguished the east bank was settled. The first settlement on the west bank was made by Colonel John H. Stevens in 1850, but the land was not opened to settlers until 1855. The village of St Anthony, on the east side of the river, was incorporated in 1855; Minneapolis, on the west bank, was incorporated in 1856. St Anthony became a city in 1860, and Minneapolis, which then had only 2954 inhabitants, soon outstripped its neighbour after the Civil War, and received a city charter in 1867. In 1870 Minneapolis alone had 13,666 inhabitants (18,099 with St Anthony), and in 1874 the two cities were united under the name of Minneapolis. The Republican National Convention met in Minneapolis in 1884 and nominated President Benjamin Harrison.

MINNESINGERS (Ger. Minnesinger from Minne, love), the name given to the German lyric poets of the 12th and 13th centuries. The term Minnesang, strictly applicable to the poems expressing the homage (Minnedienst) rendered by the knight to his mistress, is applied to the whole body of lyric poetry of the period, whether dealt with love, religion, or politics. The idea of amour courtis, with its excessive worship of woman, its minute etiquette and its artificial sentiment, was introduced into German poetry from Provencal literature; but the German Minnesang was no such slavish imitation of the poetry of the troubadours. Its tone was, on the whole, far healthier and more sincere, reflecting the difference between the simple conditions of German life and the older and corrupt civilization of Provence. The minnesinger usually belonged to the lower ranks of the nobility, and his verses were addressed to a married woman, often above him in rank; consequently the commonest lyric themes are the lover's hopeless devotion and complaints of the lady's cruelty, expressed with a somewhat wearisome iteration. That real passion was sometimes present may be safely assumed, but it was not within the rules of the game, which corresponded fairly closely to the later sonneteering conventions. The poet was not permitted to give the lady's name, or to betray her identity; and a direct expression of passion would also have contravened the rules. The poems were from the first sung in open court to a melody (Weise) of the poet's own composing, with the accompaniment of a fiddle or small harp. That the minnesinger was no improvisor is evident from the complicated forms of his verse, which were partly borrowed from the Provencal, but possibly owed something to the Latin rhymed verse 1 of the wandering scholars. The older songs consisted of a single strophe cast in three divisions, two (known as Stollen or doorposts) identical in form, stating and developing the argument, the third (Abgesang) of different form, giving the conclusion. Later on, two or more strophes were used in a single poem, but the principle of their structure was retained. In this they resembled the Taedel, a dialogue describing the parting of lovers at dawn; and the crucifying son. In one of these existed the Spruch, written in a single undivided stanza, destined for recitation and often cast in the form of a fable. The lay (Leich) was written in unequal strophes, each formed of two equal divisions. It was applied in the first instance to sacred lyrics, 1 See the Carmina Burana, ed. J. A. Schmeller, 4th ed., Breslau, 1904.
and was first used in love poems by the Alsatian minnesinger Ulrich von Vogenburg.

The origin of the native lyric, which flourished especially in Austria and Bavaria, is perhaps to be sought in the songs which accompanied dancing. These were not necessarily love songs, but celebrated the coming of spring, the gloom of winter &c., the commonplaces of Minnesang throughout the two centuries of its existence. The older lyrics, which date from the middle of the 12th century, are simple in form and written in the ordinary epic metre. The earliest minnesinger whose name has come down to us is Der von Kürenberg (fl. c. 1160), a scion of an Austrian knightly family whose castle lay on the Danube, west of Linz. These songs, however, contradict the root idea of Minnendienst, since the lady is the wooer, and the poet, at the most, an acquisitive lover. They take the form of laments for an absent lover, complaints of his faithlessness and the like. Among the other Austrian and south German lyrists who show small trace of foreign influence was Dietmar von Aist (d. c. 1171), though some of the songs attributed to him seem to be of later date. While the love-song remained in the hands of noble singers, the Spruch was cultivated by burgher poets. The elder of the two or three poets concealed under the name of Spervogel was a wandering singer who found patronage at the court of the burgraves of Regensburg, one of whom himself figures among the earlier minnesingers.

The characteristic period of German Minnesang begins at the close of the 12th century with the establishment of the Provençal tradition in western Germany through the poems of Heinrich von Veldeke and Friedrich von Hausen. National elements abound in Veldeke’s songs, although the amour courtois dominates the whole; Friedrich von Hausen (d. 1190) followed Provençal models closely. The long crusading song Sie darf mich des Zitzen nicht, is a good example of his powers. A close disciple of the troubadours Peire Vidal and Folquet de Marseille was the Swiss Count Rudolf von Fenis.1 The greatest name among the earlier minnesingers is that of Heinrich von Morungen, a Thuringian poet who lived in popular story in the ballad of “The Noble Miskier.” He brought great imaginative power to bear on the common subjects of Minnesang, and his poetry has a very modern note. The formal art and science of Minnesang reached full development in the subtle love-songs of Reimann, the Alsatian “nightingale of Hagenau.” Uhland aptly called him the “scholastic philosopher of unhappy love.” As a metrist he developed a greater correctness of rhyme, and a better handling of German metre. He became a member of the court of Duke Leopold V. (d. 1194) of Austria, and there Walther von der Vogelweide (q.v.) was first his disciple, and then perhaps his rival. Walther, the greatest of medieval German lyric poets, had Reimann’s technical art, but in feeling was more nearly allied to Morungen. He raised the Spruch to the dignity of a serious political poem, which proved a potent weapon against the policy of Innocent III. In 1202 at the court of Hermann, landgrave of Thuringia, he met Wolfram von Eschenbach, who is said to have taken part in the tourney of poets known as the Warburgsieg, made world-famous through Wagner’s operas. Walther’s Spruch gave him a high place in Minnesang, although his fame, like that of Heinrich von Veldeke and Hartmann von Aue, chiefly rests on his epics. A new style—called by Lachmann höfische Dorfpoesie—was marked out by Neidhart von Reuenthal (d. c. 1240), who belonged to the lesser Bavarian nobility. He wrote songs to accompany the dances of the village beauties, and comic and realistic descriptions of village life to please the court. He was acknowledged by the Meistersinger as one of the twelve masters of song. Nevertheless, with him the decadence may be said to have begun.

The Styrían poet Ulrich von Lichtenstein (d. c. 1275) unconsciously caricatured chivalry itself by his Frauenlied, in which he relates the absurd feats which he had undertaken at his lady’s command, while Steinhart (fl. 1270) deliberately parodied

1 Rudolf II, count of Neuenburg (d. 1190), or, according to some, a nephew of his who died in 1237.

court poetry in his praises of rustic beauty and good living. In the lays, songs and proverbs of Tannhäuser something of both elements, of the court and the village, is to be found. He seems to have lived as a wandering singer until 1268, and there very soon grew up round his name the Tannhäuser myth which has so little foundation in his life or poetry. The Austrian poet Reimann von Zweter (d. c. 1260) left some hundreds of Sprüche political or social in their import. Among the princes who practised Minnesang were the emperor Henry VI., though the two songs preserved under his name are of doubtful authenticity, Duke Henry IV. of Breslau (fl. 1270-1290), King Wenceslaus II. of Bohemia, the margrave Otto IV. of Brandenburg, Wizlaw IV., prince of Rügen and the unhappy Conradin, the last of the house of Hohenstaufen, beheaded by the order of Charles of Anjou before he reached his seventeenth year.

The didactic motive came more and more to the front in the 13th century. The wandering Swabian poet Marner (d. c. 1270) cultivated especially the Spruch, laughed at the Provençal and courtly tradition, and there is very no great step from his learning to his feeds to the conditions of Meistersang. Heinrich von Meistersang (13th cent.) “ladies’ praise”, was one of the last minnesingers, and his pedantry and virtuosity entitle him to be called the first meistersinger.

BIBLIOGRAPHY.—The chief MSS. containing the work of the 900 or more minnesingers whose work has been partially preserved, are the old Heidelberg MS. (13th century), the Wiengarten—Stuttgart MS. (14th century) and the Great Heidelberg MS. (14th century), both in the possession of the Hofbibliothek as the German-American Roman Catholic Bishop of Charleston (of Virginia). The songs of Heinrich von Morungen, those of Walther von der Vogelweide; there is a comprehensive selection of 97 minnesingers by Karl Bartsch, Deutsche Liederdichter des zwölfen bis vierzehnten Jahrhunderts (ed. W. Goltz, Berlin 1901) with bio-bibliographical account of individual minnesingers; see also F. Pfaff, Der Minnesang der 12 bis 14 Jahrhunderte, pt. 1. (Stuttgart, 1892). English translations of early German lyrics are F. C. Nicholson, Old German Love Songs, transcribed from the minnesingers of the 12th to 14th centuries (London, 1907). See also Walther v. d. Vogelweide.

Falke, Die ritterliche Gesellschaft im Zeitalter der Frauenritter (Berlin, no date).

MINNESING, a North Central State of the United States of America. It is bounded on the S. by Iowa, on the W. by South and North Dakota—the Red River (commonly called the Red River of the North)—on the E. by the Canadian province of Manitoba and Ontario, being separated from the latter by the Lake of the Woods, Rainy River and Rainy Lake, and certain of their tributaries and outlets, and on the E. by Lake Superior and by Wisconsin, from which it is separated for the greater part of the distance by the Mississippi and St. Croix Rivers. It is the tenth state in size in the Union, with a total area of 84,682 sq. m., of which 3824 sq. m. are water surface.1 From north to south it is about 400 m. in length, extending from 43° 30’ to 49° 23’ 55” N. lat., and from east to west its width is about 354 m., lying between long. 89° 26’ and 97° 15’ W.

The north-east part of the state is included in the Great Lakes Province, and the southern and western parts are in the Prairie Plains Province. The whole area of the state was formerly a complexly folded mountainous region of strong relief, which was

1 In addition the state contains approximately 2514 sq. m. of Lake Superior.
MINNESOTA

549

afterwards worn down to a more nearly level surface, except in the extreme north-east corner, where ridges of harder rock resisted erosion. Marine deposits were laid down over the south of the state after a submergence of the region; an uplift afterwards made of these deposits a coastal plain. The rather level surface of the "worn down mountains" of the north of the state and the coastal plain beds of the southern and western parts are now dissected by rivers, which make most of the state a rolling or hilly country, without strong relief. The average elevation is about 1275 ft. above sea-level or 600 ft. above the surface of Lake Superior. An extensive water-parting in the north central part of the state, an elevation whose inclination is almost imperceptible, determines the course of three great continental river systems. From this central elevation the land slopes off in all directions, rising again in the extreme north-east corner, where the rugged granite uplift in Cook county, known as the Misquah Hills, reaches an altitude of 2230 ft., the highest point in the state; and in the south-west corner, where an altitude of 1800 ft. is reached in the Coteau des Prairies. Only in the valleys of the Red, Minnesota and Mississippi rivers does the elevation fall below 820 ft. In the southern and central portions of the state, open rolling prairies interspersed with groves and belts of oak and other deciduous hard-wood timber predominate. A little north of the centre the state is traversed from north-west to south-east by the extensive forest known as the "Big Woods," in which also oak occurs most frequently. In the northern part of the state the great pine belt stretches from the head of Lake Superior westward to the confines of the Red River valley, while along the north border and in the north-east the forest growth is almost exclusively tamarack and dwarf pine. More than three-fourths of the area of the state is arable, the small percentage of non-arable land lying principally in the north-eastern regions, which afford compensation in the form of rich mineral deposits. Of the three great continental river systems above mentioned, the Red River and its tributaries drain the western and westernmost central slope northward through Lake Winnie into Hudson Bay; the other two being the St Lawrence system, to which the St Louis River and its branches and several smaller streams flowing into Lake Superior contribute their waters by way of the Great Lakes and the Mississippi, which with its tributaries drains about two-thirds of the state into the Gulf of Mexico. A few rivers in the south drain into the Mississippi through Iowa, while a smaller area in the extreme north is drained through the Lake of the Woods and Rainy Lake into Hudson Bay. These river systems serve the threefold purpose of drainage, providing water communications (there being about 3000 m. of navigable waters in the state), and, by falls and rapids caused by glacial displacement of rivers, furnishing a magnificent volume of water-power. The Mississippi river, which flows for about 650 m. within or along the borders of the state, has its principal sources in and near Lake Itasca. It affords facilities for the transport of logwood from the forests of booms above Minneapolis, and is navigable below St Paul; being half a mile broad where it reaches the border of the state at Hastings. At the Falls of St Anthony, St Croix, Little Falls and other places, it provides ample water-power for manufacturing purposes. Its two principal tributaries are the St Croix and the Minnesota. The first, after having for about 135 m. (about 50 being navigable) formed the boundary between Wisconsin and Minnesota, enters the Mississippi at Hastings; the second, rising in Big Stone Lake on the western border, but 1 m. from Lake Traverse, the source of the Red River, enters the Mississippi from the south-west between St Paul and Minneapolis after a course of about 450 m., about 240 of which are navigable at high water. Both furnish valuable water-power, which is true also of the Cannon and Zumbro rivers flowing into the Mississippi below Hastings. The Red River, which forms the western boundary of the state for more than 500 miles in distance, has its source in Lake Traverse. Its most important branch is the Red Lake River, and both are navigable for vessels of light draught at high water. In the south the western fork of the Des Moines River, flowing for 125 m. through the state, is navigable for 20 m. Glacial action determined the direction and character of the rivers, made numerous swamps, and, by scouring out rock basins, damming rivers and leaving morainal hollows, determined the character and formation of the lakes, of which Minnesota has upwards of 10,000, a number probably exceeding that of any other state in the Union. The general characteristics of the lakes in the north differ from those of the south, the former being generally deep, with rugged rocky shores formed by glacial scouring which caused rock basins, the latter being mostly shallow. The most interesting feature of the glacial epoch is the extinct Lake Agassiz, which the receding ice of the later glacial period left in the Red River valley of Minnesota, North Dakota and Manitoba. This lake drained southward into the Gulf of Mexico via the Minnesota and Mississippi rivers, until the ice sheet which had prevented its natural drainage to the north had melted sufficiently to allow it to be drained off into Hudson Bay by way of the Nelson River. The remarkably level character of the Red River district is due to horizontal displacement of the soil to the westward of the lakes, which was disected by river erosion. The largest of the present lakes, Red Lake, in Beltrami county, has an area of 342 sq. m. Other large lakes are Mille Lacs (198 sq. m.), in Mille Lacs and Aitkin counties; Leech Lake (184 sq. m.) in Cass county; Lake Winnibigoshish (82 sq. m.) in Itasca county; and Vermilion Lake (66 sq. m.) in St Louis county. On the northern boundary are the Lake of the Woods (612 sq. m.) and Rainy Lake (148 sq. m.), draining northwards into Hudson Bay. The beautiful "Park Region," centring in Ottertail county, contains several thousand lakes. Several large lakes such as Pepin, Traverse and Big Stone are river expansions. The state supports three parks—Itasca state park (22,000 acres, established in 1891), about the sources of the Mississippi, in Clearwater, Becker and Hubbard counties; the St Croix (established in 1893), in Chicago county, across the St Croix from the Wisconsin state park of the same name, and including the beautiful Dalles of the St Croix; and the Minnesota state park (established in 1905), containing Minnesota Falls, near Mankato.

Flora and Fauna.—The flora and fauna are similar to those of the other states of the same latitude. The rapid settling of the state drove its native fauna, which comprised buffalo, deer, moose, bear, lynx and wolves, in great numbers into the northern sections, westward into Dakota, or across the Canadian border. Deer and moose are still numerous in the state. The wild life is to a great extent protected by stringent game laws, administered by an efficient State Game and Fish Commission. The fisheries, which are of great value, are carefully supervised and systematically replenished from the State Fish Hatcheries. There are three hatcheries at St Paul, at Minneapolis, and at Duluth, in which particular attention is devoted to the fish of Lake Superior. Minnesota ranked third among the states of the Union in 1900 in the production of lumber, but in 1905 was fifth, the supply having diminished and the industry having been developed in the states of Washington and Louisiana. The danger of loss from forest fires, such as that of 1904, emphasized the necessity of forest preservation, and resulted (1895) in the creation of a special state department of forests, to enforce upon corporations and individuals a strict observance of the forestry laws, the good effects of the law being evidenced by the fact that the fire losses in forest lands for the first twelve years of the existence of the law averaged $2000 per annum, in order to encourage the growth and preservation of the forests, and to create systematically forest reserves, the legislature established in 1899 a State Forestry Board. There are two national forest reserves, with an aggregate area of 125,385 acres.

Climate.—Minnesota has the characteristic climate of the North Central group of states, with a low mean annual temperature, a notably rarefied atmosphere that results in an almost complete absence of damp foggy weather, and an unusual dryness which during the rather long winters considerably neutralizes the excessive cold. The cold increases not only from south to north, but to some extent from east to west. The mean annual temperature, according to the reading of the Weather Bureau, is -10° F. at St Paul and points in the north-east and as far south-west as Moorhead, Clay county. In the south the season is usually without killing frost in May, and the last killing frost is generally in late July. Unusually early frosts are uncommon in late May or early in September. The amount of rain decreases from east to west, the mean annual rainfall being 32.7 in. at Grand Meadow in the south-east and 33.3 in. at Mount Iron in the north-west, but less than 25 in. at several points of observation in the western half of the state. In all sections a large
much, or even more, rain falls in summer as in both autumn and winter, and the summer rains, together with the long summer days, are very favourable to a rapid growth and early maturity of crops. Nearly the whole state is usually covered with snow during the greater part of winter, and the half-yearly fall of snow is from about 52 in. at points in the north-east to less than 25 in. in the south-west. In most localities the prevailing winds are north-west in winter and southerly in summer, but at Duluth, on the shore of Lake Superior, the wind from the south-east is the prevailing winter wind.

Soil and Minerals.—The surface drifts of the greater part of the state, which are almost wholly of glacial origin, have provided the state with remarkable fertile soil. It consists largely of a dark brown or black clayey loam, derived from the drift, of which inorganic matter and mineral salts induces rapidity of growth, and the strength and durability of which render it capable of a long succession of crops. This soil prevails throughout the south-eastern and south-western parts of the state. On the north-western plains, which consist largely of drift, the black prairie or alkali is prevalent, and the northern part of the state is barren and swampy. The lakes and rivers have a Jake in their drainage; and the numerous lakes, including the Great Lakes, give the state a much greater water area than is found in any other state except Louisiana. The Great Lakes, however, were formed before the drift and the state, and the glaciers have since covered them with a deposit of fine loam.

The Great Lakes, with an area of nearly 100,000 square miles, and the lakes in their drainage, give the state a much greater water area than is found in any other state except Louisiana. The Great Lakes, however, were formed before the drift and the state, and the glaciers have since covered them with a deposit of fine loam. The Great Lakes provide a great deal of water for navigation, and are the chief source of the state's water supply.

Minerals.—The state is rich in mineral resources. The chief mineral products are iron ore, copper, lead, zinc, silver, gold, and coal. The iron ore deposits are located in the Mesabi Range, which extends for about 70 miles along the north shore of Lake Superior. The copper deposits are located in the Porcupine Range, which extends for about 15 miles along the north shore of Lake Superior. The lead and zinc deposits are located in the Chippewa Range, which extends for about 50 miles along the north shore of Lake Superior. The silver and gold deposits are located in the Mesabi Range and the Chippewa Range.

The state is also rich in coal, with deposits located in the north-eastern part of the state. The state is also rich in natural gas, with deposits located in the north-eastern part of the state. The state is also rich in oil, with deposits located in the north-eastern part of the state. The state is also rich in sulfur, with deposits located in the north-eastern part of the state. The state is also rich in salt, with deposits located in the north-eastern part of the state. The state is also rich in soda, with deposits located in the north-eastern part of the state. The state is also rich in potash, with deposits located in the north-eastern part of the state. The state is also rich in phosphate, with deposits located in the north-eastern part of the state. The state is also rich in fluorspar, with deposits located in the north-eastern part of the state. The state is also rich in mica, with deposits located in the north-eastern part of the state. The state is also rich in diatomite, with deposits located in the north-eastern part of the state. The state is also rich in pumice, with deposits located in the north-eastern part of the state.

only restriction is upon the range of subjects from which the student's choice may be made; a college of agriculture (including military tactics), which is now a "department," including a college and a school of agriculture, a short course for farmers, a dairy school, the Crookston school of agriculture, a main experiment station at St. Anthony Park, between Minneapolis and St. Paul, and sub-stations 1 m. north of Crookston and 2 m. east of Grand Rapids; a college of mechanic arts, now called the college of engineering and the mechanical arts, was founded in 1857 (fisheye, mechanical electrical and municipal engineering, a four-year course in science and technology, leading to the degree of Bachelor of Science, and graduate work leading to the degree of Master of Science; the college of law, a three-years course, with evening classes, a graduate course of study in the college of medicine and surgery (1888), and the college of homopathic medicine and surgery (1889), each with four-year courses, and each (since 1903) with a course of six years partly in the college of science, literature and art, and partly in the medical college and leading to the degrees of Bachelor of Science and Doctor of Medicine. In addition to these departments provided for in the organic act, the university included in 1900 colleges of dentistry (three-year course), pharmacy (two-year and three-year courses), a school of mines (1901; five-year course, leading to the degree of Engineer of Mines or Metallurgical Engineer), a school of analytical and applied chemistry (four-year courses, leading to the degree of Bachelor in Chemistry or in Chemical Engineering), a college of education (1906; three-year course, after two years of college work, leading to a Master's degree), a graduate school (with courses leading to the degrees of Master of Arts, of Science and of Laws, and of Doctor of Philosophy, of Science and of Letters), and partly in the medical college and leading to the degree of Bachelor of Medicine and Doctor of Medicine. In addition to these departments provided for in the organic act, the university included in 1900 colleges of dentistry (three-year course), pharmacy (two-year and three-year courses), a school of mines (1901; five-year course, after two years of college work, leading to a Master's degree), a graduate school (with courses leading to the degrees of Master of Arts, of Science and of Laws, and of Doctor of Philosophy, of Science and of Letters), and partly in the medical college and leading to the degree of Bachelor of Science and Doctor of Medicine. In addition to these departments provided for in the organic act, the university included in 1900 colleges of dentistry (three-year course), pharmacy (two-year and three-year courses), a school of mines (1901; five-year course, after two years of college work, leading to a Master's degree), a graduate school (with courses leading to the degrees of Master of Arts, of Science and of Laws, and of Doctor of Philosophy, of Science and of Letters), and partly in the medical college and leading to the degree of Bachelor of Medicine and Doctor of Medicine.

The university is one of the largest in the country. In 1907 there were twenty-three buildings valued at more than $1,475,000. The university library of 110,000 volumes is supplemented by the libraries of the University of Minnesota and St. Paul. In 1908-1909 the number of students was 4421. Higher educational institutions in Minnesota are Hamline University (Methodist Episcopal), with a college of liberal arts at St. Paul, and a theological seminary; the University of Minnesota (Methodist Episcopalian) at St. Paul; Augsburg Seminary (Lutheran) at Minneapolis; Carleton College (non-sectarian, founded in 1860) and St. Olaf College (Lutheran, founded in 1874) at Northfield; Gustavus Adolphus College (Lutheran) at St. Peter; Parker College (Presbyterian, founded in 1888) at Winnebago City; St. John's University (Roman Catholic) at Collegeville, Stearns county; and Albert Lea College for women (Presbyterian, founded in 1884) at Albert Lea.

History.—The first European visitors to the territory now embraced in the state of Minnesota found it divided between two powerful Indian tribes—the Ojibwa of the northern portion and the river along the Mississippi river, and the Sioux or Dakotas, who made their homes on the more open rolling country in the south and west and in the valley of the Minnesota. The first known white explorers were Radisson and Groseilliers, who spent the winter of 1658-1659 among the Sioux in the Mille Lacs region. At Sault Sainte Marie in 1671, before representatives of fourteen Indian nations, the Sieur de St. Louis read a proclamation asserting the French claim to all the territory in the region of the Great Lakes. Two years afterwards the upper course of the Mississippi was explored by Jollet and Marquette. In 1679 Daniel Greysolon, Sieur du Lhut (Duluth), as agent for a company of Canadian merchants which sought to establish trading posts on the Lakes, explored the country from the head of Lake Superior to Mille Lacs and planted the arms of Louis XIV. in a large Sioux village. In the following year the Franciscan friar Father Louis Hennepin, acting as an agent of the Sieur de la Salle, discovered and named the Falls of St. Anthony; and in the same year Father Charles de la Croix, Bishop of Quebec, afterwards Bishop of Lachine, explored the region of the Mississippi. In 1680 Father Antoine on the east bank of Lake Pepin, in what is now Pepin county, Wisconsin, and in 1688 formally took possession of the region in the name of the French king. A few years later (1694) Le Sueur, who had as early as 1684 engaged in trade along the upper Mississippi, established a trading post on Isle Pelée (Prairie Island) in the Mississippi between Hastings and Red Wing, and in 1700 he built Fort L'Huillier at the confluence of the Blue Earth and the Le Sueur rivers. In 1762 the Sieur de la Perrière, acting as an agent of the French government, established on the west bank of Lake Pepin a fortified post (Fort Beauharnois), which was to be a headquarters for missionaries, a trading post and a starting-point for expeditions in search of the "western sea." But none of the two posts proved permanent, and in 1763 French rule came to an end, the Treaty of November (1763) and the Treaty of Versailles (1763) transferring respectively the western portion of the state to Spain and that part east of the Mississippi river to Great Britain.

In 1766 the region was visited by the Connecticut traveller Jonathan Carver (1732-1780), Great Britain surrendered its title to the eastern portion by the Treaty of Paris (1783), and after the surrender of Virginia's colourable title had been accepted by Congress in 1784, this eastern part was made a part of the Northwest Territory by the ordinance of 1787, although the British held possession and did some trading there until 1796. The western part remained under Spanish control until 1803, when it, too, after being retransferred to France, became a part of the United States with the rest of the Louisiana Purchase.

In 1805-1806, at the instance of President Thomas Jefferson, Lieut. Zebulon M. Pike led an exploring expedition as far north as Lake of the Woods and took formal possession of the Minnesota region for the United States. He obtained from the Sioux for military reservations one tract 9 m. square at the mouth of the Minnesota river. In 1813, after the Battle of the River of the Wabasha, the state of Minnesota was divided into two districts on the confloence of the Minnesota and Mississippi rivers. One of these districts was to be a military post to be established by Lieut.-Colonel Henry Leavenworth (1783-1834) in 1819, and in the following year the construction was begun of a fort at first named Fort St Anthony but renamed Fort Snelling in 1824 (two years after its completion) in honour of its builder and commander Colonel Josiah Snelling (1782-1829). In 1819 Michigan Territory was extended westward to the Mississippi river, and in 1820 General Lewis Cass, its governor, conducted an exploring expedition in search of the source of the Mississippi, which he was satisfied was in the body of water named Lake Cass in his honour. Further search for the true source of the Mississippi was made in 1823 by Giacomo Constantino Beltrami (1779-1853), an Italian traveller and political refugee, and in 1832 by Henry Rowe Schoolcraft, who had accompanied Cass's expedition and traced the Mississippi from Lake Cass to Lake Itasca. In 1834 extensive explorations of the Minnesota and Red River valleys were conducted by Major Stephen Harriman Long (1784-1864), and subsequently (1834-1836) knowledge of the region was extended by the investigations of the mathematician and geologist Horace Capron, and the explorers William Featherstonhaugh (1780-1866), and the geologist Jean Nicholas Nicolle (1786-1843). Meanwhile, the country was slowly being settled. In 1823 the first river steamboat reached St Paul; the Mississippi was soon afterwards opened to continuous, if irregular navigation; and in 1826 a party of refugees from Lord Selkirk's colony on the Red River settled near Fort Snelling. On the erection of Wisconsin Territory in 1836 the whole of Minnesota, which then extended westward to the Missouri river, was incorporated with it, but on the erection of Iowa Territory in 1838 Minnesota was divided and the part west of the Mississipi became a part of Iowa Territory. In 1837, by important treaties, the one (July 29) between the Chippewas and Governor Henry Dodge of Wisconsin at St. Peters, and the other (Sept. 29) between some Sioux chiefs and Joel R. Poinsett at Washington, the Indian titles to all lands east of the Mississippi were practically extinguished. The first county, St Croix, was established in 1839, and in the succeeding years thriving settlements were established at St Paul and Stillwater. The admission of Wisconsin in 1848 was followed by the establishment of the new counties of St Croix and Lake, the west part of the St Croix and north of the Mississippi rivers, which was not included in the new state, practically without a government. On the 26th of August a convention met at Stillwater, where measures were taken for the formation of a separate territorial government, and Henry Hastings Sibley (1811-1891) was sent to Congress as a delegate of "Wisconsin Territory." Upon his admission to a seat the curious situation was presented of representatives of the state and of the territory of Wisconsin sitting in the same body. This situation did not last long, however, for on the 3rd of March, 1849 the bill organizing the territory of Minnesota was passed.
and on the 19th President Zachary Taylor appointed Alexander Ramsey of Pennsylvania the first territorial governor. The territorial boundaries extended to the Missouri river, including a greater part of the present North and South Dakota. The first territorial legislature met at St Paul on the 3rd of September following. By the Federal census of 1850 the territory had a population of 6077, most of whom lived east of the Mississippi, or along the Red river in the extreme north-west. Two treaties negotiated with the Sioux by Luke Lea, commissioner, and Governor Alexander Ramsey in 1851 opened up the greater part of the land within the territory west of the Missis- sippi, and such an unparalleled rush to the new lands took place that a census taken in 1857 showed a population of 150,037.

In July 1857 a convention chosen to form a state constitution was found on assembling to be so evenly divided between the Republican and Democratic parties that organization was impossible, and the members proceeded to their work in two separate bodies. By means of conference committees, however, identical constitutions were formed, which in the following October were adopted by an almost unanimous popular vote. The State was admitted to the Union with its present boundaries on the 12th of May 1858, and the federal census of 1860 showed that the population had increased to 72,023, despite the fact that the financial panic of 1857 had severely checked the state's growth.

Minnesota furnished more than 25,000 troops for the Federal armies during the Civil War. But even more pressing than the call of the nation was the need of defending her own homes against the uprisings of the Indians within her borders. The settlements bordering on the Indian reservations had experienced more or less trouble with the Sioux for several years, the most serious outbreak having occurred in March 1857, when Ink-pa-du-ta led his band to massacre the settlers at Spirit Lake. The absence of a large portion of the able-bodied young settlers in the northern armies was taken advantage of by the Indians, and in the summer of 1862 there was delay in paying them their yearly allowance. Suddenly towards the end of August, as if by previous understanding (although nothing of the sort was ever proved), small bands of Sioux scattered along the frontier for 200 m. and began a systematic massacre of the white settlers. Beginning with the first outbreak at Acton, Meeker county (Aug. 17), the attacks continued with increasing fury (nearly 1000 whites losing their lives) until the 23rd of September, when hastily-raised volunteer forces under Colonel H. H. Sibley decisively defeated Little Crow, the principal leader of the Kaposi band, at Wood Lake. Three days later more than 2000 of the Indians were surrounded and captured, Little Crow with a few of his companions alone escaping beyond the Missouri. A military commission tried 425 of the captives for murder and rape, of whom 321 were found guilty and 303 were condemned to death. Of these 38 were hanged at Mankato on the 26th of December 1862. Little Crow and his followers kept up desultory raids from the Dakota country, during one of which in July 1853 he lost his life. Expeditions of Sibley in 1863, and General Alfred Sully (1821–1879) in 1864, eventually drove the hostile Indians beyond the Missouri and terminated the war, which in two years had cost upwards of a thousand lives of settlers and volunteers. The opening of the Chippewa lands in the north-west and the coming of peace marked the beginning of a new period of rapid growth. The Federal census of 1870 shows a population of 439,760, or a gain of 75-8 % in five years. During the same half-decade railway construction, which had begun with the opening of the railway between St Paul and Minneapolis in 1862, reached a total of more than 1000 m. For a period of five years after the financial panic of 1873 the growth was comparatively slow, but in the succeeding two years the recuperation was rapid. During the decade, 1880–1890, more than 2300 m. of railway were completed and put in operation. In September 1894 disastrous forest fires, starting in the neighbourhood of Hinckley in Pine county, destroyed that village and several neighbouring towns, causing the death of 418 people, rendering 2200 others homeless, and devasting about 330 sq. m. of forest land, entailing a loss of more than $1,000,000. The state furnished four regiments (a total of 5313 officers and men) to the volunteer army during the Spanish-American War (1898), the service of the 1st Regiment for more than a year in the Philippines being particularly notable. In October 1898 there was an uprising of the Pillager band of Chippewa Indians at Leech Lake, which was quelled by the prompt action of Federal troops. Since the first state election, which was carried by the Democratic party, the state has been generally strongly Republican in politics; but the Republican candidate for governor was defeated in 1898 by a "fusion" of Democrats and Populists, and in 1904, 1906 and 1908 a Democratic governor, John Albert Johnson, was elected, very largely because of his personal popularity.

BIBLIOGRAPHY.—There is a well-arranged Bibliography of Minnesota by John Fletcher Williams in the Collections of the Minnesota Historical Society, vol. iii. (St Paul, 1889). Consult also Materials for the Future History of Minnesota, published by the State Historical Society (St Paul, 1892), and Isaac S. Bradley's History of the Northwestern institutions and the history of the Proceedings of the Wisconsin State Historical Society (Madison, Wis., 1896). Of the many interesting and valuable narratives and descriptions of Minnesota in the early days, those especially worthy of mention are Beltram's La Découvertes des sources Mississippi et de la Rivière Sanglante (New Orleans, 1824) and the same author's A Pilgrimage in Europe and America, leading to the Discovery of the Sources of the Mississippi and Mississippi River (London, 1828); H. Sibley's Narrative of an Expedition to the Sources of the St Peter (Minnesota) River, Lake Winnepiek, Lake of the Woods, &c. (in 2 vols., London, 1825), an account of the explorations of Major Long; Henry R. Schoolcraft's Minnesota (1851) and other works; William H. Emery's Records of an Expedition through the Upper Missis- sippi to Iasaka Lake... (in 2 vols., New York, 1834); G. W. Feather- stonehaugh, A Canoe Voyage up the Minnesota Sotar (2 vols., London, 1847); Laurence Oliphant, Minnesota and the Far West (Edinburgh, 1853); William Cushing, Life and Adventures of James G. Lake, one of the Emigrants of America (2 vols, New York, 1864). For the territorial period consult also E. S. Seymour, Sketches of Minnesota, The New England (the West) (1850); J. Wesley Bond, and Minnesota (New York, 1863); J. L. G. Drought, Minnesota and Dacotah (Washington, 1857); and C. E. Flandreau, The History of Minnesota and Tales of the Frontier (St Paul, 1901). The collections of the Minnesota State Historical Society contain much valuable material on the history of the state, notably D. Neill's Minnesota Voyages to Minnesota during the Seventeenth Century (1872); E. D. Neill's "Early French Forts" (1880); T. F. Moran's "How Minnesota became a State" (1898); H. L. Moss's "Last Days of the Territorial and Early Days of the Democratic Party" (1898); C. E. Flandreau's "Minnesota and the Indian War during the Terrestrial Period" (1901); C. D. Gillian's "Early Political History of Minne- sota" (1901); and James H. Baker's Lives of the Governors of Minnesota (1908). For the Sioux uprising consult Isaac V. Davis, History of the War with the Sioux Indians (New York, 1864); Charles S. Bryant and Abel B. Murch, A History of the Great Massacre by the Sioux Indians in Minnesota (Cincinnati, 1864); and S. R. Foot, "The Sioux Indian War," in Iowa Historical Record, vols. x. and xi. (1894-1895); Cowan, Minnesota in the Civil and Indian Wars, 1861-1865 (2 vols, St Paul, 1890-1893). The best general account of the state's history is W. W. Folwell's Minnesota, the North Star State (Boston, 1908), in the "American Commonwealth" series; E. D. Jenks, The City of Minnesota (Min- nesota, 1887); and T. H. Kirk's Illustrated History of Minnesota (St Paul, 1887) may also be consulted. For an account of the ad- ministration consult Frank L. McVey, The Government of Minnesota.
MINNOW—MINOS

MINNOW (Leuciscus phoxinus), the smallest British fish of the Cyprinid family, readily distinguished by its very minute scales. The ordinary name is derived from the common Indo-European word for "little" (cf. Lat., minor), and "minnow" is popularly identified with any tiny fish; in America it is given to small forms of the Gambusia and Notropis genera, &c. The British minnow abounds in lakes, rivers and brooks, swimming in schools, and shifting its ground in search of food, in the shape of every kind of animal and vegetable substance. It ranges from Scandinavia to south Europe, and from Ireland to north-east Asia, attaining an elevation of nearly 8000 ft. in the Alps. Its size varies from between 2 and 3 in. to as much as 4 or 5 in. The minnow is commonly used by anglers for bait, and is useful in ponds as food for trout, perch or pike.

MINO DI GIOVANNI (1431-1484), called DA FIESOLE, Italian sculptor, was born at Poppi in the Casentino. He had property at Fiesole. Vasari's account of him is very inaccurate. Mino was a friend and follower of Domenico del Signore, Matteo Civitali, and but three being about the same age. Mino's sculpture is remarkable for its finish and delicacy of details, as well as for its spirituality and strong devotional feeling. Of Mino's earlier works, the finest are in the duomo of Fiesole, the altarpiece and tomb of Bishop Salutati, executed before 1466. In the Badia of Florence are an altarpiece and the tombs of Bernardo Giugi (1466) and the Margrave Hugo (1481), all sculptured in white marble, with life-sized recumbent effigies and attendant angels. The pulpit in Prato Cathedral, in which he collaborated with Antonio Rossellino, finished in 1473, is very delicately sculptured with bas-reliefs of great minuteness, but somewhat weakly designed. Soon after the completion of this work Mino went to Rome, where he executed the tomb of Pope Paul II. (now in the crypt of St. Peter's), the tomb of Francesco Tornabuoni in S. Maria sopra Minerva, and a beautiful little marble tabernacle for the holy oils in S. Maria in Trastevere. There can be little doubt that he was also the sculptor of several monuments in S. Maria del Popolo, especially those of Bishop Gomiel and Archbishop Rocca (1492), and the marble reredos given by Pope Alexander VI. Some of Mino's portrait busts and profile bas-reliefs are preserved in the Bargello at Florence; they are full of life and expression, though without the extreme realism of Verrocchio and other sculptors of his time.

MINOR, ROBERT CRANELL (1839-1904), American artist, was born in New York city on the 30th of April 1839, and received his art training in Paris under Diaz, and in Antwerp under Joseph Van Luppen. His paintings are characteristic of the Barbizon school, and he was particularly happy in his sunset and twilight effects; but it was only within a few years of his death that he began to have a vague among collectors. In 1897 he was elected a member of the National Academy of Design, New York. After 1900 he lived at Waterford, Connecticut, where he died on the 4th of August 1904.

MINOR (Lat. for smaller, lesser), a word used both as an adjective and as a substantive for that which is less than or inferior to another, and often correlative opposed to that to which "major" is applied in the same construction. Among the numerous special uses of the word the following may be mentioned: "Minor Friars," sometimes known as "Minorites," i.e. the name (fratres minores, lesser brothers) given by St Francis to the order he founded (see Franciscans); "minor canons" are clergymen attached to a cathedral or collegiate church who read and sing the daily service. In some cathedrals they are known as "vicars choral"; they are not members of the chapter. (For the distinction between holy and minor orders in Christian hierarchy see Orders.) The name "Minor Prophets" is used collectively of the twelve prophetical books of the Old Testament from Hosea to Malachi inclusive. (For the distinction in music between major and minor intervals, and for other applications of the correlative term, see Music and Harmony.) In the categorical syllogism (q.v.), the minor term is that term which forms the subject of the conclusion, the minor premiss is that which contains the minor term. In law, a "minor" is a person under legal age (see Infant).

In mathematics, the "minor of a determinant" is the determinant formed by erasing an equal number of the rows and columns of the original determinant. If one column and row be erased there is formed the first minor; if two rows and columns the second minor, and so on. The minor axis of a central conic section is the shorter of the two principal axes; it may also be regarded as the line joining the two imaginary foci. In astronomy, the term minor planets is given to the members of the solar system which have their orbits between those of Mars and Jupiter (see Planets, Minor).

MINORCA (Menorca), the second in size of the group of Spanish islands in the Mediterranean Sea, known as the Balearic Islands (see Spain). Area, 1036 sq. m. (377,512 acres); altitude, 260 sq. m. The coast is deeply indented, especially on the north, with numerous coves and bays—that of Port Mahon (17,442) being one of the finest in the Mediterranean, if not the best of them all, according to the popular rhyme—

"Junio, Julio, Agosto y puerto Mahon
Los mejores puertos del Mediterraneo son—"

"June, July, August and Port Mahon are the best harbours of the Mediterranean" (see Port Mahon). The ports Addaya, Fornelle, Ciutadella and Nutia may also be mentioned. The surface of the island is uneven, flat in the south and rising irregularly towards the centre, where the mountain El Toro—probably so called from the Arabic Isr—that the natives have a legend of a Toro or bull—has an altitude of 1307 ft. The climate is not so equable as that of Majorca, and the island is exposed in autumn and winter to the violence of the north winds. Its soil is of very unequal quality; that of the higher districts being light, fine, and fertile, and producing regular harvests without much labour, while that of the plains is chalky, scanty, and unfit for pasture or the plough. Some of the valleys have a good alluvial soil; and where the hills have been terraced they are cultivated to the summit. The wheat and barley raised in the island are sometimes sufficient for home consumption; there is rarely a surplus. The Hedyysarum coronarium, or sula, as it is called by the Spaniards, is largely cultivated for fodder. Wine, oil, potatoes, hemp and flax are produced in moderate quantities; fruit of all kinds, including melons, pomegranates, figs and almonds, is abundant. The caper plant is common throughout the island, growing on ruined walls. Horned cattle, sheep and goats are reared, and small game abounds. Stone of various kinds is plentiful. In the district of Mercadal and in Mount Santa Agueda are found fine marbles and porphyries; lime and slate are also abundant. Lead, copper and iron might be worked were it not for the scarcity of fuel. There are manufactures of the wool, hemp and flax of the island; and formerly there was a good deal of boat-building; but agriculture is the chief industry. An excellent road, constructed in 1713-1715 by Brigadier-General Jacob Kane, to whose memory a monument was erected at the first milestone, runs through the island from south-east to north-west, and connects Port Mahon with Ciutadella. Ciutadella (8614), which was the capital of the island till Port Mahon was raised to that position by the English, still possesses considerable remains of its former importance.

MINOS, a semi-legendary king of Crete, son of Zeus and Europa. By his wife, Pasiphae, he was the father of Ariadne, Deucalion, Phaedra and others. He reigned over Crete and the islands of the Aegean three generations before the Trojan War. He lived at Cnossus for periods of nine years, at the end of which he retired into a sacred cave, where he received instruction from Zeus in the legislation which he gave to the island. He was the author of the Cretan constitution and the founder of its naval
MINOT—MINSK

555

supremacy (Herodotus iii. 122; Thucydides i. 4). In Attic tradition and on the Athenian stage Minos is a cruel tyrant, the heartless exactor of the tribute of Athenian youths to feed the Minotaur (q.v.). It seems possible that tribute children were actually exacted to take part in the gruesome shows of the Minoan bull-rings, of which we now have more than one illustration (see CRETE: Archaeology). To reconcile the contradictory aspects of his character, two kings of the name of Minos were assumed by later poets and mythologists. Since Phoenician intercourse was in later times supposed to have played an important part in the development of Crete, Minos is sometimes called a Phoenician. There is no doubt that there is a considerable historical element in the legend; recent discoveries in Crete (q.v.) prove the existence of a civilization such as the legends imply, and render it probable that not only Athens, but Mycenaean itself, was once subject to the kings of Cnossus, of whom Minos was greatest. In view of the splendid and wide influence of Minoan Crete, the age generally known as "Mycenaean" has been given the name of "Minyan" by Dr Arthur Evans as more properly descriptive (see CRETE). Minos, himself, was associated with the Cnossus of Sicily, whether he had gone in pursuit of Daedalus, who had taken Ariadne the clue by which she guided Theseus through the labyrinth. He was killed by the daughter of Cocalus, king of Agrigentum, who poured boiling water over him in the bath (Diod. Sic. iv. 79). Subsequently his remains were sent back to the Cretans, who placed them in a sarcophagus, on which was inscribed: "The tomb of Minos, the son of Zeus." The earlier legend knows Minos as a beneficent ruler, legislator, and suppessor of piracy (Thucydides i. 4). His constitution was said to have formed the basis of that of Lycurgus (Pausanias iii. 2, 4). In accordance with this, after his death he became judge of the shades in the under-world (Odyssey, ix. 568); later he was associated with Aeacus and Rhadamanthus.

The solar explanation of Minos as the sun-god has been thrown into the background by the recent discoveries. In any case a divine origin would naturally be claimed for him as a priest-king, and a divine atmosphere hangs about him. The name of his wife, Pasiphaë ("the all-shining"), is an epithet of the sun-goddess. The name Minos seems to be philosophically the equivalent of Minoan, and royal Minyas or Orchomenus, and his daughter Ariadne ("the exalted holy") is a double of the native nature-goddess.

(See CRETE: Archaeology.)

On Cretan coins Minos is represented as bearded, wearing a diadem, curly-haired, and dignified, like the traditional portraits of his reputed father, Zeus. On painted vases and sarcophagi he frequently occurs with Aeacus and Rhadamanthus as judges of the under-world and in connection with the Minotaur and Theseus.

MINOT, LAURENCE (fl. 1333-1352), English poet, the author of eleven battle-songs, first published by Joseph Ritson in 1795 as Poems on Interesting Events in the reign of King Edward III. They had been discovered by Thomas Tyrwhitt in a MS. (Cotton Galba, E. IX., British Museum) which bore on the flyleaf the misleading inscription: "Chaucer, Exemplar emendatur scriptum." It dates from the beginning of the 15th century. The authorship of Laurence Minot's eleven songs is fixed by the opening of the fifth: "Minot with mowth had menid to make," and in VII. 20: "Now Laurence Minot will begin." The poems were evidently written contemporaneously with the events they describe. The first celebrates the English triumph at Halidon Hill (1333), and the last the capture of Guines (1355). The writer is animated by an ardent personal admiration for Edward III. and a savage joy in the triumphs of the English over their enemies. The technical difficulty of his metres and the comparatively even quality of the work led to the inference that Minot had written other songs, but none have come to light. Nothing whatever is known of his life, but the minuteness of his information suggests that he accompanied Edward on some of his campaigns. Though his name proves him to have been of Norman birth, he writes vigorous and idiomatic English of the northern dialect with some admixture of midland forms. His poems are instinct with a fierce national feeling, which has been accepted as an index of the union of interests between the Norman and English elements arising out of common dangers and common successes.

There are excellent editions of Minot's poems by Wilhelm Scholle (Quellen und Forschungen, vol. ii., Strasburg, 1884), with notes on etymology and metre, and by Mr J. Hall (Clarendon Press, 2nd ed., 1897). Mr Hall is inclined to include as his work the "Hymn to Minot," and the "Minotaur and the Triple Boughs," Early English Text Society, No. 26, p. 76), on the grounds of similarity of style and language. See also T. Wright, Political Poems and Songs (Rolls series, 1859).

MINOTAUR (Gr. Μινώταυρος, from Minus, and ταύρος, bull), in Greek mythology, a fabulous Cretan monster with the body of a man and the head of a bull. It was supposed to be the offspring of Pasiphaë, the wife of Minos, and a snow-white bull, sent to Minos by Poseidon for sacrifice. Minos, instead of sacrificing it, spared its life, and Poseidon, as a punishment, inspired Pasiphaë with an unnatural passion for it. The monster which was born was shut up in the Labyrinth (q.v.). Now it happened that Androgeus, son of Minos, had been killed by the Athenians, who were jealous of the victories he had won at the Panathenaic festival. To avenge the death of his son, Minos demanded that seven Athenian youths and seven maidens should be sent every ninth year to be devoured by the Minotaur. When the third sacrifice came round Theseus volunteered to go, and with the help of Ariadne (q.v.) slew the Minotaur (Plutarch, Theseus, 15-19; Diod. Sic. i. 16, iv. 61; Apollodorus iii. 1, 15).

Some modern mythologists regard the Minotaur as a solar personification and a Greek adaptation of the Baal-Moloch of the Phoenicians. The slaying of the Minotaur by Theseus in that case indicates the abolition of such sacrifice by the advance of Greek civilization.

According to A. B. Cook, Minos and Minotaur are only different forms of the same personage, representing the sun-god Zeus of the Crete, who represented the sun as a bull. He and J. G. Frazer both explain Pasiphaë's monstrous union as a secret marriage (i.e. ζύμω ταῦρον), at which the queen of Cnossus was wedded to a bull-formed god, just as the wife of the βασιλεὺς Βασιλεὺς in Athens was wedded to Dionysus. E. Pottier, who does not dispute the historical personification of Minos, in view of the story of Phalaris (q.v.), considers it probable that in Crete (where a bull-cult may have existed by the side of that of the double axle) victims were tortured by being shut up in the belly of a red-hot brazen bull. The story of the Minotaur seems to be based on a legend of the dedication of a bull in the temple of Minos. Or, as others think, the Minotaur surrounded by a semicircle of small balls, probably intended for stars; it is to be noted that one of the monster's names was Asterius.

See A. Conze, Theseus and Minotauras (1878); L. Stephani, Der Kampf zwischen Theseus und Minotauras (1842), with plates and history of the legend; L. Preller, Griechische Mythologie; Hellwig in Roscher's Lexicon der Mythologie; F. Durrbach in Darmbergs Real-Encyclopädie der classischen Altertumswissenschaft; A. B. Cook in Classical Review, xvi. 410; J. G. Frazer, Early History of the Kingphill (1905); E. Pottier in La Revue de Paris (Feb. 1902); the story is told in Kingsley's Heroes.

MINSK, a government of western Russia, bounded by the governments of Vilna, Vitebsk, Mogilev and Chernigov on the N. and E. and by Kiev, Volhynia and Grodno on the S. and W. It has an area of 35,283 sq. m. The surface is undulating and hilly in the north-west, where a narrow plateau and a range of hills (800-1000 ft.) of tertiary formation separate the basin of the Svislach, which flows into the Baltic, from that of the Dnieper, which enters the Black Sea via the Dnieper Delta. The remainder of the government is flat, 450 to 650 ft. above sea-level, and covered with woods and clays of the glacial and post-glacial periods. It has two broad shallow depressions, drained by the Berezina and the Bdataset, cross the government from north to south and from west to east; and these, as well as the triangular space between them, are occupied by immense marshes (often as much as 200 to 600 sq. m. each), ponds and small lakes, peat-bogs and moving sands, intermingled with dense forests. This country, and especially its south-western part, is usually known under the name of Polesye ("The Woods"). Altogether, marshes and moors
take up 22% and marshy forests no less than 40% of the entire area of the province. It is only in the north-west that the forests consist of full-grown trees; those which grow on the marshy ground are small, stunted pine, birch and aspen. The climate of the Polesy is extremely unhealthy; malarial and an endemic disease of the hair (plica Polonica) are the plagues of these tracts. Communication is very difficult. The railway from Poland to Moscow has taken advantage of the plateau above mentioned; but it has to cross the broad marshy depression of the Berezina. A successful attempt was made to drain the marshes of the Polesy by a system of canals, and more than 4,500,000 acres have thus been rendered suitable for pasture and agriculture.

Two tributaries of the Dnieper—the Berezina and the Pripyet—both navigable, with numberless subtributaries, many also navigable, are the natural outlets for the marshes. The Dnieper flows along its south-eastern border for 160 m. and the Niemen on the north-western for 130 m. The affluents of the Baltic, the Dvina and the Vistula, are connected by canals with tributaries of the Dnieper. The estimated population in 1906 was 2,584,400. The peasants constitute 65% of the population, with about 16% mostly White Russians (71%), and are also Poles (13%), Jews (16%), Little Russians and Great Russians. About 70,000 are considered to be Lithuanians; there are also 4,500 Tatars and 2,000 Germans.

The principal occupation of the inhabitants is agriculture, which is very unproductive in the lowlands; in the Polesy the peasants rarely have pure bread to eat. Only 23.5% of the area is under crops, and 35.6% is used for pasturage. Hunting and bee-keeping are sources of income in the Polesy, and fishing gives occupation to about 20,000 persons. Gardening is carried on in some parts. The chief source of income for the inhabitants of the lowlands is the timber trade. Timber is floated down the rivers with and tallow, various products of bark, charcoal and timber-ware (wooden dishes, &c) are manufactured in the villages to a great extent; and ship-building is carried on along the Dnieper, Pripyet, and Niemen. Shipping is also an important source of income. The industrial arts are almost entirely undeveloped, but there are several distilleries, flour-mills, saw-mills and tanneries, and woollen-stuffs, candles, tobacco, matches and sugar are manufactured. The great highway from Warsaw to Moscow crosses the government in the south, and its passage through the Berezina is protected by the first-class fortress of Bobruisk. The government is divided into nine districts, of which the chief towns and populations in 1897 are: Minsk, capital of the government (q.v.), Bobruisk (32,940), Berezina (14,297), Vitebsk (85,310), Pinsk (75,996), Polesye (29,663), Yaromir (15,681), and Sluts (1,418,000).

This region was originally inhabited by Slavs. That portion of it which was occupied by the Krivich became part of the Polotsk principality, and so of White Russia; the other portion, occupied by the Dregovich and Drevlyans, became part of Black Russia; whilst the south-western portion was occupied by Yatvyaghs or Lithuanians. During the 12th, 13th and 14th centuries it was divided among several principalities, which were successively incorporated with Lithuania, and later annexed to Poland. Russia took possession of this country in 1793. In 1812 it was invaded by the army of Napoleon I. Archaeological finds of great value, dating from the Neolithic and subsequent ages, have lately been made. (P.A.K.; J.T.B.)

MINSK, a town of Russia, capital of the government of the same name, on the Svisloch, a tributary of the Berezina, at the intersection of the Moscow-Warsaw and Libau-Kharkov railways, 420 m. by rail W. from Moscow. It had, in 1897, 91,494 inhabitants, of whom one-third were Jews of the poorest class; the others were White Russians, Poles and Tatars. Amongst its institutions, the University (founded 1482), the University of the Orthodox Greek Church, and from 1798 to 1853 it was a see of the Roman Catholic Church. The manufactures are few and insignificant. Since the introduction of railways the commercial importance of the place, which formerly was slight, has begun to increase.

Minsk is mentioned in Russian annals in the 11th century under the name of Myen'sk, or Menesk. In 1066 and 1066 it was devastated, first by Izyaslav and afterwards by Vladimir, prince of Kiev. It changed rulers many times until the 15th century, when it became a Lithuanian fief. In the 15th century it was part of Poland, but as late as 1595 it was ravaged by Tatars, and in 1597 by Russians. In the 18th century it was taken several times by Swedes and Russians. Russia annexed it in 1793. Napoleon I took it in 1812.

MINSTER, two towns of Kent, England.

1. MINSTER-IN-THEAN, in the Isle of Thanet parliamentary division, lies on the southern slope of the isle, above the Minster marshes, in the low, flat valley of the river Stour, 4 m. west of Ramsgate, on the South-Eastern & Chatham railway. Pop. (1901), 2338. Its church, dedicated to St Mary, is cruciform, with a western tower, the nave a fine example of Norman work, the transepts and chancel a beautiful Early English addition. The carved choir-stalls are a notable feature. The church belonged to a nunnery, founded at the close of the 7th century. The abbey, a residence close to the church, incorporates portions of the ancient buildings. Fruit-growing is largely carried on in the neighbourhood.

2. MINSTER-IN-SHEPPY, in the north-eastern parliamentary division, lies in the Isle of Sheppey, near the north coast. Pop. (1901), 1306. It is served by the Sheppey light railway from Sheerness, 2 m. west. The village has in modern times become a seaside resort. It has a fine church, dedicated to St Mary and St Sergius, originally attached to a conven of the 7th century, founded by Sexburga of(1) St Botolph, king of Kent. The building as it stands is only a portion of the church founded in the early part of the 12th century by William de Corbeuil, archbishop of Canterbury; it retains also traces of pre-Norman work. It contains some interesting early monuments. The abbey gatehouse remains, and other fragments may be traced. There are oyster beds in the neighbouring shallow sea.

MINSTER (from Lat. monasterium; cf. German Münster), a church of a monastery, or one to which a monastery has been attached. In the 10th century the name was applied to the churches of outlying parishes, and is now given to some of the English cathedrals, such as York, Lincoln, Ripon and Southwell, and to large churches or abbeys, like those of Sherborne, Wimborne or Westminster.

MINSTREL. The word "minstrel," which is a derivative from the Latin minster, a servant, through the diminutives minstelis, minstrellae (fr. mensula, a "chamber," or let), has acquired its special present-day household entertainer late in the 13th century. It was the equivalent of the Low Latin jugularis (Fr. jugeloir, Mid. Eng. jogleur), and had an equally wide significance.

The minstrel of medieval England had his forerunners in the Teutonic scöp (O.H.G. scöp or scöf, a shaper or maker), and to a limited extent in the mimus of the later Roman empire. The earliest record of the Teutonic scöp is found in the Anglo-Saxon poem of Widsith, which in an earlier form probably dates back before the English conquest. Widsith, the far-traveller, belonged to a tribe which was neighbour to the Angles, and was sent on a mission to the Ostrogoth Eormanric (Hermeric or Ermanric, d. 375), from whom he received a collar of beaten gold. He wandered from place to place singing or telling stories in the mead-hall, and saw many nations, from the Picts and Scots in the west to the Medes and Persians in the east. Finally he received a gift of land in his native country. The Complaint of Deor and Beowulf give further proof that the Teutonic scöp held an honourable position, which was shaken by the advent of Christianity. The scöp and the gleeman (the terms appear to have been practically synonymous) shared the general condemnation passed by the Church on the dancers, jugglers, bear-leaders and tumblers. Saxo Grammaticus (Historia danica, bk. v.) condemns the Irish king Hugloke because he spent all his bounty on mimes and jugglers. That the loftier tradition of the scöpas was preserved in spite of these influences is shown by the tales of Alfred and Anlaf disguised as minstrels. With the Normans came the jugulor or jogleur, who wore gaudy-coloured coats and the flat

1 Used by John of Salisbury (Polyhistor, i, 8) as a generic term to cover mini, saltis or solisices, balatares, semilates, gladiates, palaestricites, gigliati, praestigatarios.
shoes of the Latin mimes, and had a shaven face and close-cut hair. Jogleurs were admitted everywhere, and enjoyed the freedom of speech accorded to the professional jester. Their impunity, however, was not always maintained, for Henry I. is said to have put out the eyes of Luc de la Barre for lampooning him. A fairly defined class distinction soon arose. Those minstrels who were attached to royal or noble households had a status very different from that of the motley entertainers, who soon came under the restrictions imposed on vagabonds generally. A joculator regis, Berdie by name, is mentioned in Domesday Book. The king's minstrels formed part of the royal household, and were placed under a reex, a fairly common term of honour in the craft (cf. Adénés li rois). Edward III. had nineteen minstrels in his pay, including three who bore the title of waits. The large towns had in their pay bodies of waits, generally designated in the civic accounts as histriones. A wait under Edward III. had to "pipe the watch" four nights nightly between Michaelmas and Shere Tuesday, and three nights nightly during the remainder of the year. In spite of the repeated prohibitions of the Church, the matter was compromised in practice. Even religious houses had their minstrels, and so pious a prelate as Robert Grosseteste bad his private harper, who bore the title of his bishop's St. Thomas Aquinas (Summa theologia) said that there was no sin in the minstrel's art if it were kept within the bounds of decency. Thomas de Cabham, bishop of Salisbury (d. 1313), in a Penitential distinguished three kinds of minstrels (histriones)—buffoons or tumblers; the wandering scurree, by whom he probably meant the goliardi (see GOLLIARD); and the singers and players of instruments. In the third class he discriminated between the singers of lewd songs and those joculatoris who took their songs from the deeds of princes and the lives of saints. The performances of these joculatoris were permissible, and they themselves were not to be excluded from the consolations of the Church. The Parisan minstrels were formed into a gild in 1321, and in England a charter of Edward IV. (1469) formed the royal minstrels into a gild, which minstrels throughout the country were compelled to join if they wished to exercise their trade. A new charter was conferred in 1604, when its jurisdiction was limited to the city of London and 3 m. round it. This corporation still exists, under the style of the Corporation of the Master, Wardens and Commonalty of the Art or Science of the Musicians of London. During the lifetime of the minstrels, the 10th, 11th and 12th centuries—the minstrel, especially when he composed his own songs, was held in high honour. He was probably of noble or good bourgeois birth, and was treated by his hosts more or less as an equal. The distinction between the troubadour and the jogleur which was established in Provence probably soon spread to France and England. In any case it is probable that the poverty which forms the staple topic of the poems of Rutebeuf (q.v.) was the commonest lot of the minstrel.

Entries of payments to minstrels occur in the accounts of corporations and religious houses throughout the 16th century; but the art of minstrelsy, already in its decline, was destroyed in England by the introduction of printing, and the minstrel of the entertainments given to Elizabeth at Kenilworth was little more than a survival.

The best account of the subject is to be found in E. K. Chambers's Medieval Stage (1903), i. 23-36 and ii. 230-266. See also L. Gautier in Époques françaises (vol. ii., 2nd ed. 1892); A. Schultz, Das höfische Leben zur Zeit der Minnesinger (2nd ed., 1889); T. Percy, Reliques of English Poetry (ed. H. B. Wheatley, 1876); J. Ritson, Ancient English Metrical Romances (1802); J. J. Jusserand, English Wayfaring Life in the Middle Ages (4th ed. 1892).

MIN, botanically Mentha, is a genus of labiate plants, comprising about twenty species of perennial herbs, widely distributed throughout the temperate and sub-tropical regions of the globe, but chiefly in the temperate regions of the Old World. The species have square stems, opposite, aromatic leaves, and a stoloniferous creeping rootstock. The flowers are arranged in axillary clusters (cymes), which either form separate whorls or are crowded together into a terminal spike. The corolla is usually small and of a pale purple or pinkish colour; it has four nearly equal lobes, and encloses two long and two short stamens. Nearly three hundred intermediate forms have been named and described. Many of these varieties are permanent, in consequence of being propagated by stolons.

In Britain ten species are indigenous or naturalized. Mentha viridis, or spearmint, grows in marshy meadows, and is the species commonly used for culinary purposes; it is distinguished by its smooth, sessile leaves and lax tapering flower-spikes. It is probably a cultivated race of the next species, Mentha sylvistris, or horsemint, which chiefly differs from the above in its coarser habit and hairy leaves, which are silky beneath, and in its denser flower-spikes. This plant is supposed to be the mint of Scripture, as it is extensively cultivated in the East; it was one of the bitter herbs with which the paschal lamb was eaten. M. rotundifolia resembles the last in size and habit, but is distinguished by its rounded wrinkled leaves, which are shaggy beneath, and by its lanceolate bracts. The last two species usually grow on damp waste ground. M. aquatica grows in ditches, and is easily recognized by its rounded flower-spikes and stalked hairy leaves. M. piperia, or peppermint (q.v.), has stalked smooth leaves and an oblong obtuse terminal spike of flowers; it is cultivated for its volatile oil. M. pratensis belongs to a group which have the flowers arranged in axillary whors and never in terminal spikes; they are intermediate in appearance to M. viridis. M. sativa grows by damp roadsides, and M. Augustifolia in cornfields; they are distinguished from M. pratensis by their hairy stalked leaves, which in M. arvensis are all equal large, but in M. sativa are much smaller towards the apex of the stem. M. Pulegium, commonly known as pennyroyal, more rarely as fleamint, has small oval obuse leaves and flowers in axillary whors, and is remarkable for its creeping habit and peculiar odour. It differs from all the mints above described in the throat of the calyx being closed with hairs. It is met with in damp places on grassy commons, and was formerly popular for medicinal purposes.

All the genus Mentha abound in a volatile oil, contained in resinous dots in the leaves and stems. The odour of the oil is similar in several species, but is not distinctive, the same odour occurring in varieties of distinct species. Thus the peppermint flavour is found in M. piperia, in M. incana, in Chinese and Japanese varieties of M. arvensis. Other forms of the last-named species growing in Ceylon and Java have the flavour of the common garden mint, M. viridis, and the odour is found in M. sylvistris, M. rotundifolia and M. canadensis. A bergamot scent is met with in a variety of M. aquatica and in forms of other species. Most mints blossoms in August, in cornfields; they are distinguished from M. prattensis by their hairy stalked leaves, which in M. arvensis are all equal large, but in M. sativa are much smaller towards the apex of the stem. M. Pulegium, commonly known as pennyroyal, more rarely as fleamint, has small oval obuse leaves and flowers in axillary whors, and is remarkable for its creeping habit and peculiar odour. It differs from all the mints above described in the throat of the calyx being closed with hairs. It is met with in damp places on grassy commons, and was formerly popular for medicinal purposes.

The name mint is also applied to plants of other genera, Monarda punctata being called horsemint, Pycnanthemum liomilium mountain mint, and Nepeta cataria catmint.

MIN (Lat. moneta; Mid. Eng. mynot), a place where coins are manufactured with the authority of the state. Coins are pieces of metal, of weight and composition fixed by law, with a design upon them, also fixed by law, by which they are identified, their value made known and their genuineness certified. The origin of the word "mint" is ascribed to the manufacture of silver coin at Rome in 269 B.C. at the temple of June Moneta. This goddess became the personification of money, and her name was applied both to money and to its place of manufacture. Metals were used for money at an early stage of civilization, and are well suited to the purpose, owing to their great intrinsic value and their durability, indestructibility, divisibility and rarity. The best metals for coinage are gold, silver, platinum, copper, tin, nickel, aluminium, zinc, iron, and their alloys; certain alloys of gold, silver, copper and nickel have the best combination of the required qualities.

History of Mints.—The earliest metallic money did not consist of coins, but of unminted metal in the form of rings and other ornaments or of weapons, which were used for thousands of years by the Egyptian, Chaldean and Assyrian Empires (see NUMISMATICS). According to Herodotus, the first mint was probably established by Gyges in Lydia towards the end of the 8th century B.C. for the coining of gold, silver and electrum, an

1. Lenormant, La Monnaie dans l’antiquité, i. 82.
the existence of mints before the arrival of the Romans. The Romans at first imported their coins, and no Roman mints were established until about the end of the 3rd century, when coins were being struck at London and Colchester. In Anglo-Saxon times Athelstan appears to have been the first monarch who enacted regulations for the mints. He promulgated laws about the year 928, appointing a large number of "moneymen" or "mystères," London being assigned eight, Canterbury seven, other important towns various numbers and all smaller boroughs one moneyer each. The necessity for so many mints lay in the imperfect means of communication. At an early period, probably about A.D. 1000, the dies were made in London and issued to the other mints. The moneyers, who were elected by the burgesses, were responsible for the manufacture of the coin, and according to Madox were liable at the time of Henry II. to be summoned to Westminster to take part in the trials of the pyx. If there was any deficiency in the weight of the fineness of the coin the moneyers were punished as traitors. These moneyers appear to have been abolished about 1185, when officers were appointed to supervise the coining on behalf of the king, and the name moneyer was applied to contractors who were responsible for the coinage manufactured by them, and not responsible to the king for its weight and fineness. The moneyers continued to manufacture the coin of the realm until the year 1830, when the work was entrusted to civil servants. In the reign of Henry III. the principal officers of the Mint were the master, who manufactured the coin under a contract, the warden or paymaster who acted on behalf of the Crown, the assay master (also a king's officer) who was responsible for the fineness of the coin, the cueantor or superintendent of the engravers of the dies, and the moneyer. One of the most important duties of the warden was the collection from the contractor of the seigniorage which was claimed by the sovereign by virtue of his prerogative as a source of revenue to the Crown. In 1718 Sir Isaac Newton was made master of the Mint, and in that capacity as contractor for the coining he amassed a considerable fortune. As the work of the Mint became more extensive and more complicated other officers were added and their duties were varied from time to time. The present administration of the English Mint is based on arrangements made in 1870, when the establishment was re-organized. The office of master of the Mint is held by the chancellor of the exchequer for the time being, without salary, but the actual administrative work of the department is entrusted to the deputy master and comptroller. The receipt of bullion and the delivery of coin from the Mint is under the charge of the chief clerk, the manufacture of coin is in the hands of the superintendent of the operative department, and the valuation of the bullion by assay, and matters relating to the fineness of the coin are entrusted to the chemist and assayer. The date of the establishment of the Mint in the Tower of London is unknown, There is a reference to it dated 1220 and a clear reference dated 1320. According to Ruding, there were over fifty mints in the reign of Edward the Confessor. After the Norman Conquest the mints increased to about seventy, a greater number than now exists in the world, but they were gradually reduced and in the reign of Edward I. there were only twelve. Ruding enumerates 128 mints operated at various times in the English Kingdom, including some established by usurpation, as in the reign of Stephen by certain barons, and also mints established by grants to ecclesiastics to be worked for their own profit. The provincial mints were all closed just before the reign of Mary, who coined in London only. Charles I. set up small mints in various towns, and for the great re-coining in the reign of William III. mints were established at York, Chester, Exeter, Bristol and Norwich, but were soon abandoned. Wood's copper money for Ireland and America was coined at Wolverhampton (1700-1722), and the tradesmen's tokens were struck at various towns. Copper coins were struck by Boulton at Soho, Birmingham, 4

MINT
in 1788, and a colonial bronze coinage was executed at this establishment as recently as the year 1875. The latter is another mint in Birmingham worked by a private company (“The Mint Birmingham, Limited”), where coinages for foreign governments are executed and in addition silver and bronze colonial coins are occasionally manufactured under the supervision of the London Mint. The existing London Mint was erected on Tower Hill in 1870. Minting in Scotland began in the reign of David I. (1124-1153) and ceased in 1706, two years after the Act of Union, in which it had been expressly stipulated that a mint should be continued in Scotland. Coinage in Dublin began in Anglo-Saxon times and came to an end in the reign of William III.\(^1\) The other Irish mints were of little importance.

**British Dominions.**—Turning to mints in British Dominions beyond the seas, Ruding enumerates twenty-six mints in France and Flanders used by British monarchs between 1186 and 1513, and Anglo-Hanoverian coins were struck at Clausthal, Zellerfeld and Hanover in the period 1714-1837. In India\(^2\) the earliest English mint was that at Madras which was bought by the East India Company in 1620, reorganized more than once and finally closed in 1869. The Calcutta mint was established by the East India Company in 1757, but other mints in Bengal continued to be used till about 1835, when the Calcutta mint was rebuilt. The Bombay mint was set up about the year 1669, but the coins were kept by hammer and anvil until 1806. The Calcutta and Bombay mints are still in operation. A mint was opened in Hong-Kong in 1866 but was closed in 1868 and the machinery sold to Japan. In Australia there are three mints, Sydney, opened in 1855, Melbourne, opened in 1857, and Perth, opened in 1899. Up to 1900 only sovereigns and half-sovereigns were struck at these establishments, but in 1910 arrangements were made for a Commonwealth silver coinage. A mint at Ottawa was opened in 1908 for the manufacture of all Canadian coins as well as English sovereigns.

**Other Countries.**—In the United States the Philadelphia mint was opened in 1792, but only manual or horse power was used until 1836, when steam was introduced. Other mints are now in operation at New Orleans, San Francisco and Denver. In most European countries a single mint situated at the capital is found to be sufficient, but there are six mints in the German Empire and two in Austria-Hungary. In China 26 mints were at work in 1906. There are also mints at Osaka, Bangkok and Teheran, and the Seoul mint was at work in 1904. In Mexico 11 mints formerly existed, but only one, in the city of Mexico, remained open in 1907. In South America there are mints at Lima, Santiago, Buenos Ayres and Tegucigalpa. No mints are in operation in Africa. In all there are nearly 70 mints in the world.

**The Supply of Bullion to Mints.**—In England, in the middle ages, the king was accustomed to send in to the mint the produce of his own silver mines, and claimed the exclusive privilege of purchasing the precious metals. The right of levying seigniorage, however, was sometimes waived by the king to encourage his subjects to bring gold and silver to the mint, and several instances are recorded in which the aid of alchemists was called in to effect the transmutation of baser metals into gold. Seigniorage was abolished for both gold and silver in 1666, when it was provided that no charge should be made at the Mint for coining and assaying. Finally in 1856 the free coinage of silver was brought to an end. At present all gold bullion brought to the Mint is weighed and portions are cut off for assay. The amount of gold in standard ounces (916.6 fine) corresponding to the “imported” bullion is thus ascertained, and on the application of the importer the gold is coined and delivered to him in the form of sovereigns and half-sovereigns at the rate of $3.75. 10d. per standard ounce troy, no deduction being made for wastage, seigniorage, the purchase of alloy metal, or the expense of manufacture. As a considerable time elapses between the receipt of bullion by the Mint and the delivery of the coin, it is generally more profitable for the holder of gold bullion to sell it to the Bank of England or dispose of it in some other way. The result is that the gold presented for coinage is almost always sent from the Bank of England, which suffers no loss of interest during the coinage of the bullion, because bank-notes have already been issued against it. Silver bullion, and the copper, tin and zinc required to make up bronze, are bought by the Mint and manufactured into coin, which is kept in stock and issued as it may be required. One ounce of standard silver, which contains 925 parts of silver and 75 of copper per 1000, is converted into 58.6d. in silver coin, whatever may be the market price of silver bullion. This seldom exceeded 30d. per ounce in the years 1893-1907. Coinage bronze consists of copper 93 parts, tin 4 parts and zinc 1 part, and a ton yields £4.48 in pence or £373, 68.6d. in halfpence or farthings. The difference between the nominal value of silver and bronze coin and its intrinsic value is retained by the state to cover the expenses of manufacture and as a source of profit. It corresponds to the seigniorage levied by the king on all coinages down to the reign of Charles II. In return, the Mint receives at its nominal value for recoinage the worn gold and silver coin which is withdrawn from circulation by the Bank of England and some other banks. In spite of the cost of this recoinage, however, the profit on the issue of new silver and bronze coin is large in each year the total expenditure of the Mint is more than covered by the amount of bullion obtained for immediate conversion into coin. In general, only old coin, ingots resulting from the melting of coin, and “fine” ingots are received. Fine gold ingots (the “bar gold” of commerce) are usually about 400 oz. troy in weight, and contain from 990 to 999.5 parts of gold per 1000, the remainder being chiefly silver. Fine silver ingots usually weigh from 1000 to 1200 oz. troy and contain from 995 to 999 parts of silver per 1000. The ingots are valued by weighing and assaying, and a calculation is made as to the amount of copper required for melting them to produce the standard alloy. The two standard alloys consist respectively of gold 916-6, copper 83-3 and of silver 925, copper 75. All gold coins received at the Bank are weighed on automatic balances (see below) and those below the lowest legal current weight are separated. The lowest current weight is 122.5 grains for sovereigns and 61.25 grains for half-sovereigns corresponding to losses by wear of about 0.6% and 0.8% respectively. The average age on withdrawal is about 24 years for sovereigns and 15 years for half-sovereigns. Silver coins are not weighed but are selected for withdrawal when they present a worn appearance. The average deficiency in weight of worn silver coin in circulation at the Mint is about 10%, and the mean age somewhat less than 30 years. In Europe generally little difficulty is experienced in procuring refined gold and silver for coinage. In Australia, the United States, Japan and some other countries, the Mints receive unrefined gold from the mines and refine it before it is coined. A charge for refining is made in all cases. A refinery was attached to the London Mint from 1816 to 1851, but was then let on lease and left to private enterprise. The operations employed in the manufacture of gold and silver coin are as follows:

1. Melting the metal and casting it into bars. (2) Rolling the bars into strips or “fillets.” (3) Cutting out disks or blanks from the fillets. (4) Adjusting the weight of the blanks (this is omitted in some mints). (5) “Marking” or edge-rolling the blanks to produce a raised rim or to impress a design on the edge. (6) Annealing the blanks and (in some mints) cleaning them in acid. (7) Striking the blanks between dies surrounded by a collar. (8) Weighing each coin. Among the incidental operations are (a) the valuation of the bullion by weighing and assaying it; (b) rating the bullion, or calculating the amount of copper to be added to make up the standard alloy; (c) recovering the values from the purchase of alloy metals, and from refining. (d) By the act for the regulation of the Mints (or “ sweeps”); (e) assaying the melted bars; (f) “pyxing” the finished coin or selecting specimens to be weighed and assayed; (g) “telling” or counting the coin.

**Melting.**—Formerly bullion was melted in crucibles made of refractory clay, but they are liable to crack and require careful handling

\(^1\) Grueber, op. cit. p. liv.

\(^2\) Ruding, op. cit. ii. 245.

\(^3\) W. J. Hocking, *Catalogue of Coins in the Royal Mint*, i. 272, 275 and 279.
These were succeeded by iron crucibles, especially for melting silver, and these have now been generally replaced by graphite (plumbago) crucibles made of a mixture of clay and graphite. Good graphite crucibles can be used many times in succession if they are heated gradually each time, but they are usually discarded after about fifteen or twenty meltings. At the Royal Mint gold is melted in crucibles about 10 in. in height and 8½ in. in diameter at the widest part. The charge is from 1200 to 1500 oz. (37.3 to 40.5 kilograms) of metal. The furnace is 12 in. square and 2 ft. deep from the fire-bars to the cover. An old crucible is cut off about 2 in. from the bottom and the bottom piece is inverted and placed on the fire-bars as a support for the crucible. The “muffle,” a graphite cylinder 6 in. in height, is placed on the crucible to allow room for long bars to be melted in the crucible and to prevent the surrounding coke from falling into it. The flue, of about 5 in. square, communicates with a stack 60 ft. high. In many mints the flues pass into condensing chambers where volatilized gold and silver are recovered. The crucible is at a red heat when the gold is charged in, the copper being added last, and a graphite lid put on the crucible to check loss by volatilization. The charge is completely melted in about half an hour, and is then thoroughly mixed by stirring with a graphite rod. The crucible is then lifted out by circular tongs suspended in such a way that two men can take part in the operation. The contents are poured by hand into moulds which are contained side by side in an iron carriage running on wheels, fig. 1, OP. The molten gold, which is of a pale green colour, solidifies at once in the iron moulds, and the bars can be taken out immediately. Bars from which sovereigns are to be coined are 22 in. long, 1½ in. wide and ½ in. thick, and about seven such bars are cast from one pot. The rough edges of the bars are removed by a circular revolving file, and the hollow ends are cut off. Pieces are cut out for assay, and the bars are then ready for rolling. The amount of gold melted in an ordinary day’s work is two tons to two and a half tons, of the value of £250,000 to £300,000. For silver larger crucibles are used, containing about 5000 oz. troy (155 kilograms). They are heated in circular furnaces 21 in. in diameter and lifted out with circular tongs suspended from a travelling crane which is worked by electricity. The crucible is placed in the pouring cradle, which has been in use since 1816, and is shown in fig. 1. Here A is the iron cover surrounding the furnaces, B is the revolving lid of a furnace, and C is the flue, common to two furnaces and leading to the stack. The handle D, acting through the gear wheels E, F, G and H, turns the cogwheel K, which moves the curved rack of the cradle and tips the crucible M. The molten metal is poured into the moulds N, which are carried on wheels running on rails O. The parts of the range of moulds are brought tightly together and held in position by the bars O and the screw P, and when one mould is filled the carrier is moved forward on its rails by wheels worked by a handle also shown in the figure. In some older mints still larger crucibles are used, containing various amounts up to about 1000 kilograms or over 30,000 oz. In foreign mints the molten metal is generally transferred from the crucible to the moulds by dipping crucibles or iron ladles coated with clay. Gas is used as fuel for the melting furnaces at Philadelphia. It is cleaner than coke and is said to save time and to reduce the loss of the precious metals. At Denver and Ottawa the fuel used is “first distillate” oil, which is found to be cheaper than either naphtha or gas. The oil is pumped from buried tanks and warmed to about 90° F. before it reaches the burners at the furnaces. At the Denver mint the crucibles are used for from twelve to fifteen meltings with oil fuel, whereas they were soon destroyed when gas was employed. A charge of 6000 oz. of gold is melted in about an hour. The melting losses amount to about 0-2 per 1000 of gold and 0-6 per 1000 of silver in the Royal Mint. The losses are caused by volatilization, by the absorption of metal by the crucible, stirring rod, &c., and by occasional projection of particles from the pot into the furnace. The ash-pit is lined with iron plates to facilitate the recovery of metal accidentally split. All crucibles and other materials which might contain precious metal are ground up and washed in a pan, and the puddings together with a selection from the floor sweepings are remelted. The residues (the Mint “swEEP”) are sold to refiners or ore-smelters.

Rolling.—The cast bars are reduced to the thickness of the coin by repeated passages between rolls. These are cylinders of cast iron or steel from 6 in. to 15 in. in diameter set parallel to one another with a small interval between, and revolved by electric or steam power. They are divided into breaking-down and finishing rolls, the latter being of smaller diameter than the former. The power is usually transmitted through toothed wheels, each roll being driven independently in some cases, while sometimes power is applied to the lower roll only, the upper roll being coupled to it. The
power required for breaking down mint bars amounts to from 25 to 35 h.p. The bars are fed to the rolls by hand. Heavy pinchers are applied at first, the space between the rolls being diminished by a hand-screw after each passage of the bars through them. When the bars are nearly to gauge, light pinchers are given to the rolls requiring 5 h.p. only. The reduction in thickness of the bars is accompanied by a slight increase in their width and a very great increase in their length, so that it is generally necessary to cut partly rolled bars into two parts to keep them from becoming too long. By rolling bars through the rolls, the bars are hardened, and to facilitate further reduction they are usually softened by annealing before being passed to the finishing rolls. In some mints the fillets are annealed frequently, the fillets for one-mark pieces at the Berlin mint, for example, being annealed four times in the course of rolling. In this case the bars are reduced from 53 mm. in thickness to 14 mm. by being passed thirteen times through the rolls. At the Vienna mint the practice has been to anneal silver bars after each passage through the rolls. On the other hand, in the English mints, silver is subjected to very strong pressure and has made it possible to discontinue the annealing of partly rolled bars. In the Royal Mint silver bars are annealed once during rolling by passing through a Bates & Pearc furnace. The fillets are measured by the gauge-plate shown in fig. 2. When they have been reduced to the correct thickness they are examined by the "tryer," who cuts out one or two blanks from each fillet with a hand machine and weighs them on a delicate balance. If the weight of the blank is below the standard weight, a somewhat larger cutter is used, so that the blanks may be of correct weight. If the blank is too heavy the fillet may of course be passed through the rolls again.

Remedy.—The degree of accuracy required is indicated by the "remedy" allowance for weight, which is different for each coin, and the maximum difference from the standard weight of the coin allowed by law. Thus for a sovereign of 22 carats and an amount of 76.3 per 1000. As the mean thickness of a sovereign is 0.0466 in., the remedy for weight corresponds to a difference of less than 0.0001 in. in the thickness of the fillet. The remedy for English silver coins varies from 2 to 1.5 per 1000 in the case of the crown, to 0.007 gram or 1.17 per 1000 in the case of the silver penny. The remedies for weight on foreign coins are in general greater than those allowed in the British Empire, averaging 2 to 1 per 1000 for gold coins. Reference may be made to the limit of the coin if they contained between 916 and 918-6 parts of gold per 1000. Remedies are intended to cover accidental variations from the exact standard and are now generally used in this way. In former times, however, advantage was sometimes taken of the remedy as a means of profit. In the reign of Queen Elizabeth, for example, a device was employed whereby a gold coin was to be unwound from a collar which surrounds the blank, and then the coin was melted. The amount of the error removed from silver blanks containing 900 to 925 parts of silver per 1000 is from 0 to 1.0 per 1000. The process will probably be abandoned as soon as the tarnishing of the metal during rolling and annealing can be avoided.

Cooling Blanks.—The cutting machine used in the Mint is shown in fig. 3. The revolution of an eccentric A causes two short steel cylinders or cutters mounted on a block of iron B, suitably guided, to enter two holes in a plate fixed to the bed of the machine. When the fillet FF is brought above the hole, the cutters descend and force disks of metal through the holes. After each descent of the cutters, the fillet is advanced by small gripping rolls C C' worked by a ratchet wheel E driven from the shaft which bears the eccentric A. The disks fall down the tube G to a receptacle on the floor. The cutters are so placed as to remove blanks in the manner shown in fig. 4, this arrangement leaving less "scissel" or residual metal than any other. In the case of very large silver coins only one blank is cut in the width of the fillet, but bronze fillets are made wider so that three penny blanks are cut out at each stroke of the machine. The cutting machines at the Mint work at 160 revolutions per minute, so that each of the eleven machines would be capable of cutting 19,200 blanks in an hour; it could be fed continuously. The scissel, which amounts to about 30% of the metal operated on, is returned in bundles to the melting furnaces. The blanks are then passed to an edge rolling machine, by which they are reduced to the correct thickness. The edge of the coin is formed by a rim to protect the finished coin from wear. This operation is carried out uniformly, because originally the edges were not only thickened but were also marked with an inscription. This is still done in the case of many of the coins. The letters are sometimes sunk and sometimes raised. Like the graining or "milling" on the edge of brass coins, the inscriptions were intended to put a stop to the practice of clipping and filing coins, which was prevalent in the 16th and 17th centuries. They also render the manufacture of counterfeit coin more difficult. At the Royal Mint the blanks are passed between the parallel faces of a revolving steel plate and fixed block. The plate has a circular groove in its face and the block has a corresponding curved groove. The blank passes between these grooves. The distance between the block and the plate is adjusted so as to be slightly less than the diameter of the blank, and the result is that the edge of the blank is thickened and its diameter reduced before it escapes from the machine. About 720 blanks are passed through this machine per minute. In marking machines in some foreign mints the groove is in the periphery of the revolved blank and the grooved block is curved (fig. 5).

Annealing and Blanking the Blanks.—The blanks are next softened by annealing, and are then thoroughly cleaned before being passed to the coining presses. In England gold and copper blanks are first annealed by passing them through the fire of the furnace, and after their passage through the furnace the blanks are polished in colanders with water and dried with sawdust in a rotating drum. Silver blanks, however, are passed through rotary gas furnaces in which no attempt is made to exclude the air. The blanks are charged into a hopper at one end of the furnace and conducted towards the other end. Some of the copper from the blank raises the percentage of silver contained in them, and this is allowed for by adding an equivalent amount of copper to the metal before it is melted. The amount of copper removed from silver blanks containing 900 to 925 parts of silver per 1000 is from 0.6 to 1.0 per 1000. The process will probably be abandoned as soon as the tarnishing of the metal during rolling and annealing can be avoided.

Presses.—The blanks are converted into coin by receiving an impression from engraved dies. Each blank is placed on the lower of two dies and the upper die is brought down forcibly upon it. The pressure causes the soft metal to flow like a viscous liquid, but it is prevented from escaping by a collar which surrounds the blank while it is being struck. The collar may be plain, or creased ("milled"), or engraved with some device. In the last case the collar must be made in two or more pieces, as otherwise the coin could not be removed without injury. The collar for striking English crown pieces is made in three sections now that raised lettering is put on the edge of the coin. Sunk letters, such as occur on the edges
of many foreign coins, are put on by the marking machine, and a plain collar is used in striking.

The coining presses now used are all modifications of the lever press invented by Unlhorn of Grevenbroich near Cologne in 1839. The

press in use at the Royal Mint since 1882 is shown in figs. 6 and 7. The lever M worked from the front of the machine causes the fly-wheel to be connected with the driving-wheel and the machine starts. The blanks are placed in the slide J and the lowest one is carried forward to the die in two successive movements of the "layer-on" K, a rod working backwards and forwards on a horizontal plate and actuating the finger L, fig. 8. The lower die is firmly fixed
to the bed of the machine, and the blank is placed exactly upon it. The collar A is then raised by the lever G so as to encircle the blank, and the upper die which is held at A is brought down. This is done by the little crank B on the axle of the fly-wheel, acting through the rod C, and the bent lever D, which forms a toggle-joint at E with the vertical piece of metal below it. The straightening of the toggle-joint when C is pushed forward forces A down to strike the coin. The reverse movement of D lifts up the upper die and the collar drops simultaneously so that its upper surface is level with the face of the lower die on which the finished coin lies. Another blank moved on by the finger L pushes off the finished coin which falls down the tube N. The diagram, fig. 9, shows the relative position of the dies and levers more clearly. The dies and collar are shaded. The presses

at the Mint strike from 90 to 125 coins per minute, most of them working at the rate of 110 coins per minute. There are 19 presses and it is possible with these to strike between 700,000 and 800,000 pieces in an ordinary working day.

Weighing the Coins.—Gold and silver coins are examined and tested by weighing, and each coin is then weighed separately by being passed over delicate automatic balances. The first automatic balance for weighing single coins was introduced at the Bank of England in 1843, and was designed by William Cotton, the deputy governor of the Bank. In 1851 these balances, improved by Richard Pilcher, were introduced at the Royal Mint, and modifications of them are now used at most foreign mints. For mint use it is necessary that they shall distinguish between "light," "heavy," and "good" coins which do not differ from standard by more than the small weight known as the "remedy" (see above). The balances used in the Royal Mint were further improved by J. T. Butler in the year 1889. The balance consists essentially of a beam with two scale pans, one for the coin and the other for the counterpoise. The beam is released and in the course of a second or so takes up a certain position dependent on the relative weights of the coin and counterpoise. Its position is then fixed by an automatic grip, and the coin falling down a shoot enters one of three compartments of a box, according to the position of the beam when it is arrested. The chief working parts are shown in fig. 10. The beam A is of steel made in one piece, about 11 in. long. Its centre and end knife edges are shown in fig. 11. The scale pan for the coin is shown in fig. 12. B is the pan on which the coin rests, at a point above the beam. The coins are placed in a roulieu in the hopper C and the lowest one is pushed on to the pan B by a slide not shown in the figure. While the coin is being moved the hanger D is held firmly by the forceps E to prevent the pan from being pushed sideways. The forceps are then opened and the beam released, but at this moment the levelling bar F is allowed to drop momentarily by a bent lever G acting on the pin G', until the ends of F press down on a stirrup in each hanger at H, H. This brings the beam to a horizontal position. The lever G at once
MINTO, EARLS OF

weight M, and the movement of the beam and its hangers proceeds farther in the same direction. After about a second from the time of the final release of the beam, the forces E again close and the hanger D is held firmly in its new position. The rod N is then lowered and allows the indicating finger O, which is pivoted at P, to fall until it rests on the stirrup R, which is part of the hanger D. The extension of O holds down the right-hand end of the rod S which is also pivoted at P, and enables its end to fit into one of the three inverted steps on the bottom of the hanger Q. The position of the stirrup is thus determined. It stops over one of three orifices in the bottom plate of the balance. If the coin is light the rod S fits into the uppermost step and the shoot stops over the right-hand slot. If the coin is heavy, S fits into the lowest step and the shoot stops over the left-hand slot. The middle step and slot are for coins width M, and the movement of the beam and its hangers proceeds farther in the same direction. After about a second from the time of the final release of the beam, the forces E again close and the hanger D is held firmly in its new position. The rod N is then lowered and allows the indicating finger O, which is pivoted at P, to fall until it rests on the stirrup R, which is part of the hanger D. The extension of O holds down the right-hand end of the rod S which is also pivoted at P, and enables its end to fit into one of the three inverted steps on the bottom of the hanger Q. The position of the stirrup is thus determined. It stops over one of three orifices in the bottom plate of the balance. If the coin is light the rod S fits into the uppermost step and the shoot stops over the right-hand slot. If the coin is heavy, S fits into the lowest step and the shoot stops over the left-hand slot. The middle step and slot are for coins.

Trial of the Pxn.—Periodical examinations of the coins issued by the Mint have been made from very early times in England by persons appointed by the Crown. Specimens are selected from the finished coin and are put into a box or “pxn.” At intervals these boxes are opened, and are assayed by a jury of skilled persons and the results reported to the Crown. A trial of the pxn is mentioned in the Landowne MSS. as having taken place in the reign of Henry II., but the practice had probably originated much earlier. The trial is now held annually by a jury consisting of freemen of the Company of Goldsmiths. Coins from the London and Australian mints are examined. The Company has been entrusted with the duty since the time of James I. Coins of foreign mints are generally submitted to examination by a committee of eminent chemists and metalurgists whose report is published in the official journals.

A full account of the work of the Mint, with valuable tables giving the amount of the coinage of gold and silver and bronze in the United Kingdom and the colonies in detail, and a comparison of foreign coins, will be found in the Annual Reports of the Depute Master and Comptroller of the Mint, which have been published since 1870.

MINTO, EARLS OF. The Scottish border family of Elliot which has held the earldom of Minto since 1813 has had many distinguished members. Sir Gilbert Elliot, bart. (1651-1718), and his son and successor, another Sir Gilbert Elliot (1663-1760), were both celebrated Scottish judges and both took the official title of Lord Minto. The elder Sir Gilbert was sentenced to death for his share in the rising of the earl of Argyll in 1665, but was afterwards pardoned; the younger Sir Gilbert was a scholar and an agriculturist. Among the children of the latter were John Elliot (d. 1808), a naval officer, who served as governor of Newfoundland, and was succeeded in 1820, and Andrew Elliot, the last English governor of Newfoundland; and the poetess Jane, or Jane, Elliot (c. 1727-1805), who wrote the popular ballad “Flowers of the Forest.” The eldest son, Sir Gilbert Elliot (1722-1777), who became the third baronet in April 1766, was a member of parliament from 1753 to 1777, and a friend and follower of the earl of Bute. He filled several public offices, and Horace Walpole said he was “one of the ablest members of the House of Commons.” His second son was the diplomatist, Hugh Elliot (1752-1830), who represented his country at Munich, at Berlin, at Copenhagen and at Naples. He was governor of Madras from 1814 to 1820, and he died on the 10th of December 1830.

See the Memoirs of the Right Hon. Hugh Elliot, by the countess of Minto (Edinburgh, 1866).

The third baronet’s eldest son was GILBERT ELLIOT, 1st earl of Minto (1751-1814). About 1763 Gilbert and his brother Hugh were sent to Paris, where their studies were supervised by David Hume and where they became intimate with Mirabeau. Having passed the winters of 1766 and 1767 at Edinburgh University, Gilbert entered Christ Church, Oxford, and on quitting the university he was called to the bar. In 1776 he entered parliament as an independent Whig. He was, however, never a very strong member; he helped in the attack on Warren Hastings and Sir Elizah Impey, and on two occasions was an unsuccessful candidate for the office of speaker. In 1794 Elliot was appointed to govern Corsica, and in 1797 he assumed the additional names of Murray-Kynynmond and was created Baron Minto. From 1799 to 1801 he was envoy-extraordinary to Vienna, and having been for a few months president of the board of control he was appointed governor-general of India at the end of 1806. He governed with great success until 1813. He was then created Viscount Melgund and earl of Minto. He died at Stevenage on the 21st of June 1814 and was buried in Westminster Abbey.

The earl’s second son was Admiral Sir George Elliot (1784-1865), who as a youth was present at the battles of Cape St. Vincent and Camperdown, and who was born in 1780 and died in 1865. A nephew of the earl was Sir Charles Elliot (1801-1875) also an admiral, who took a prominent part in the war with China in 1860. Afterwards he was governor of Bermuda, of Trinidad and of St. Helena.

GILBERT ELLIOT-MURRAY-KYNYNMOND, 2nd earl of Minto (1782-1859), eldest son of the 1st earl, was ambassador to Berlin from 1822 to 1834, first lord of the admiralty from 1835 to 1841 and lord privy seal from 1842 to 1845. His influence in the Whig party was partly due to the fact that his daughter, Frances, was the wife of Lord John Russell.
MINTO, W.—MINUSINSK

His son William Hugh, the 3rd earl (1814–1891), was the father of the 4th earl, Gilbert John Elliot-Murray-Kynynmond (1845–1903), who joined the Scots Guards in 1867. In 1874, in the capacity of a newspaper correspondent, he witnessed the operations of the Carlists in Spain; he took service with the Turkish army in the war with Russia in 1877 and served under Lord Roberts in the second Afghan War (1878–79), having narrowly escaped capture by the company of Sir Louis Cavagnari Kabul. He acted as private secretary to Lord Roberts during his mission to the Cape in 1881; as military secretary to Lord Lansdowne during his governor-generalship of Canada from 1883 to 1885; and as chief of the staff to General Middleton in the Riel Rebellion in Canada (1885). Having succeeded to the earldom in 1891 he was appointed governor-general of Canada in 1898. His term of office (1898–1904) was distinguished by a visit of the prince and princess of Wales to the colonies. In 1905, on the resignation of Lord Curzon, Lord Minto was appointed viceroy and governor-general of India, retiring in 1910.

The 4th earl’s brother, the Hon. Arthur Ralph Douglas Elliot (b. 1846), editor of the Edinburgh Review, was a member of parliament from 1880 to 1892 and again from 1898 to 1906, and from 1903 to 1906 he was financial secretary to the treasury. Sir Francis Edmund Hugh Elliot (b. 1851), a grandson of the 2nd earl, became British minister at Athens in 1905.

See Hon. G. F. S. Elliot, The Border Ellits and the Family of Minto (Edinburgh, 1897); the article India; History; also the Life and Letters of the first Earl of Minto, 1751–1850 (1874) and Lord Minto (1877), both edited by the countess of Minto; and Sir J. F. Stephen, The Story of Nuncomar and the Impeachment of Sir E. Impey (1885).

MINTO, WILLIAM (1843–1893), Scottish man of letters, was born at Auchintoul, Aberdeenshire, on the 10th of October 1843. He was educated at Aberdeen University, and spent a year at Merton College, Oxford. He was assistant professor under Alexander Bain at Aberdeen for some years; from 1874 to 1878 he edited the Examiner, and in 1880 he was made full professor of logic and English at Aberdeen. In 1872 he published A Manual of English Prose Literature, which was distinguished by sound judgment and sympathetic appreciation; and his Characteristics of English Poets from Chaucer to Shirley (1874) showed the same high qualities. His other works include: The Literature of the Georgian Era (1894) edited with a biographical introduction by W. Knight a monograph on Defoe in the English Men of Letters series (1879); three novels of small importance, and numerous articles on literary subjects in the 9th edition of the Encyclopaedia Britannica. He died on the 1st of March 1893.

MINTURNAE, an ancient city of the Aurunci, in Italy, situated on the N.W. bank of the Liris with a suburb on the opposite bank 1½ m. from its mouth, at the point where the Via Appia crossed it by the Pons Titeoli. It was one of the three towns of the Aurunci which made war against Rome in 314 B.C., the other two being Ausona (see SESSA AURUNCA) and Vescia; and the Via Appia was made two years later. It became a colony in 295 B.C. In 88 B.C. Hannibal in his flight from Sulla hid himself in the marshes of Minturnae. The ruins consist of an amphitheatre (now almost entirely demolished, but better preserved in the 18th century), a theatre, and a very fine aqueduct in opus relictum, the remains of which are of various colours arranged in patterns to produce a decorative effect. Close to the mouth of the river was the sacred grove of the Italic goddess Marica. It is still mentioned in the 6th century, but was probably destroyed by the Saracens, and its low site, which had become unhealthy, was abandoned in favour of that of the modern town of Minturno (known as Traetto until the 19th century), 459 ft. above sea-level. A tower at the mouth of the river, erected between 961 and 981, commemorates a victory gained by Pope John X. and his allies over the Saracens in 915. It is built of Roman materials from Minturnae, including several inscriptions and sculptures.

See T. Ashby in Mélanges de l’École française de Rome (1903), 413.

MINUCIUS, FELIX MARCUS, one of the earliest if not the earliest, of the Latin apologists for Christianity. Of his personal history nothing is known, and even the date at which he wrote can be only approximately ascertained. Jerome (De vir. ill. 78) speaks of him as "Romae insignis causidicus," but in this he is probably only improving on the expression of Lactantius (Inst. div. v. 1) who speaks of him as "non ignobilis inter causidicos loci." He is now exclusively known by his Octavius, a dialogue on Christianity between the pagan Caecilius Natalis and the Christian Octavius Januarius, a provincial lawyer, the friend and fellow-student of the author. The scene is pleasantly and graphically laid on the beach at Ostia on a holiday afternoon, and the discussion is represented as arising out of the homage paid by Caecilius, in passing, to the image of Serapis. His arguments for paganism (possibly modelled on those of Celsus) are taken up seriatim by Octavius, with the result that the assailant is convinced. Minucius himself plays the part of umpire. The form of the dialogue is modelled on the De natura deorum and De divinatione of Cicero and its style is both vigorous and elegant if at times not exempt from something of the affectation of the age. Its latinity is not of the specifically Christian type. If the doctrines of the Divine unity, the resurrection, and future rewards and punishments be left out of account, the work has the character of an exposition of Christianity than of a philosophical and ethical polemic against the absurdities of polytheism. While it thus has much in common with the Greek Apologies it is full of the strong common sense that marks the Latin mind. Its ultimate appeal is to the fruits of faith.

The Octavius is admittedly earlier than Cyprian’s Quod idola dixi non sinit, which borrows from it; how much earlier can be determined only by settling the relation in which it stands to Tertullian’s Apologieum. Since A. Ebert’s exhaustive argument in 1886, repeated in 1896, the priority of Minucius has been generally admitted; the objections are stated in the Dict. Chr. Biog. article by G. Salmon. Editions: F. Sabaeus-Brixianus, as BK. viii. of Arnobius (Rome, 1834); F. Balduinus, first separate edition (Heidelberg, 1856); Migne, Patr. Lat. iii. 339. Hahn in Corp. Sor. Eccl. Lat. 1910, p. 590. A. H. Holdeman, ed. Excultation; R. E. Wallis, in Ante-Nic. Fathers, vol. iv.; A. A. Brodbriu’s Pagan and Pagan. Literature: In addition to that already cited see H. Boenig’s art. in Hauck-Herzog’s Realencycl. vol. 13, and the various histories of early Christian Literature by A. Harnack, G. Kräger, A. Elhhard and O. Bardenhewer.

MINUET (adapted, under the influence of the Italian minuetto, from Fr. menuet, small, pretty, delicate, a diminutive of menu, from Lat. minuus; the word refers probably to the short steps, pas menus, taken in the dance), a dance for two persons, in 3/4 time. At the period when it was most fashionable it was slow, ceremonious, and graceful (see DANCE). The name is also given to a musical composition written in the same time and rhythm, but when not accompanying an actual dance the pace was quicker. An example of the true form of the minuet is to be found in Don Giovanni. The minuet is frequently found as one of the movements in the Suits of Handel and Bach. Haydn introduced it into the symphony, with little trace of the slow grace and ceremony of the dance. In the hands of Beethoven it becomes the scherzo.

MINUSINSK, a town of Russia, in East Siberia, and the government of Yeniseisk, 180 m. S.S.W. of Krasnoyarsk railway station, and 5 m. from the right bank of the Yenisei, in a fertile prairie region. Pop. (1897), 10,255. It is a centre for trade with the native populations of the Sayan Mountains and northwestern Mongolia. It has an excellent natural history, ethnographical and archaeological museum (1877), with a library and a meteorological station. Coal and iron abound in the vicinity.

This name occurs in six inscriptions of the years 211–217 found at Constantine (Cirta), North Africa (C.I.L. vol. viii.). Like the other North African fathers Tertullian, Cyprian, Arnobius and Lactantius, he was a lawyer. Some use may have been made of rhetorical expressions of M. Cornelius Fronto of Cirta (6. A.D. 170).
MINUTE (Lat. minutus, small; minuere, to make less), an
adjective meaning of very small, petty, or trifling; also
extremely precise. In this sense the word is pronounced m-nil.
As a substantive and pronounced m-nil the word (usually in
the plural) is applied to a written summary of the transactions
of a meeting of a public or other body, or to a memorandum of
instructions, &c. A Treasury minute in the United Kingdom
is an official memorandum authorizing certain procedure.
“To minute” is to draw up such a summary or memorandum.
More particularly, “minute” is used of the sixtieth part of
any unit; in time, of an hour; and in astronomy, geometry,
and geography, &c., of a degree of the measurement of a circle.
The sexagesimal system of division was originally used by
the ancient Babylonian astronomers, was adopted by Ptolemy,
and the sixtieth part of a degree, and its further subdivision
into sixty parts, was called in Latin pars minuta prima, and
pars minuta secundae respectively, hence the English “minute”
and “second.”

MINUTE MEN: In the American War of Independence, milita-
ry men who had undertaken to turn out for service at a minute’s
notice. In Massachusetts the minute men were enrolled by
an act of the provincial congress of the 23rd of November 1774,
and in 1775 they were also called to arms, 10,000 prior to the outbreak
of the war. The Americans who fought in the opening action
of Lexington were “minute men.”

MIOCENE, in geology, the system of strata which occurs
between the Oligocene and the Pliocene. The term, derived
from the Greek μικρον, less, and καινος, recent, was introduced
by Sir Charles Lyell, as indicating palaeontologically a less
percentage of recent species than is found in the Pliocene.
Variable lacustrine, estuarine and marine deposits, especially
characterized by soft calcareous sandstones and conglomerates
(“molasse”) and sandy shell-beds (“faluns”), make up the Miocene
system of the Neogene or newer Tertiary in Europe and
western Asia, where it attains its fullest development.

A. de Lapparent’s classification is here adopted:

1. Oligocene—shale and sandstone,
2. Lower Miocene—laminated sandstone,
3. Middle Miocene—lignite,
4. Upper Miocene—sandstone;
5. Pliocene—sandstone and conglomerate.

The Mio-
cene is subdivided into stages, of which:

(b) Tortonian: Marine marls with Ancillaria glansiformis, Conus
antiquus, Ranella marginata, Trochus putulus, Volva rarisimae.
Laminated fresh-water limestones of Oeningen with fish, countless
invertebrates, etc., forming four or five strata; the
latter three being succeeded by layers of Cerithium pictum, C. rubiginosum, Ostrea gengisina, Mastra podolica,
and Tapes gregarius.

Stages IV. and V. represented in north-western France by marines strips (Cardita striatissima), and in Algeria and
Morocco by marine marls and limestones.

II. Vindobonian—shale and sandstone.

III. Aquitanian—shale and sandstone.

(b) Torritonian: Marine marls with Ancillaria glansiformis, Conus
antiquus, Ranella marginata, Trochus putulus, Volva rarisimae.
Laminated fresh-water limestones of Oeningen with fish, countless
invertebrates, etc., forming four or five strata; the
latter three being succeeded by layers of Cerithium pictum, C. rubiginosum, Ostrea gengisina, Mastra podolica,
and Tapes gregarius.

Stages IV. and V. represented in north-western France by marines strips (Cardita striatissima), and in Algeria and
Morocco by marine marls and limestones.

II. Vindobonian—shale and sandstone.

III. Aquitanian—shale and sandstone.

(b) Torritonian: Marine marls with Ancillaria glansiformis, Conus
antiquus, Ranella marginata, Trochus putulus, Volva rarisimae.
Laminated fresh-water limestones of Oeningen with fish, countless
invertebrates, etc., forming four or five strata; the
latter three being succeeded by layers of Cerithium pictum, C. rubiginosum, Ostrea gengisina, Mastra podolica,
and Tapes gregarius.

Stages IV. and V. represented in north-western France by marines strips (Cardita striatissima), and in Algeria and
Morocco by marine marls and limestones.
MIQUEL—MIRABEAU

his return to Florence received orders to proceed to Corsica, which, after its evacuation by the British, was in a state of anarchy. In Corsica he allied himself with Joseph Bonaparte, and after pacifying the island returned to Italy. Recalled by his Doyen in 1798 because of his refusal to foment insurrection in Italy, he spent some time in retirement, but he was in the diplomatic service in Holland at the revolution of 18. Brumaire (Nov. 9, 1799). Under the consulate he was secretary-general at the ministry of war, and a member of the council of state, and was sent on a second mission (1801–1802) for the pacification of Corsica. In 1806 he joined Joseph Bonaparte in Naples as minister of the interior, afterwards following him to Spain as comptroller of the household, but he returned to France in the retreat of 1815. Next year he was created comte de Mélito, and during the Hundred Days he served as commissary extraordinary with the XII. Army division. He took no part in politics after Waterloo, where his son-in-law, General J. J. Jamin, was killed, and his son-in-law, mortally wounded. He visited Joseph Bonaparte in America in 1835, and then spent some years in Germany with his daughter, whose second husband, General von Fleischmann, represented the king of Württemburg in Paris in 1831. He was admitted in 1835 to the French Academy on the merits of his translations of Herodotus (Paris, 1832) and Diodorus (Paris, 1835–1838). He died in Paris on the 5th of January 1841.

Miot de Mélito had kept a diary which, arranged for publication by his son-in-law, General von Fleischmann, covers the years from 1798 to 1815, and is of interest for the history of the Bonaparte family and Joseph's domination in Spain. Published in France in 1858, it was translated into English by Mrs. C. Hoey and J. Lillie (2 vols., 1881); and also into German (Stuttgart, 1866–1867). See Albert Gaudin, Les Arrêts Miot (Ajaccio, 1866).

MIQUEL, JOHANN VON (1829–1901), German statesman, was born at Neuenhaus, Hanover, on the 15th of February 1829, being descended from a French family which had emigrated during the revolution. He began his career at the universities of Heidelberg and Göttingen. Studying the writings of Karl Marx he became a convert to an extreme revolutionary, socialistic and atheistic creed; but though he entered into correspondence with Marx, with the object of starting a revolutionary movement, he does not appear to have taken any overt part in the events of 1848–1849. Further study of political economy soon enabled him to pass out of this phase, and in 1850 he settled down to practice as an advocate at Göttingen. He acquired repute as an able lawyer and a rising politician, and especially for his knowledge of financial questions. He was one of the founders of the German Nationalverein, and in 1856 he was elected a member of the Hanoverian parliament as a Liberal and an opponent of the government. He accepted the annexation of Hanover by Prussia without regret, and was one of the Hanoverians whose parliamentary abilities at once won a considerable following in the Prussian parliament, which he entered in 1867. For some reason—perhaps because Bismarck did not entirely trust him—he did not at this time attain quite so influential a position as might have been anticipated; nevertheless he was chairman of the parliamentary committee which in 1876 drafted the new rules of legal procedure, and he found scope for his great administrative abilities in the post of burgomaster of Osnabrück. He held this position from 1866 to 1870, and again from 1876 to 1879, being in the meantime (1870–1873) a director of the Disconto-gesellschaft. In 1870 he was elected burgomaster of Frankfurt-on-Main, where he gained a great reputation for the energy with which he dealt with social questions, especially that of the housing of the poor. Probably owing to his early study of socialism, he was very ready to support the new state socialism of Bismarck. He was the chief agent in the reorganization of the National Liberal party in 1887, in which year he entered the imperial Reichstag. After Bismarck's fall in 1890 he was chosen Prussian minister of finance, and held this post for ten years. He distinguished himself by his reform of the Prussian system of taxation, the one really successful measure of the new reign in internal affairs. An attempt, however, to reform the system of imperial finance in 1893–1894 failed, and much injured his reputation. Miquel had entirely given up his Liberalism, and aimed at practical measures for improving the condition of the people irrespective of the party programmes; yet some of his measures—such as that for taxing "Waarenhäuser" (stores)—were of a very injudicious nature. He professed to aim at a union of parties on the basis of the satisfaction of material interests, a policy to which the name of Sammlung was given; but his enemies accused him of constantly intriguing against the three chancellors under whom he served, and of himself attempting to secure the first place in the state. The sympathy which expressed the Agrarians increased his unpopularity among Liberals and industrials; but he pointed out that the state, which for half a century had done everything to help manufactures, might now attempt to support the failing industry of agriculture. In June 1901 the rejection of the canal bill led to a crisis, and he was obliged to send in his resignation. His health was already failing, and he died on the 8th of September, of the same year, at his home in Frankfort.

MIQUELETS (Miquelets of Miquelets) were irregular local troops in Catalonia who derived their name, it is said, from Miquel or Miquelot de Prats, a Catalan mercenary captain in the service of Cesare Borgia. They enjoyed a certain prominence in the minor wars of Spain during the 17th and 18th centuries, and in peace seem to have plundered travellers. In the War of the Spanish Succession (1701) the Miquelets continued the struggle against the French claimant until long after the peace. During the Peninsular War they were exceedingly successful in harassing the French invaders in the mountains of Catalonia. Sometimes they even attempted operations in large bodies, as in the operations round Gerona in 1808 and 1809. They were maintained by the several parishes, not by the central or the provincial governments, and as they had to turn out for duty on sound of the village alarm-bell (somatén) they are often called somatén.

MIRABEAU, ANDRÉ BONFACIUS LOUIS RIQUETI, VICOMTE DE (1754–1792), brother of the orator Mirabeau, was one of the reactionary leaders at the opening of the French Revolution. Sent to the army in Malta in 1776 he spent part of his two years there in prison for insulting a religious procession. During the War of American Independence he was in several sea-fights with the English, and was at the taking of Yorktown in 1781. In the following year he had two narrow escapes from drowning. In 1789, with his debts paid up by his father, he was elected by the noblesse of Limoges a deputy to the States General. He was a violent Conservative and opposed everything that threatened the old régime. His drunkenness produced a corpulence which brought him the nickname Mirabeau Tonneau ("Barrel Mirabeau"); but he was not lacking in some of that insight which marked his brother. He shared fully in the eccentric family pride; and boasted of his brother's genius even when bitter enemies held him. He emigrated about 1790, raised a legion which was to bear his name; but his insolence alienated the German princes, and his command was taken from him. He died in August 1792—of apoplexy or from a duel—in Freiburg im Breisgau. He wrote some verse as well as various pamphlets.

MIRABEAU, HONORÉ GABRIEL RIQUETI, COMTE DE (1740–1791), French statesman, was born at Bignon, near Nemours, on the 9th of March 1749. The family of Riqueti, or Riqueti, originally of the little town of Digne, won wealth as merchants at Marseilles, and in 1570 Jean Riqueti bought the château and seigniory of Mirabeau, which had belonged to the great Provençal family of Barres. In 1665 Honoré Riqueti obtained the title of marquis de Mirabeau. His son Jean Antoine served with distinction through all the later campaigns of the reign of Louis XIV., and especially distinguished himself in 1705 at the battle of Cassano, where he was so severely wounded in
the neck that he had ever after to wear a silver stock; yet he never rose above the rank of colonel, owing to an eccentric habit of speaking unpleasant truths to his superiors. On retiring from the service he married Françoise de Castellane, and left at his death, in 1737, three sons—Victor marquis de Mirabeau, Jean Antoine, bailli de Mirabeau, and Comte Louis Alexandre de Mirabeau. The great Mirabeau was the eldest surviving son of the marquess. When but three years old he had a virulent attack of small-pox which left his face disfigured, and contributed to his father's dislike of him. Being destined for the army, he was entered at a pension militaire at Paris. Of this school, which had Lagrange for its professor of mathematics, we have an amusing account in the life of Gilbert Elliot, 1st earl of Minto, who, with his brother Hugh, afterwards British minister at Berlin, there made the acquaintance of Mirabeau. On leaving this school in 1767 he received a commission in a cavalry regiment which his grandfather had commanded years before. He at once began love-making, and in spite of his ugliness succeeded in winning the heart of the lady to whom his colonel was attached; this led to such scandal that his father obtained a lettre de cachet, and the young scapegrace was imprisoned in the isle of Ré. The love affairs of Mirabeau form a well-known history, owing to the celebrity of the letters to Sophie. Yet it may be asserted that until the more durable and more reputable connexion with Mme de Nehra these love episodes were the most disgraceful blemishes in a life otherwise of a far higher moral character than has been commonly supposed. As to the marquess, his use of lettres de cachet is perfectly defensible on the theory of lettres de cachet, and Mirabeau, if any son, surely deserved such correction. Further, they had the effect of sobering the culprit, and the more creditable part of his life did not begin till he left Vincennes. Mirabeau did not develop his great qualities of mind and character until his youthful excesses were over, and it was not till 1781 that these began to appear. On being released, the young count obtained leave to accompany as a volunteer the French expedition to Corsica. After his return, he tried to keep on good terms with his father, and in 1772 he married a rich heiress, Marie Emille, daughter of the marquess de Marignane, an alliance procured for him by his father. His wild extravagance, however, forced his father to forestall his creditors by securing his detention in semi-exile in the country, where he wrote his earliest extant work, the Essai sur le despotisme. His violent disposition now led him to quarrel with a country gentleman who had insulted his sister, and his semi-exile was changed by lettre de cachet into imprisonment in the Château d'Exilles. In 1775 he was removed, however, to a more remote and lower castle, which was not very closely confined, having full leave to visit in the town of Pontarlier. Here he met Marie Thérèse de Monnier, his Sophie as he called her. Of his behaviour nothing too strong can be said: he was introduced into the house as a friend, and betrayed his trust by inducing Mme de Monnier to fall in love with him. The affair ended by his escaping to Switzerland, where Sophie joined him; they then went to Holland, where he lived by huck- work for the booksellers; meanwhile Mirabeau had been condemned to death at Pontarlier for râpé et vol, and in May 1777 he was seized by the French police, and imprisoned by a lettre de cachet in the castle of Vincennes.

During his imprisonment he seems to have learnt to control his passions from their very exhaustion, for the early part of his confinement is marked by the indecent letters to Sophie (first published in 1793), and the obscene Erotica biblion and Ma conversion, while to the later months belongs his political work of any value, the Lettres de cachet, published after his liberation (1782). It exhibits an accurate knowledge of French constitutional history skilfully applied in an attempt to show that an existing actual grievance was not only philosophically unjust but constitutionally illegal. It shows, though in a rather diffuse and declamatory form, that application of wide historical knowledge, keen philosophical perception, and genuine eloquence to a practical purpose which was the great characteristic of Mirabeau, both as a political thinker and as a statesman.

With his release from Vincennes (August 1782) begins the second period of Mirabeau's life. He found that his Sophie was an idealized version of a rather common and ill-educated woman, and she consorted with the affection of a young officer, after whose death she cards fritted suicide. Mirabeau first set to work to get the sentence of death still hanging over him reversed, and by his eloquence not only succeeded in this but got M. de Monnier condemned in the costs of the whole law proceedings. From Pontarlier he went to Aix, where he claimed the court's order that his wife should return to him. She naturally objected, but his eloquence would have won his case, even against Jean Etienne Marie Portalis, the leader of the Aix Bar, had he not in his excitement accused his wife of infidelity, on which the court pronounced a decree of separation. He then intervened in the suit pending between his father and mother before the parlement of Paris, and attacked the ruling powers so violently that he had to leave France and again go to Holland, and try to live by literary work. About this time began his connexion with Mme de Nehra, the daughter of Zwier van Haren, a Dutch statesman and political writer, and a woman of a far higher type than Sophie, more educated, more refined, and more capable of appreciating Mirabeau's good points. His life was strengthened by the love of his petite horde, Mme de Nehra, his adopted son, Lucas de Montigny, and his little dog Chico. After a period of work in Holland he betook himself to England, where he was received with the enthusiasm of the most ardent admirers, being translated into English in 1787, and where he was soon admitted into the best Whig literary and political society of London, through his old schoolfellow Gilbert Elliot, who had now inherited his father's baronetcy and estates, and become a leading Whig member of parliament. Of all his English friends none seem to have been so intimate with him as the 1st marquess of Lansdowne, better known as Lord Shelburne, and Mr. afterwards Sir Samuel, Romilly. The latter became particularly attached to him, and really understood his character; and it is strange that his remarks upon Mirabeau in the fragment of autobiography which he left, and Mirabeau's letters to him, should have been neglected by French writers. Romilly was introduced to Mirabeau by Sir Francis D'Ivernois (1757-1842), and readily undertook to translate into English the Considerations sur l'ordre de Cincinnatus, which Mirabeau had written in 1785. Romilly writes thus of him in his autobiography:-

"The count was difficult enough to please; he was sufficiently impressed by the beauties of the original. He went over every part of the translation with me, observed on every passage in which I was deficient, and corrected me. I have never seen a translation so well done. The expression was the most perfect, the ideas the most perspicacious, the style the most polished, and made many useful criticisms. During this occupation we had occasion to see one another often, and became very intimate; and, as he had read much, had seen a great deal of the world, was acquainted with all the most distinguished persons who at that time adorned either the royal court or the republic of letters in France; had a great knowledge of French and Italian literature, and possessed very good taste, his conversation was extremely interesting and not a little instructive. I had such frequent opportunities of seeing him at this time, and afterwards at a much more important period of his life, that I think his character was well known to me. I doubt whether it has been so well known to the world, and I am somewhat sorry that he has kept himself so much concealed. He was, indeed, not surprising, when one considers that, from the first moment of his entering upon the career of an author, he had been altogether indifferent as to how numerous or how powerful might be the enemies he should provoke. His vanity was certainly excessive; but I have no doubt that his vanity was far more his own than that of others. He was as scrupulous about the means by which those ends were to be accomplished. He indeed to some degree professed this; and more than once I have heard him say that there were occasions upon which he might feel that with such maxims as these in his mouth, unguarded in his expressions and careless of his reputation, he should have afforded room for the circulation of many stories to his disadvantage."

This luminous judgment, it must be noted, was written by a man of acknowledged purity of life, who admired Mirabeau in early life not when he was a statesman, but when he was only a struggling literary man. The Considerations sur l'ordre
Mirabeau, which Romilly translated was the only important work Mirabeau wrote in the year 1785, and it is a good specimen of his method. He had read a pamphlet published in America attacking the proposed order, which was to form a bond of association between the officers who had fought in the American War of Independence against England; the arguments struck him as true and valuable, so he re-arranged them in his own fashion, and rewrote them in his own oratorical style. He soon found such work not sufficiently remunerative to keep his petite horde in comfort, and then turned his thoughts to employment from the French foreign office, either in writing or in diplomacy. He first sent Mme de Nehra to Paris to make peace with the authorities, and then returned himself, hoping to get employment through an old literary collaborateur of his, Durival, who was at this time director of the finances of the department of foreign affairs. One of the functions of this official was to subsidize political pamphleteers, and Mirabeau hoped to be so employed, but he ruined his chances by a series of writings on financial questions. On his return to Paris he had become acquainted with Étienne Clavière, the Genevese exile, and a banker named Panchaud. From them he heard plenty of abuse of stock-jobbing, and seizing their ideas he began to regard stock-jobbing as an age hug, and the revenue, and attacked in his usual vehement style the Banque de St Charles and the Compagnie des Eaux. This last pamphlet brought him into a controversy with Caron de Beaumarchais, who certainly did not get the best of it, but it lost him any chance of literary employment from the government. However, his ability was too great to be neglected by a great minister such as Charles Gravier, Comte de Vergennes undoubtedly was, and after a preliminary tour to Berlin at the beginning of 1786 he was despatched in July 1786 on a secret mission to the court of Prussia, from which he returned in January 1787, and of which he gave a full account in his Histoire secrète de la cour de Berlin (1789). The months he spent at Berlin were important in the history of Prussia, for while he was there Frederick the Great died. The letters just mentioned show clearly what Mirabeau did and what he saw, and equally clearly how unfit he was to be a diplomatist. He certainly failed to conciliate the new king Frederick William; and thus ended Mirabeau's one attempt at diplomacy. During his journey he had made the acquaintance of Jakob Maulvillon (1743-1794), whom he found he had some great personal qualities and a great deal of energy, and he made use of him in a great work on Prussia published in 1788. But, though his De la monarchie prussienne sous Frédéric le Grand (London, 1788) gave him a general reputation for historical learning, he had in the same year lost a chance of political employment. He had offered himself as a candidate for the office of secretary to the Assembly of Notables which the king had just convened, and to bring his name before the public he published another financial work, the Dénonciation de l'agiotage, which abounded in such violent diatribes that he not only lost his election, but was obliged to retire to Tongres; and he further injured his prospects by publishing the reports he had sent in during his secret mission at Berlin. But 1787 was at hand; the states-general was summoned; Mirabeau's period of probation was over.

On hearing the king's determination to summon the states-general, Mirabeau started for Provence, and offered to assist at the preliminary conference of the noblesse of his district. They rejected him; he appealed to the tiers état, and was returned both for Aix and for Marseille. He elected to sit for the former city, for there he was present at the opening of the states-general, and at the quorum. The 4th of May 1789. From this time the record of Mirabeau's life forms the best history of the first two years of the Constituent Assembly, for at every important crisis his voice is to be heard, though his advice was not always followed. He possessed at the same time great logical acuteness and the most passionate enthusiasm. From the beginning he recognized that government exists in order that the bulk of the population may pursue their daily work in peace and quiet, and that for a government to be successful it must be strong. At the same time he thoroughly comprehended that for a government to be strong it must be in harmony with the wishes of the majority of the people. He had carefully studied the English constitution in England, and he hoped to establish in France a system similar in principle but without any slavish imitation of the details of the English constitution. In the first stage of the history of the states-general Mirabeau's part was very great. He was soon recognized as a leader, to the chagrin of Jean Joseph Mounier, because he always knew his own mind, and was prompt in emergencies. To him is to be attributed the successful consolidation of the National Assembly. When the taking of the Bastille had assured the success of the Revolution, he warned the Assembly of the futility of passing fine-sounding decrees and urged the necessity for acting. He declared that the famous night of the 4th of August was but an orgy, giving the people an immense theoretical liberty while not assisting them to practical freedom, and overthrowing the old régime before a new one could be constituted. His failure to control the theorizers showed Mirabeau, after the removal of the king and the Assembly to Paris, that his eloquence would not enable him to guide the Assembly by himself, and that he must therefore try to get some support. He wished to establish a strong ministry, which should be responsible like an English ministry, but to an assembly chosen to represent the people of France better than the English House of Commons at that time represented England. He first thought of becoming a minister at a very early date, if we may believe a story contained in the Mémoires of the duchesse d'Abrantes, to the effect that in May 1789 the queen tried to bribe him, but that he refused this and expressed his wish to be a minister. The indignation with which the queen repelled the idea may have made him think of the duke of Orleans as a possible constitutional king, because his title would of necessity be parliamentary. But the weakness of Orleans was too palpable, and in a famous remark Mirabeau expressed his utter contempt for him. He also attempted to form an alliance with Lafayette, but the general was as vain and as obstinate as Mirabeau himself, and had his own theories about a new French constitution. Mirabeau tried for a time, too, to act with Necker, and obtained the sanction of the Assembly to Necker's financial scheme, not because it was good, but because, as he said, "no other plan was before them, and something must be done."

Hitherto weight has been laid on the practical side of Mirabeau's political genius; his ideas with regard to the Revolution after the 5th and 6th of October must now be examined, and this can be done at length, thanks to the publication of Mirabeau's correspondence with the Comte de la Marck, a study of which is indispensable for any correct knowledge of the history of the Revolution between 1780 and 1791. Auguste Marie Raymon, prince d'Arenberg, known as the Comte de la Marck, was a Flemish nobleman who had been proprietary colonel of a German regiment in the service of France; he was a close friend of the queen, and had been elected a member of the states-general. His acquaintance with Mirabeau, begun in 1788, ripened during the following year into a friendship, which La Marck hoped to turn to the advantage of the court. After the events of the 5th and 6th of October he consulted Mirabeau as to what measures the king ought to take, and Mirabeau, delighted at the opportunity, drew up an admirable state paper, which was presented to the king by Monsieur, afterwards Louis XVIII. The whole of this Mémoire should be read to get an adequate idea of Mirabeau's genius for politics; here it must be summarized.

The main position is that the king is not free in Paris; he must therefore leave Paris and appoint a grand commissaire (one that has no post) to the king; he said to Necker, "Ce qui prend pour juge de sa conduite et de ses principes." He must then go towards the interior of France to a provincial capital, both of all to Rouen, and there he must appeal to the people and summon a great convention. It would be ruin to appeal to the noblesse, as the queen advised: "un corps de noblesse n'est point une armée, qui puisse combattre." When this great convention met the
king must show himself ready to recognize that great changes have taken place, that feudalism and absolutism have for ever disappeared, and that a new relation between king and people has arisen, which must be loyally observed on both sides for the future. It is certain, d’ailleurs, qu’il faut une grande révolution pour sauver le royaume, que la nation a des droits, qu’elle est en chemin de les recouvrer tous, et qu’il faut non seulement les rétablir, mais les consolider. Before this, constitution by position between king and people would not be difficult. But the “indissoluble monarque et du peuple est dans le cœur de tous les Français; il faut qu’elle existe dans l’action et le pouvoir.”

Such was Mirabeau’s programme, from which he never diverged, but which was far too statesmanlike to be understood by the poor king, and far too positive regarding the altered condition of the monarchy to be palatable to the queen. Mirabeau followed up his Mémorie by a scheme of a great ministry to contain all men of mark—Necker as prime minister, “to render him as powerless as he is incapable, and yet preserve his popularity for the king,” the duc de Liancourt, the duc de la Rochefoucauld, La Marck, Talleyrand, bishop of Autun, at the finances, Mirabeau without portfolio, G. J. B. Target, mayor of Paris, Lafayette generally to reform the army. Louis Philippe, comte de Ségur (foreign affairs), Mounier and I. R. G. le Chapelier. This scheme got noised abroad, and was ruined by a decree of the Assembly of the 7th of November 1789, that no member of the Assembly could become a minister; this decree destroyed any chance of that necessary harmony between the ministry and the majority of the representatives of the nation which existed in England, and so at once overthrew Mirabeau’s hopes. The queen utterly refused to take Mirabeau’s counsel, and La Marck left Paris. However, in April 1790 he was suddenly recalled by the comte de Mercy-Argenteau, the Austrian ambassador at Paris, and the queen’s most trusted political adviser, and from this time to Mirabeau’s death he became the medium of almost daily communications between the latter and the queen. Mirabeau at last attempted to make an alliance with Lafayette, but it was useless, for Lafayette was not a strong man himself and did not appreciate “la force” in others. From the month of May 1790 to his death in April 1791 Mirabeau remained in close and suspected, but not actually proved, connexion with the court, and drew up many admirable state papers for it. In return the court paid his debts; but it ought never to be said that he was bribed, for the gold of the court never made him swerve from his political principles—never, for instance, made him a royalist. He regarded himself as a minister, though an unwavowed one, and believed himself worthy of his hire.

Before Mirabeau’s influence on foreign policy is discussed, his behaviour on several important points must be noticed. On the question of the veto he took a practical view, and seeing that the royal power was already sufficiently weakened, declared for the king’s absolute veto and against the compromise of the suspensive veto. He knew from his English experiences that such a veto would be hardly ever used unless the king felt the people were on his side, and that if it were used unjustifiably the power of the purse possessed by the representatives of the people would, as in England in 1688, bring about a bloodless revolution. He saw also that much of the inefficiency of the Assembly arose from the inexperience of the members and their incurable verbosity; so, to establish some system of rules, he got his friend Romilly to draw up a detailed account of the rules and customs of the English House of Commons, which he translated into French, but which the Assembly, pulped up by a belief in its own impotence, refused to use. On this great subject of peace and war he supported the king’s authorisation and had some success. Again Mirabeau almost alone of the Assembly held that the soldier ceased to be a citizen when he became a soldier; he must submit to be deprived of his liberty to think and act, and must recognize that a soldier’s first duty is obedience. With such sentiments, it is no wonder that he approved of the vigorous conduct of François Claude Amour, marquis de Bouillé, at Nancy, which was the more to his credit as Bouillé was the one hope of the court influences opposed to him. Lastly,

in matters of finance he showed his wisdom: he attacked Necker’s “caisse d’escompte,” which was to have the whole control of the taxes, as absorbing the Assembly’s power of the purse; and he heartily approved of the system of assignats, but with the reservation that they should not be issued to the extent of more than one-half the value of the lands to be sold.

Of Mirabeau’s attitude with regard to foreign affairs it is necessary to speak in more detail. He held it to be just that the French people should conduct their Revolution as they would, and that no foreign nation had any right to interfere with them while they kept themselves strictly to their own affairs. But he knew also that neighbouring nations looked with unquiet eyes on the progress of affairs in France, that they feared the influence of the Revolution on their own peoples, and that foreign monarchs were being prayed by the French emigrés to interfere on behalf of the French monarchy. To prevent this interference, or rather to give no pretext for it, was his guiding thought as to foreign policy. He had been elected a member of the comité diplomatique of the Assembly in July 1790, and became its reporter at once, and in this capacity he was able to prevent the Assembly from doing much harm in regard to foreign affairs. He had long known Armand Marc, comte de Montmorin, the foreign secretary, and, as matters became more strained from the complications with the princes and counts of the empire, he entered into daily communication with the minister, advised him on every point, and, while dictating his policy, defended it in the Assembly. Mirabeau’s exertions in this respect are not his smallest title to the name of statesman; and how great a work he did is best proved by the confusion which ensued in this department after his death. For indeed in the beginning of 1791 his death was very near; and he knew it so well. The wild excesses of his youth and their terrible punishment had weakened his strong constitution and his parliamentary labours completed the work. So surely did he feel its approach that some time before the end he sent all his papers over to Sir Gilbert Elliot, who kept them under seal until claimed by Mirabeau’s executors. In March his illness was evidently gaining on him, to his great grief, because he knew that he alone could yet save France from the distrust of her monarch and the present reforms, and from the foreign interference, which would assuredly bring about catastrophes unparalleled in the history of the world. Every care that science could afford was given by his friend and physician, Cahans, to whose brochure on his last illness and death the reader may refer. The people kept the street in which he lay quiet; but with solicitude, the loving solicitude of friends, and the respect of all the people of France. When he could speak no more he wrote with a feeble hand the one word “dormir,” and on the 2nd of April 1791 he died.

No man ever so thoroughly used other men’s work, and yet made it all seem his own. “Je prends mon bien où je le trouve” is as true of him as of Molière. His literary work, except the bombastic but eloquent Essai sur le despoticisme (Neuhâel, 1775), was a translation of Robert Watson’s Philip II., done in Holland with the help of Dirus; his Considérations sur l’ordre de Cincinnati (London, 1788) was based on a pamphlet by Aedanus Boland (Dublin, 1782), on the most extravagant tendencies of the Society of the Cincinnati, and the notes to it were by Target; his financial writings were suggested by the Genevoise exile, Clavière. During the Revolution he received many visits and communications from foreign ambassadors and did not murmur because he absorbed all the credit and fame. Etienne Dumont, Clavière, Antoine Adrien Lamourette and Étienne Salomon Reybuz were but a few of the most distinguished of his collaborators. Dumont was a Genevoise exile, and an old friend of Romilly’s, who willingly prepared for him those famous addresses which Mirabeau used to make the Assembly pass by sudden bursts of eloquent declamation; Clavière helped him in these speeches, but only for the purpose of hearing his financial discourses; Lamourette wrote the speeches on the civil constitution of the clergy; Reybuz not only wrote for him his famous speech on the assignats, the organization of the national guard, and others, which Mirabeau read word for word. His political eloquence was not the occasional posthumous speech on succession to the estates of intestates, which Talleyrand read in the Assembly as the last work of his dead friend. Yet neither the gold of the court nor another man’s would make Mirabeau say what he did not himself believe, or do what he did not himself think right. He took
other men's labour as his due, and impressed their words, of
which he had suggested the ideas, with the stamp of
his own individuality; his collaborators themselves did not com-
plain—they were but too glad to be of help in the great work
of controlling and forwarding the French Revolution.
M. Mirabeau’s eloquence has been likened to that of both Bossuet and Vergniaud, but it had
never been the polish of the old 17th century bishop nor the flashes
of genius the young Girondin. It was rather parliamentary oratory in
its greatest thinker and orator, and a true republican force, and
people rather than Papists.

MIRABEAU—

MIRABEAU—MIRACLE

570

MIRABEAU, VICTOR RIQUETI, MARQUIS DE (1715-1780). French author and political economist, father of the great
Mirabeau, was born at Pertuis, near the old château de Mirabeau,
the 4th of October 1715. He was brought up very sternly
by his father, and in 1728 joined the regiment. He took keenly
to campaigning, but never rose above the rank of captain,
owing to his being unable to get leave at court to buy a regiment.
In 1737 he came into the family property on his father's death,
and spent some pleasant years till 1745 in literary companionship
with such authors as Voltaire, d’Alembert, and Volney, and
in the letters of Lebrun, and the poet Lefranc de Pomignan,
which might have continued had he not deter-
mained to marry—not for money, but for landed estates.
The lady whose property he fancied was Marie Gencâville, daughter
of a M. de Vassa, a brigadier in the army, and widow of the marquis
de Saulveboeuf, whom he married without previously seeing
her on the 21st of April 1743. While in garrison at Bordeaux
Mirabeau had made the acquaintance of Montesquieu, and after
retiring from the army he wrote his first work, his Testament Politique (1747),
which demanded for the prosperity of France a return of the French noblesse to their old position in
the middle ages.
This work was followed in 1750 by a book on the Utilité
des étofs provencials, which was attributed to Montesquieu
himself. In 1756 Mirabeau made his first appearance as a
political economist by the publication of his Lettres sur
la vie et la mort (1773), and in the same year he published the
Tractatus de populo. This work has been often attributed
to the influence, and in part even to the pen, of Quesnay,
founder of the economical school of the physiocrats, but
was really written before the marquis had made the acquaintance
of Madame de Pompadour. In 1760 he published his
Théorie de l'impôt, in which he attacked with all the
vehemence of his son the farmers-general of the taxes, who got
him imprisoned for eight days at Vincennes, and then exiled
to his country estate at Bignon. At Bignon the school of
the physiocrats was really established, and the marquis in 1765
bought the Journal de l'agriculture, du commerce, et des finances,
which became the organ of the school. He was recognized
as a leader of political thinkers by Prince Leopold of Tuscany,
afterwards emperor, and by Gustavus III. of Sweden, who
in 1772 sent him the grand cross of the order of Vasa. But
his marriage had not been happy; he had separated from his
wife in 1762, and had, he believed, secured her safely in
the provinces by a lettre de cachet, when in 1772 she suddenly
appeared in Paris, and commenced proceedings for a separation.
On account of his later days he has not taken this step.
He was determined to keep the case quiet, if possible, for
the sake of Mme de Paillé, a Swiss lady whom he had
loved since 1756. But his wife would not let him rest; her plea
was rejected in 1777, but she renewed her suit, and, though the
great Mirabeau had pleaded his father's case, was successful in 1781.
This trial quite broke the health of the marquis, as well as his
fortune; he sold his estate at Bignon, and hired a house at
Argenteuil, where he lived quietly till his death on the 11th
of July 1789.

The marquis's brother, JEAN ANTOINE RIQUETI,
"the balli" (d. 1794), served with distinction in the navy,
but his brusque manners made success at court impossible.
In 1763 he became general of the galleys of Malta. In 1767
he returned to France and took charge of the château de
Mirabeau, helping the marquis in his disastrous lawsuits.

et économiques, [thèse pour le doctorat] Paris (1901); Oncken, Der
erlaere Mirabeau und die ökonomische Gesellschaft in Bern, Berne,
1889; De Laveuve, Les Économistes français du 18° siècle.

MIRACLE (Lat. miraculum, from mirari, to wonder), anything
wonderful, beyond human power, and deviating from
the common action of the laws of nature, a supernatural event.
The term is particularly associated with the supernatural
factors in Christianity. To the Lat. miraculum correspond Gr. θαυμά
in the New Testament, and Heb. נאום (Exod. xv. 16; Dan. xii. 6) in the Old Testament. Other terms used in the New Testament are εναμαρτησις, "with reference to
the worker residing in the miracle worker" (cf. τραχ τ, Deut. iii. 24 and
Num. xvi. 30), and στήμ αναφέρεις "with reference to the source or claims of which it was the witness and guar-
antee" (cf. τραχ θ, Exod. iv. 8). The power is assumed to
be from God is shown by the phrases πνεύμα θεοῦ (Matt. xii. 28; cf. Luke iv. 18) and δακτύλιο θεοῦ (Luke xi. 20).

While Augustine describes miracles as "contra naturam quae
nobis est nota," Aquinas without qualification defines them as
"praeter naturam," supra et contra naturam." Lòscher affirms
in a recent article, "miracles are not qualifications of the
natural laws, but of a certain nature of the supernatural
vires tum contra naturae leges agere"; and Buddaues argues that
in them a "suspensio legum naturae" is followed by a
restitutio. Against the common view that miracles can attest the
truth of a revelation, the papal diplomacy of latter days
postulates probati oracula; and Höpfner returns to the qualified
position of Augustine when he describes them as "praeter et supra
naturam ordinem." The two conceptions, one common in the
Christian church, that on the one hand miracles involved an interference
deus ex machina, and on the other hand, as could be effected only by divine power,
they served as credentials of a divine revelation, are now generally
abandoned. As regards the first point, it is now generally held
that miracles are not primary proofs in the wide sense of the
common experience; and as regards the second, that miracles
are constituent elements in the divine revelation, deeds which display
the divine character and purpose; but they are signs and not merely symbols of truth. Some of the theories regarding miracles which have been formulated may be mentioned. Bonnet, Euler, Haller, Schmid and others suppose miracles to be already implanted in nature, and that they are the result of the intervention of the divine Spirit, as a sort of sheath, like hidden springs in a machine, and emerge into the light when their time comes. Similar is the view of Paracelsus and Jerome Cardan, who suppose a twofold world, existing one in the other; beside or behind the visible is an inner, invisible world, in which a divine Power is exercised, if he so chooses. These theories endeavour to discover the means by which the exceptional occurrence is brought about; but the explanation is merely hypothetical, and we are not helped in conceiving the mode of action. The question of the inner, what is called esoteric, is due to this the more do moral therapeutics rise in possibility and importance. The moral therapeutics consist in the influence of a powerful will over others. Harnack, however, has as yet failed to fasten a firm conviction of the intercession of one soul on another and of the soul on the body reach. Who can still affirm that all which in this realm appears as striking rests only on deception and error? Certainly no miracles occur, but there is enough of the same in the other law of nature. The divine agency is recognized as combining and controlling, but not as producing, in the teleological notion of miracles. "In miracles no new powers, instituted or stimulated by the divine creative action, are introduced into the order of nature; the manifold physical and spiritual powers in actual existence so blend together as to produce a startling result." The doctrine of Christ is the doctrine of the divine working in nature, rather than a particular miracle. The doctrine of the divine working in nature is in another passage more clearly defined. The closed circle of mechanical necessity is not immediately accessible to the miracle-working fiat, nor does it need to be; but the inner nature of that which obeys it is not determined by it but by the meaning of the world. This is the open place on which a power that commands in the name of this meaning can exert its influence; and if under this command the inner condition of the elements, the magnitudes of their relation to each other, and the causes of the mechanical condition of the world must unfold this new state into a miraculous appearance, not through suspension but through strict maintenance of its general laws. The doctrine of Evolution, instead of increasing the difficulty of conceiving the possibility of miracle, decreases it; for it presents to us the universe as an uncompleted process, and one in which the divine initiative and control of the phenomena is inseparable from the regularity of the phenomena, which are not comprehended contrary to the laws of nature. So for Schleiermacher "miracle is neither explicable from nature alone, nor entirely alien to it." What both Ritschl and Schleiermacher insist on is that the belief in miracles is inseparable from the belief in the divine Spirit, and that to this belief directing and controlling its existent forces, but also as initiating new stages consistent with the old in its progressive development. We may accept Dorner's definition as adequate and satisfactory. "Miracles are extraordinary events not contrary to the laws of nature, but for Schleiermacher "miracle is neither explicable from nature alone, nor entirely alien to it." What both Ritschl and Schleiermacher insist on is that the belief in miracles is inseparable from the belief in the divine Spirit, and that to this belief directing and controlling its existent forces, but also as initiating new stages consistent with the old in its progressive development. We may accept Dorner's definition as adequate and satisfactory. "Miracles are extraordinary events not contrary to the laws of nature, but contrary to the laws of nature, but contrary to the laws of nature, such as they are as real as they see it truly."

different, and utilizing them for its own purpose." (Life and Matter, p. 198). The theory of psychophysical parallelism recognizes that while there is a correspondence between mental and material phenomena, changes in the mind and changes in the brain, the latter are not by any means the same. William James distinguishes the transmissive function of the brain from the productive in relation to thought, and admits only the former, and not the latter (Human Nature, p. 326). If the human mind is to be treated as an active agent capable of performing miracles, it cannot be identical in body, and mind in brain, and both utilize their organs, so God, transcendent and immanent, uses the course of nature for His own ends; and the emergence both of life and mind in that course of nature would be such a divine initiative as is the recognition of the possibility of miracles. For such an initiative there must be adequate reason; it must be prepared for in the previous process, and it must be necessary to further progress. The miracle of the loaves and fishes is by no means inevitably to the inquiry regarding the necessity of miracle. The necessity of miracles is displayed in their connexion with the divine revelation; but this connexion may be conceived in two ways. The miracles may be regarded as the work of agents of divine revelation. It is an acknowledged historical fact, "says Butler, "that Christianity offered itself to the world, and demanded to be received, upon the allegation—i.e. as unbelievers would speak—upon the presence of miracles, publicly wrought to attest the truth of it, in such age, and that it was actually received by great numbers in that very age, and upon the professed belief of the reality of miracles" (Analogy, part ii, ch. vii.). This view is now generally abandoned, for it depends upon the strength of supernatural evidence, or, by adequate historical evidence, do not necessarily certify their divine origin. Their moral quality must correspond with the character of God; and as they must be connected with teaching which have been received as divine, they must also be connected with some special evidence of His personal greatness and majesty. The miracle of the loaves and fishes is the principle now generally recognized. The miracle and the doctrine mutually illuminate one another. "Les miracles discrètent la doctrine, et la doctrine diffuse le mérite des miracles." The supernatural and the credentials must also be constituents of the revelation. Of the miracles of Jesus, Bushnell says, "the character of Jesus is never shining with and through them, in clear self-evidence leaving them none to be told," but only "the glorious God" of its real character, with glory as tokens of a heavenly love, and acts that only suit the proportions of His personal greatness and majesty" (Nature and the Supernatural, p. 364). If it be asked why the character may not be discerned without the presence of miracles, it is answered, "Miracle is the certificate of identity between the Lord of Nature and the Lord of Conscience—the proof that He is a really moral being who subordinates physical to moral interests." (Life of the Mind, p. 73). As God is the Saviour, and the chief end of the revelation is redemption, it is fitting that the miracles should be acts of divine deliverance from physical evil. This concomitance of the miracle with truth and grace is the answer to the question of the signs given by the former or Huxley's about a certain trudging down to the Regent Street. The miracles of Jesus—the relief of need, the removal of suffering, the recovery of health and strength—reveal in outward events the essential features of the divine life, as the good deeds are revealed in the course of nature, but also by obscurely. The existence of physical evil, and still more of moral evil, forbids the assumption without qualification that the real is the rational. God works for the good of all, to what end? in his perfective purpose, of which these miracles are appropriate signs. It is an uninwarded idealism and optimism which finds the course of nature so wise and so good that any change in it may be regarded as injudicious. Of this, and sin it is impossible here to enter; but this must be insisted on, that the miracles of Jesus at least express divine benevolence just under those conditions in which the course of nature obscures it, and are therefore additional confirmations in a revelation of the divine will to that which it is impossible to give any account.

Having discussed the possibility and necessity of miracles for the divine revelation, we must now consider whether there is sufficient historical evidence for their occurrence. Historians who have written on the subject, when there is any available, can make a miracle credible. Mill states the position with due care. The question can be stated fairly as depending on a balance of evidence, a certain amount of positive evidence in favour of the miracles, and a certain amount of evidence against them. (Essays on Religion, p. 221). The existence of a certain amount of positive evidence in favour of miracles forbids the sweeping statement that miracles are contrary to the course of nature, but only that they have appeared, or are ambiguous. If mean all experience it assumes the point to be proved: if it means only common experience then it simply asserts that the miracle is unusual—a truism. The probability of miracles depends on the conditions which have of the free relation of God to nature, and of nature as the adequate organ for the fulfilment of God's purposes. If we believe in a divine revelation and redemption, transcending the course of nature, the miracles as signs of that divine purpose will not seem improbable.

For the Christian Church the miracles of Jesus are of primary importance; and the evidence—external and internal—in their favour may be said to be sufficient to justify belief. The Gospels assumed their present form between A.D. 60 and 90. Their repre-
and El ejemplo mayor de la desdicha—are respectively the sources of Rotrou's Don Bernardo de la Cabrede Belsaire; Moroeto's Caser para levantar is simply a recast of Mira's El Esclavo del demonio, a celebrated drama which clearly influenced Calderón when composing La Denuncia de la cruz; and there is manifestly a close relation between Mira's La Rueda de la fortuna on the one hand and Corneille's Héradis and Calderón's En esta vida todo es verdad y todo es mentira. A few of Mira de Ameucsa's plays are reprinted in the Biblioteca de autores españoles, vol. xiv.

**MIRAGE** (a French word, from mirer, to look at, se mirer, to be reflected), an optical illusion due to variations in the refractive index of the atmosphere. It embraces the phenomena of the visionary appearance of lakes in arid deserts, the images of ships and icebergs, frequently seen as if inverted and suspended in the atmosphere in the Polar Regions, the Fata Morgana, and "looming" as witnessed in mists or fogs.

In the article **REFRACTION** it is shown that a ray of light traversing a homogeneous medium is deviated from its rectilinear path when it enters a medium of different refractive index; it is therefore readily seen that the path of a ray through continuously varying media is necessarily curvilinear, being compounded of an infinite number of infinitesimally small rectilinear deviations. Our atmosphere is a medium of continuously varying refractive index. Meteorological optical phenomena, due to variations in the refractive index of the atmosphere, may be divided into groups: (1) those due to the permanent or normal variation experienced as one ascends in the atmosphere, and (2) those due to sporadic variations occasioned by irregular heating. The first variation must be taken into account in correcting geodetic observations of heights and astronomical observations of the heavenly bodies; it also has a considerable bearing on the phenomena of the twilight and the afterglow (see **REFRACTION**: § *Astronomical*; and **TWILIGHT*). The second (or temperature) variation gives rise to phenomena which we proceed to discuss.

A common type of mirage is the appearance of an isolated lake, frequently seen in hot sandy deserts, as in the Sahara, Turkistan, &c. The explanation is as follows: The land, being abnormally heated by the solar rays, causes the neighbouring air to expand, consequently its density, and therefore its refractive index, is diminished, and attains a minimum value in the lowest layers. It increases as we ascend and reaches a maximum at a certain height, and then decreases according to the normal variation. Any object viewed across such an area is seen by two sets of rays: one set passing near the earth and assuming a curved path convex to the horizon, the second set more remote from the earth and concave to the horizon. The object thus appears double, an image being seen mirrored in the sand. The sky appears as a shining lake; mountains or palms may be similarly reflected, but it is to be noted that the images are inverted (see fig.). Similar atmospheric conditions sometimes prevail in the air over large bodies of water, where the sky is clear and the air cold. In cold autumn mornings these phenomena have been experimentally realized by R. W. Wood (*Phil. Mag.*, 1899, vol. xlvii.), who viewed objects over a series of heated slate slabs.

Another type of mirage, frequently observed at sea in the northern latitudes, is presented in the appearance of ships and icebergs as if inverted and suspended in the clouds. This is due to a stratum of hot air at some distance above the sea level, the rays of light near the horizon being practically horizontal, while those at greater elevations are fairly concave. It may happen that the change in density is so great that only the upper rays reach the eye; we are then met with the curious illusion of seeing inverted ships in the clouds, although nothing is visible on the ocean.

The Fata Morgana, frequently seen in the Straits of Messina, consists of an apparent vertical elongation of an object situated on the opposite shore. The distribution of density is similar to that attending a desert mirage, but the transition is not so abrupt. The object is really viewed through a horizontally stratified medium consisting of a central sheet of maximum refractive index, over- and under-laid by sheets of decreasing refractive power. The sheet consequently acts as a continuous lens, magnifying the object in a vertical direction.

If, in addition to this horizontal stratification, the atmosphere varies similarly in vertical planes, then the object would be magnified both horizontally and vertically. These conditions sometimes prevail in misty or foggy weather, more particularly at sea, and thus give rise to the phenomena known as "looming." A famous example is the Brockenspeck or "spectre of the Brocken." The chromatic halos which frequently encircle these images are due to diffraction. (See **CORONA**.)

It is interesting to note that lenses formed on non-homogeneous material, having the maximum refractive index along the central axis, have been prepared, and reproduce the effects caused by abnormal distribution of the density of the atmosphere.

The mathematical investigation of this subject was worked out by Gaspard Monge. For this aspect and further details, both descriptive and experimental, see J. F. Pretner, *Meteorologische Optik* (1906); E. Mascart, *Traité d'optique* (1899-1903); R. W. Wood, *Physical Optics* (1905); R. S. Heath, *Geometrical Optics*.

**MIRAJ**, a native state of India, in the Deccan division of Bombay, forming part of the southern Maharatta Jagirs. Since 1820 it has been subdivided between a senior and a junior branch. The territory of both is widely scattered among other native states and British districts. Area of the senior branch, 339 sq. m.; pop. (1901), 81,457; revenue £23,000; tribute £800. Area of the junior branch, 211 sq. m.; pop. (1901), 53,806; revenue £17,000, tribute £400. The chiefs are Brahmans of the Patwardhan family. The town of Miraj, at which the chief of the senior branch resides, is situated near the river Kistna; it is a junction of the Southern Maharatta railway for the branch to Kolhapur. Pop. (1901), 18,425. The chief of the junior branch has his residence at Bhudgao (pop. 3597).

**MIGUEL, MIGUEL** (1832-1867), Mexican soldier of French extraction, was born in the city of Mexico, on the 30th of September 1832, and shot with the Emperor Maximilian at Queretaro on the 19th of June 1867. While still a student he helped to defend the military academy at Chapultepec against the forces of the United States; and, entering the army in 1852, he rapidly came to the front during the civil wars. It was largely due to Miramon's support of the ecclesiastical party against Alvarez and Comonfort that Zuloaga was raised to the presidency; and in 1859 he was called to succeed him in that office. Decisively beaten by the Liberals in 1860, he spent some time in Europe advocating foreign intervention in Mexican affairs; and returned as a partisan of Maximilian. His ability as a soldier was shown by his double defence of Puebla in 1856.

**MIRANDA, FRANCESCO** (c. 1734-1820), Spanish-American soldier and adventurer, was born at Caracas, Venezuela, about 1754. He entered the army, and served with the French in the American War of Independence. The success of that war inspired him with a belief that the independence of Spanish America would increase its prosperity. He began to scheme a revolution, but was discovered and had only just time to escape to the United States. Thence he went to England, where he was introduced to Pitt, but chiefly lived with the leading members of the opposition—Fox, Sheridan and Romilly. Finding no help, he travelled through Austria and Turkey to Russia, where he was warmly received, but was dismissed with rich presents, at the demand of the Spanish ambassador, backed up by France.

The news of the dispute between England and Spain about Nootka Sound in 1790 recalled him to England, where he saw a good deal of Pitt, but the peaceful arrangement of the dispute again destroyed his hopes. In April 1792 he went to Paris, with introductions to Pétion and the leading Girondists, hoping for aid in South America. France had too much to do to help others; but Miranda's friends sent him to the front as general of brigade. He distinguished himself under Dumouriez, was entrusted in February 1793 with the siege of Maestricht, and commanded the left wing of the French army at the disastrous
MIRANDA, a town of south-western France, capital of an arrondissement in the department of Gers, on the left bank of the Grande Baise, 17 m. S.S.W. of Auch by the Southern railway. Pop. (1906), 23,698. Miranda is laid out on the uniform plan typical of the bastide. Its church, built at the beginning of the 15th century, is chiefly remarkable for its porch which precedes the Rue de l'Évêché and is surmounted by two flying buttresses supporting a belfry of Flemish appearance. The remains of ramparts are still to be seen and the principal street is bordered by ancient arcades. The town is equipped with a market-place. The trade is in live-stock and agricultural products. Tanning and wood-turning are carried on.

Miranda was founded in 1286 by the monks of Berdones and the seneschal of Toulouse acting on behalf of Philip IV. During the 14th century it was the capital of the counts of Astarac.

MIRANDOLA, a town of Emilia, Italy, in the province of Modena, 13 m. by E. of it by rail, 59 ft. above sea-level. Pop. (1901), 15,162. The Palazzo del Commune is a 15th-century edifice of Gothic style. The castle of the Pico family, who held the town from the 14th century to 1710, when the last member was deprived of his dominions by Joseph I. of Austria, is almost entirely destroyed. The height of the fortresses of this family was from about 1430 to 1530. Giovanni (b. 1433, d. 1494) being its ablest and most learned member (see Prco). The cathedral, dating from the end of the 16th century, has been restored by S. Francesco is a fine Gothic church.

MIRANZAI VALLEY, or HANGU, a mountain valley on the Kohat border of the North-West Frontier Province of India. Miranasi comprises two valleys draining S.W. into the Kunan and N.E. into the Kohat Toli. It is thus divided into upper and lower Miranasi, and extends from Thal to Raisan, and from the Zaimukt and Orakzai hills to those of the Khattaks. Its length is about 40 m., and its breadth varies from 3 to 7 m. Area, 546 sq. m.; pop. (1901), 43,901. The portion of Miranasi east of Hangu village consists of numerous small and well-cultivated valleys, in which orchard trees flourish abundantly. To the west of Hangu, including the whole of Upper Miranasi, the country is a broad, open, breezy valley. The plain is bare of trees, but the hills are generally covered with scrub. The country is full of ravines towards Thal. The wealth of the inhabitants consists principally in cattle, goats and sheep; of these the cattle are of a lean and dwarf breed, and give but little milk. Miranasi forms the meeting place of many different tribes; but its chief inhabitants are the Bangash and Orakzai. Disturbances have necessitated British expeditions in 1851, 1855, and twice in 1891.

MIRBEAU, OCTAVE HENRI MARIE (1852-1917), French dramatist and journalist, was born at Trevieres (Calvados) on the 16th of February 1852. He was educated inler J. Roux, and studied in Paris. He began his journalistic career as dramatic critic of the Bonapartist paper, L'Ordre. For a short time before 1877 he was sous-préfet of Saint-Girons, but from that time he devoted himself to literature. He was one of the earliest defenders of the Impressionist painters. His witty articles in the anti-republican papers, and his attacks on established reputations, involved him in more than one duel. He gradually developed extreme individualist views. In 1890 he began to write for the Révolte, but his anarchist sympathies were definitely checked by the murder of President Carnot in 1894. He was one of the early and consistent defenders of Captain Alfred Dreyfus. He married in 1887 the actress Alice Regnault. His first novel, Jean Marcellin (1885), attracted little attention, but he made his mark as a conteur with a series of tales of the Norman peasantry, Lettres de ma chaumière (1886). Le Calvou (1887), a chapter of which on the defeat of 1797 aroused much discussion, was followed by L'Abbé Jules (1888), the story of a mad priest; by Sébastien Roch (1890), a bitter picture of the Jesuit school in which his own early years were spent; Le Jardin des supplices (1890), a Chinese story; Les Misérables (1891); and Les Vingtième journées d'un neurasthenique (1902). In 1897 his five-act piece, Les Mauvais Berger, was played at the Renaissance by Sarah Bernhardt, and he followed this up with Les Affaires sont les affaires (Théâtre Français, 1903), which was adapted by Sydney Grundy for Sir H. Beerbohm Tree in 1905. Some of his short pieces are collected as Farces et moralités (1904).

MIRFIELD, an urban district in the Morley parliamentary division of the West Riding of Yorkshire, England, 3 m. S.W. of Dewsbury, on the Lancashire & Yorkshire and London & North-Western railways. Pop. (1901), 11,341. The church of St Mary was completed in 1874, from designs of Sir Gilbert Scott. The tower of the ancient church remains. The large industrial population is employed in woollen, cotton, carpet and blanket manufactures, and in the numerous collieries in the vicinity.

MIRKHOND (1433-1498). Mohammed bin Khawandshah bin Mahmud, commonly called Mirkhwand or Mirkhaward, more familiar to Europeans under the name of Mirkhond, was born in 1433, the son of a very pious and learned man who, although belonging to an old Bokhara family of Suyyids, or direct descendants of the Prophet, lived and died in Balkh. From his early youth he applied himself to historical studies and literature in general. In Herat, where he spent the greater part of his life, he gained the favour of that famous patron of letters, Mir 'Ali Shishir (1490-1501), who served his old schoolfellow, the reigning sultan Husain (who as the last of the Timurides in Persia ascended the throne of Herat in 1468), first as keeper of the seal, afterwards as governor of Jurjan. At the request of
Mr 'Allahshu, himself a distinguished statesman and writer, Mirkhond began about 1474, in the quiet convent of Khiššāya, which his patron had founded in Herāt as a house of retreat for literary men of merit, his great work on universal history, Raušat-üssafa fi sirat-ulānba or 'Garden of Purity' (Persian) (1879), or Raušat-üssafa fi sirat-ulānba or 'Garden of Purity on the Biography of Prophets, Kings and Caliphs.

He made an attempt to correct the critical examination of historical traditions, and to explain the history of the world as being a flowery and often bombastic style, but in spite of this drawback, Mirkhond's Raušat remains one of the most marvellous achievements in literature. It comprises seven large volumes and a geographical appendix; but the seventh volume, the history of the sultan Husain (1438-1503), together with a short account of some later events down to 1523, cannot have been written by Mirkhond himself, who died in 1498. He may have compiled the preface, but the main portion of this volume is probably the work of his grandson, the historian Khvāndamīr (1475-1534), to whom also a part of the appendix must be ascribed.

MIRRORS

Miroir (through O. Fr. miroir, mod. miroir, from a supposed Late Lat. miroarium, from mirari, to admire), an optical instrument which produces images of objects by reflection. In its usual forms it is simply a highly polished sheet of metal or of glass (which may or may not be covered, either behind or before, with a metallic film); a metallic mirror is usually termed a speculum. The laws relating to the optical properties of mirrors are treated in the article REFLECTION OF LIGHT.

Ancient Mirrors.—The mirror (κατστροφ, κατστροφ, κατστροφ, speculum) of the Etruscans, Greeks and Romans consisted of a thin disk of metal (usually bronze) slightly convex and polished on one side, the other being left plain or having a design incised upon it. A manufactory of mirrors of glass at Sidon is mentioned by Pliny (Nat. Hist. xxxvi. 66, 193), but they appear to have been little used (one has been found at San Remo). Glass mirrors were coated, but with tin; some silver mirrors have also been found. They are said to have been in use as early as the time of Pompey, and were common under the empire. Homer knows nothing of mirrors, but they are frequently mentioned in the tragedians and onwards. The usual size was that of an ordinary hand-mirror, but in imperial times some appear to have been large enough to take in the whole figure (Seneca, Nat. quaest., 1. 17, 8), being either fixed to the wall or working up and down like a window sash. The first specimen of a Greek mirror was not discovered till 1867, at Corinth, and the number extant is comparatively small. They are usually provided with a handle, which sometimes took the form of a statuette (especially of Aphrodite) supported on a pedestal, or consist of two metallic disks (the "box" mirrors) fitting in to each other, and sometimes fastened together by a hinge. The upper disk or cover was ornamented on the outside with a design in low relief; inside it was polished to reflect the face. The lower disk was decorated inside with engraved figures. The best specimens of both kinds of mirrors date from a little before 400 B.C. and last for some time after that. Of the reliefs, one of the best examples is "Ganymede carried away by the eagle"; amongst the incised mirrors may be mentioned one representing Leuca and Corinth, inscribed with their names (both the above in Collignon, L'Archéologie grecque, 1907, figs. 212, 213); the Genius of the Cock-fights (Revue archéologique, new ser. xvi., 1868, Pl. 13). A bronze mirror-case, found at Corinth, has attached on the outside a relief representing an Eros with two girls; on the inside is incised a design of a nymph seated on a bench and playing with Pan at a game resembling the Italian mora (Classical Review, Feb. 1889, p. 86). On the back of another mirror in the British Museum (Gazette archéologique, ii. Pl. 27) is a figure of Eros which has been silvered over. With this was found the bronze case used to contain it, on the back of which is a group of Aphrodite and Eros in repoussé. It was found in Crete; but most of the Greek mirrors and mirror-cases having designs are from Corinth.

The principal feature of the Etruscan mirrors, the extant examples of which far outnumber the Greek, is the design incised on the back. Belonging chiefly to the 4th and 3rd centuries, they mostly resemble the Greek disk-mirrors in form, box-mirrors being rare. As a rule the subjects incised are taken from Greek mythology and legend (Troyan War, birth of Athena, Aphrodite and Adonis), the names of the persons represented being frequently added in Etruscan letters and orthography (Apôl = Apollo, Achiî = Achilles, Achmun = Agamemnon). Scenes from daily life, the toilet, the bath, the palaestra, also occur. In most cases the style of drawing, the types of the figures, and the manner of composing the groups are true to the characteristics of Greek art. Some may have been imported from Greece, but the greater number appears to have been more or less faithfully imitated from such designs as occurred on the Greek vases which the Etruscans obtained from Greece. Even where distinctly Etruscan figures are introduced, such as the heroes Aeneas and Caelius Vibenna on a mirror in the British Museum, Greek models are followed. Although the work is frequently rough and careless, certain very fine and beautiful specimens have been found in the famous Etruscan tombs (the healing of Telephus, in which Achilles is shown scraping the hero's rust from the lance with a crescent-shaped knife (Baumeister, Denkmäller, figs. 557, 1774). Roman mirrors are usually disk-mirrors, the back of the disk, if engraved, being generally ornamented with decorative patterns, not with any subject design.

Plain mirrors are found wherever Greek and Roman civilization spread, and a specimen found in Cornwall (now in the British Museum) shows that the Celtic population of England had adopted the form and substance of the mirror from their conquerors. This specimen is enriched with a Celtic pattern incised. The shape of the handle exhibits native originality. Mirrors were sometimes used in Greece for purposes of divination (Pausanias vii. 21, 5). The mirror was let down into a well by means of a string until it grazed the surface of the water with the rim; after a little while it was pulled up, and when looked into showed the face of the sick person, alive or dead, on whose behalf the ceremony had been performed. This took place at Patrae.

MIRROR

Medieval and Modern Mirrors.—Small metallic mirrors with a highly polished surface were largely used during the middle ages: pocket mirrors or small hand mirrors carried at the girdle being indispensable adjuncts to ladies' toilets. The pocket mirrors consisted of small circular plaques of polished metal, usually steel or silver, fixed in a shallow circular box covered with a lid. Mirror-cases were chiefly made of ivory, carved with relief representations of love or domestic scenes, hunting and games, and sometimes illustrations of popular poetry or romance. Gold and silver, enamels, ebony and other costly materials were likewise used for mirror cases, on which were lavished the highest decorative efforts of art workmanship and costly jewelling. The mirrors worn at the girdle had no cover, but were furnished with a short handle. In 625 Pope Boniface IV. sent Queen Ethelberga of Northumbria a present of a silver mirror; and in early Anglo-Saxon times mirrors were well known in England. It is a remarkable fact that on many of the sculptured stones of Scotland, belonging probably to the 7th, 8th and 9th century, representations of mirrors, mirror-cases and combs occur.

The method of backing glass with thin sheets of metal for mirrors was well known in the middle ages; a time when steel and silver mirrors were not exclusively employed. Vincent de Beauvais, writing about 1230, says that the mirror of glass and lead is the best of all, “quia vitrum propter transparentiam melius recipit radios”; and a verre à mir is mentioned in the inventories of the dukes of Burgundy, dating from the 15th century. A gilt of glass-mirror makers existed at Nuremberg in 1373, and small convex mirrors were commonly made in southern Germany before the beginning of the 15th century; and these continued to be in demand, under the name of bull’s-eyes (Ochsen-Augen), till comparatively modern times. They were made by blowing small globes of glass into which while still hot was pressed through the pipe a mixture of tin, antimony and resin or tar. When the globe was entirely coated with the metallic compound and cooled it was cut into convex lenses, which formed small but well-defined images. As early as 1317 a “Magister de Alemania,” who knew how to work glass for mirrors, broke an agreement he had made to instruct three Venetians, leaving in their hands a large quantity of mixed alum and soot for which they could find no use. It was, however, in Venice that the making of glass mirrors was a commercial success. First developed in and the republican era and extinguished privileged monopoly of the manufacture for about a century and a half. In 1507 two inhabitants of Murano, representing that they possessed the secret of making perfect mirrors of glass, a knowledge hitherto confined to one German glass-house, obtained an exclusive privilege of manufacturing mirrors for a period of twenty years. In 1564 the mirror-makers of Venice, who enjoyed peculiar privileges, formed themselves into a corporation. The products of the Murano glass-houses quickly supplanted the mirrors of polished metal, and a large and lucrative trade in Venetian glass mirrors sprang up. They were made from blown cylinders of glass, which were slit, flattened on a stone, carefully polished, the edges frequently bevelled, and the backs “silvered” by an amalgam. The glass was remarkably pure and uniform, the “silvering” bright, and the sheets sometimes of considerable dimensions. In the inventory of his effects, made on the death of the French minister Colbert, a Venetian mirror, 4½ by 26 in., in a silver frame, is valued at 8016 livres, while a picture by Raphael is put down at 3000 livres.

The manufacture of glass mirrors, with the aid of Italian workshops, was carried on in England in the 17th century, and about 1670 the duke of Buckingham was concerned in glass-works at Lambeth where plain glass was made for looking-glasses. These old English mirrors, with bevelled edges in the Venetian fashion, are still well known. The Venetians guarded with the utmost jealousy the secrets of their manufactures, and gave exceptional privileges to those engaged in such industries. By their statutes any glass-maker carrying his art into a foreign state was ordered to return on the pain of imprisonment of his nearest relatives, and should disobey the command emissaries were delegated to slay him. In face of such a statute Colbert attempted in 1664 to get Venetian artists to France to develop the two great industries of mirror-making and point-work. The ambassador, or, the bishop of Béziers, pointed out that this was to court the risk of being thrown into the Adriatic, and, further, that Venice was selling to France mirrors to the value of 100,000 crowns and lace to three or four times that value. Nevertheless, twenty Venetian glass-mirror makers were sent to France in 1665, and the manufacture was begun in the Faubourg St Antoine, Paris. But previous to this the art of blowing glass for mirrors had been practised at Tour-la-Ville, near Cherbourg, by Richard Lucas, Sieur de Nehou, in 1633; and by the subsequent combination of skill of both establishments French mirrors soon excelled in quality those of Venice. The art received a new impulse in France on the introduction of the making of plate glass in 1691. The St Gobain Glass Company attribute the discovery to Louis Lucas of Nehou, and over the door of the chapel of St Gobain they have placed an inscription in memory of “Louis Lucas qui inventa en 1691 le méthode de couler les glaces et installa la manufacture en 1695 dans le château de Saint Gobain.”

Manufacture.—The term “silvering,” as applied to the formation of a metallic coating on glass for giving it the properties of a mirror, was till the end of the 15th century a trade secret. In 1627, however, by a simple process, a tin amalgam, was used in the process. Now, however, a large proportion of mirrors are made by depositing on the glass a coating of pure silver, and the old amalgamation process is comparatively little used. A mixture of silver, and a small proportion of amalgam of tin and mercury to the surface of glass. A sheet of thin tin-foil, somewhat larger than the glass to be operated on, is spread out on a flat table, and after all folds and creases have been completely removed, the whole plate is quickly spread out over the whole surface, and the scum of dust, impure tin and mercury is taken off. Mercury is then poured upon the “quickened” foil until there is a body of it sufficient to float the glass to be silvered (also in due course, and this plate cleaned simultaneously with the above operations) is slid over the glass in a hot amalgam of tin and mercury.

Weights are placed over the surface until the greater part of the amalgamated mercury is pressed out, and the table is then tilted till all superfluous mercury finds its way to the gutter. The glass is left twenty-four hours to dry in this position; it is then turned over, the silvered side up and removed to a drain, where it dries and hardens. This process, when elaborated, yields excellent results, producing a brilliant silver-white metallic lustre, which is only subject to alteration by exposure to high temperatures or by contact with damp surfaces; but the mercurial vapours to which the workmen are exposed give rise to the most distressing and fatal affections.

The silver on glass mirror may be regarded as a discovery of J. L. Lescarbault (1627) who, in 1630, applied a mixture with an ammoniacal solution of silver nitrate in a glass vessel a brilliant deposit of metallic silver was formed on the surface of the glass. In practice the process was introduced about 1840; and it is now carried on with the most complete success. In the hot bath and the cold process respectively. In the former method there is employed a horizontal double-bottomed metallic metal, which is heated with steam to from 35° to 40° C., and the reduction of the ammoniacal silver solution is effected with tartaric acid.

In silvering by the cold process advantage is taken of the power of sugar to reduce the silver nitrate. This method has been generally adopted for the silvering of mirrors for astronomical telescopes.

C. L. Ritchey ("The Modern Reflecting Telescope," Smithsonian Contributions to Knowledge, National Academy of Sciences, 1884.) states that the glass disk is mounted on a rocking-table, and most carefully cleaned with nitric acid, potash, and finally with distilled water. The reducing solution (which improves on keeping) is made by dissolving silver in concentrated solution of nitric acid and 1 of nitric acid (commercial pure). The silver solution is prepared as follows: 2 parts of silver nitrate are dissolved in 20 parts of water, and strong ammonia added until the brown solution becomes clear. A solution of 2 parts of nitric acid and 1 part of water, is now added, and then ammonia until the solution is again clear. A solution of 4 part of silver nitrate in 16 of water is added until the liquid is straw-coloured; it is then filtered. Quantities of the solution are placed in the hot bath, then further diluted, mixed, and poured on to the plate, which is gently rocked. The liquid goes muddy-brown, and in 3 to 4 minutes it begins to clear, a thick deposit being formed in about 5 minutes. The solution is then cooled off, and milliners in the district was precipitate water removed by lightly held cotton wool. The washing is repeated, and then water is allowed to remain on the film for one hour. The water is then run off, and the plate is washed several times with alcohol, and then dried by an air fan. The film is now burnished with a leather pad, and finally with the jeweller's rouge, the silver surface being the reflecting surface of the mirror.
The deposit of silver on glass is not so adherent and unalterable under the influence of sunlight and sulphurous fumes as the tin-mercury amalgam, and, moreover, real silvered glass has in many cases a slightly yellowish tinge. These defects have been overcome by a process introduced by Lemont, which consists of polishing the silvered surface with a dilute solution of cyanide of mercury, which, instantaneously forming a kind of amalgam, renders the deposit at once much whiter and more firmly adherent than before. To prevent losses by filth and stains, the film of amalgam is removed after the chemical action of gases and vapours it is coated with shellac or copal varnish, over which, when dry, are applied two coatings of red-lead paint or an electrolytically-deposited film of copper. This precaution only applies when the silver forms the back of the mirror.

**Platinum Mirrors.**—A cheap process of preparing mirror glass was to some extent prosecuted in France, whereby a thin but very adherent deposit of platinum is formed on the glass. This is produced by the chlorid of palladium, with a proportion of litharge and borate of lead dissolved in essential oil of spike is applied with a brush to well-cleaned glass, which is then placed on edge in a muffe furnace, and the platinum is thus burned in, forming an exceedingly thin but brilliant metallic film. It was used only for the lids of cheap boxes, toys, ornamental letters, &c.

**Magic Mirrors.**—Hand mirrors of metal are still in use in Oriental countries, and in Japan bronze mirrors possess a religious significance. Among the former we know little of the mirror made of brass, which is the most important mirror used in the East. It is formed by the use of the sun's rays, and is used even in the palaces of kings. The mirror is frequently referred to in the songs of poets. It is a sacred instrument and is used in the worship of the gods. It is also used by the women in the East for the purpose of looking at themselves. It is used in the manufacture of mirrors and is called the mirror of the gods.

from felony in character or in the mode of punishment that, in the absence of a code, no logical line of division can now be drawn, inasmuch as few felonies are now capital and none involve the forfeitures of land or goods, which at one time endorsed an appreciable distinction between the two categories of crime. The result is that it is impossible to distinguish without enumerating the specific crimes falling under each head.

Among the chief misdemeanours are: (1) Assault on the sovereign; (2) unlawful assembly; (3) riot and sedition; (4) forcible entries; (5) perjury, which until 1563 was mainly, if not solely, cognizable by the spiritual courts; (6) blasphemy; (7) extortion; (8) bribery; (9) obtaining property by false pretences (which is nearly cognate to the felony of larceny); (10) assault; (11) public nuisance; (12) libel; (13) conspiracy to defraud, &c.; (14) attempts to commit other crimes.

Numerous acts or omissions are punishable as "misdemeanours by interpretation." In other words, disobedience to the command or prohibition of a statute as to a matter of public concern is indictable as a misdemeanour, even if the statute does not so describe it, unless the terms of the statute indicate that some other remedy alone is to be pursued. For some misdemeanours penal servitude may be imposed by statute. But as a rule the punishment is by fine or imprisonment without hard labour or both, at the discretion of the court unless limited by a particular statute. The offender may also be put under recognizance to keep the peace and be of good behaviour. Theoretically, whipping may be imposed; but this is now done except under specific statutory authority: and the like authority is necessary to authorize the addition of hard labour to a sentence of imprisonment.

At the present time the practical difference in English law between misdemeanour and felony lies in matters of procedure, in which a trial for misdemeanour closely resembles an ordinary civil trial.

1. An arrest for misdemeanour may be made without judicial authority except under special statutory authority.
2. A person charged with misdemeanour is entitled to bail (see Arrest), i.e. to release on the obtaining of sureties, or even on his own recognizance without sureties to appear and take his trial. Bail is obligatory in all misdemeanours, with the exception of misdemeanours where the costs of the prosecution are payable out of the county or borough rate fund.
3. A misdemeanour may be tried on an information filed by the attorney-general or by leave of the high court without the indictment essential in felonies and felonies by information.
4. The same indictment or information may include a number of charges of misdemeanour committed at different times and even against different persons. See Indictment.
5. A trial for misdemeanour may proceed in the absence of the defendant, who is not "given in charge" to the jury, as in the case of felony.
6. On a charge of misdemeanour a trial by special jury may be ordered.
7. There is no right to challenge peremptorily any of the jurors summoned to try the case; any challenge made must be for cause. The jury is sworn collectively (four men to a book), and not poll by poll as in felony, and their oath is to try the issues joined between the king and the defendant. They may separate during adjournments of the trial, like a jury in a civil case.
8. The costs of prosecuting certain misdemeanours are recoverable out of public funds under specific statutory provisions; but in very few cases is the court entitled to recover the misdemeanant himself pay them.
9. There are no accessories after the fact to misdemeanour. (See Accessory.)

Under French law and systems based thereon or having a common origin a distinction is drawn between crime (verbrechen), délits (vergehen) and contravention. The English term misdemeanour roughly corresponds to the two classes of délits and contravention but includes some offences which would be qualified as "crime." In the criminal code of Queensland the term "misdemeanour" is retained, while that of "felony" is abolished; and offences are classified as crimes, misdemeanours and simple offences, the two former punishable on indictment, the latter on summary conviction only; the more serious offences described in English law as misdemeanours are in that code described as crimes (e.g. perjury). In the United States the English common law as to misdemeanour is generally followed, but in New York and other states a statutory distinction has been made between misdemeanour and felony by defining the latter as a crime punishable by death or by imprisonment in a state prison.

MISE, an Anglo-French term (from Fr. mettre, to place) signifying a settlement out of accounts, disputes, &c., by agreement or arbitration. As an English legal term it was applied to the issue in a writ of right; and in history to the payment, in return for certain privileges, made by the county palatine of Chester to each new earl, and by the Welsh to each new lord of the Marches, or to a prince or king on his entry into the country. In its more general sense of agreement the term is familiar in English history in the "Mise of Amiens," in January, and that of Lewes, in May of 1264, made between Henry III. and the barons.

MISENUM, an ancient harbour town of Campania, Italy, about 3 m. S. of Baiae (q.v.) at the western extremity of the Gulf of Puteoli (Pozzuoli). Until the end of the Republic it was dependent on Cumae, and was a favourite villa resort. Agrippa made the fine natural harbour into the main naval station of the Mediterranean fleet, and founded a colony there probably in 31 B.C. The emperor Tiberius died in his villa here. Its importance lasted until the decline of the fleet in the 4th century A.D. It was at first an independent episcopal see: Jeremy the Great united it with that of Cumae. In 950 it was seized by the Saracens. The name was derived from one of the companions of Ulysses, or from Aeneas' trumpeter, an account of whose burial is given in Virgil, Aeneid, vi. 232.

The harbour consisted of the outer basin, or Porto di Miseno, protected by mole, of which remains still exist, and the present Mare Merto, separated from it by a comparatively modern embankment. The town lay on the south side of the outer harbour, near the village of Miseno, where remains of a theatre and baths and the inscriptions relating to the town have been found. Remains of villas can also be traced, and to the largest of these, which occupied the summit of the promontory, and belonged first to Marius, then to Lucullus, and then to the imperial house, probably belongs the subterranean Grotta Dragonara. Roads ran north to Baiae and north-west past the modern Torre Gaveta to Cuma: along the line of both are numerous columbaria.

Setl. ibid., Campanien, ed. ii. (Breslau, 1890), 190 sqq. (T. As.)

MISER, a term originally meaning (as in Lat.) miserable or wretched, but now used for an avaricious person who hoards up money and who spends the smallest possible sum on necessities.

MISERERE (the imperative of Lat. misereri, to have mercy or pity), the name of one of the penitential psalms (liv.), from its opening words, Misereor mei, Deus. The word is frequently used in English as equivalent to "Misericord" (Lat. misericordia, pity, compassion) for various forms in which the rules of a monastic order, or general discipline of the clergy might be relaxed; thus it is applied to a special chamber in a monastery for those members who were allowed special food, drink, &c., and to a small bracket on the side of the seat in a stall of a church made to turn up and afford support to a person in a position between sitting and standing. "Misericord" and "miserere" are also used of a small dagger, the "dagger of mercy," capable of passing between the joints of armour, with which the coup de grâce might be given to a wounded man.

MISHAWAKA, a city of St Joseph county, Indiana, U.S.A., on the St Joseph river of Michigan, about 80 m. E. by S. of Chicago. Pop. (1900), 5560 (821 foreign-born); (1910) 11,886. It is served by the Grand Trunk and the Lake Shore & Michigan Southern railways, and by inter-urban electric lines. It has an extensive trade in grain and other agricultural products. Two miles up the river is the Hen Island dam, which, with the Mishawaka hydraulic dam nearer the city, is the source of much of the power used by the city's manufactories. St Joseph Iron Works was laid out on the south side of the river, in 1833, and in 1835 was organized as a village and two additions were platted. In 1836 Indiana City was laid out on the north side of the river;
and in 1839 St Joseph Iron Works, with its two additions, and Indiana City were incorporated as one town named Mishawaka—"the name of an Indian village formerly occupying a part of the present site. Mishawaka was chartered as a city in 1890.

MISHMI, a hill-tribe on the frontier of Eastern Bengal and Assam. The Mishmis occupy the hills from the Dihong to the Brahmakund, in the north-eastern corner of the Brahmaputra valley. In 1854 M. Krick and M. Bourri, two French missionaries, were murdered in the Mishmi country, but their death was avenged by a small expedition which took the murderer prisoners. In 1890 another British expedition was sent against the Mishmis, owing to the murder of some British subjects.

MISSIONES, a territory of northern Argentina, bounded N. by Paraguay and Brazil, E. and S. by Brazil and W. by Paraguay and the Argentine province of Corrientes. Its boundary lines are formed by the upper Paraná and Iguazu streams on the N., the San Antonio and Pequroy-guassu streams on the E. and the Uruguay River on the S. Area, 11,282 sq. m.; pop. (1904, estimate), 58,775, chiefly Indians and mestizos. The territory is a region of rough broken surfaces, divided longitudinally by low mountains, called the Sierra Iman and Sierra Grande de Misiones, which form the water-parting for many small streams flowing northward to the Paraná and the Rivers in the Uruguay. The greater part of the country is covered with forest and tropical jungle. The climate is sub-tropical, the temperature ranging from 40° to 95° F. The soil is described as highly fertile, but its products are chiefly confined to yerba mate or Paraguay tea (Ilex paraguayensis), tobacco and oranges and other fruits. Communication with the capital is maintained by two lines of steamboats running to Corrientes and Buenos Aires, but a railway across Paraguay from Asunción is planned to encarcarn, opposite Posadas. Some of the Jesuit missions of the 17th and 18th centuries were established in this territory, and are to-day represented by the lifeless villages of Candelaria, Santa Ana, San Ignacio and Corpus along the Paraná River, and Apóstoles, Concepción, and San Javier along the Uruguay River. Posadas (estimated pop. in 1905, 8,000), the capital, on the Paraná, officially dates from 1865. It was also a Jesuit settlement called Itapua, though the large mission of that name was on the Paraguayan side of the river. It is at the extreme west of the territory, and is the terminal port for the steamers from Corrientes.

MISKOLCZ, capital of the county of Borsod, Hungary, 113 m. N.E. of Budapest by rail. Pop. (1900), 40,833. It is situated in a valley watered by the Szinva in the east of the Bükk mountains, and opens towards the south to the plain of the Sájó, an affluent of the Hernád. Miskolcze is a thriving town, and among its buildings are a Roman Catholic church of the 13th century in Late Gothic style, a Minorite convent, and Greek Catholic, Lutheran and Calvinist churches. It manufactures snuff, porcelain, boots and shoes, and prepared leather, and has both steam and water mills. It trades in grain, flour, wine, fruit, cattle, hides, honey, wax and agricultural products, while four well-attended fairs are held annually. About 5 m. west of the town in the Szinva valley is Dólszög (pop. 11,500), which possesses important iron-works, and the ruined castle of Dólszög, formerly a residence of the kings of Hungary. About 4 m. to the south-west of Miskolcze are the baths of Tapolca, containing warm springs. To the south-west of the town lies Onod (pop. 2087), to the south of which, on the banks of the Sájó, is the heath of Mohi or Muhi, famous as the scene of the great defeat of the Hungarians by the Mongols in 1111. About 85,000 Hungarian soldiers fell, and the whole country was devastated for the next two years by the Mongolian hordes. During the 16th and 17th centuries Miskolc suffered much from the Ottomans, and from the troops of George Rakóczy and Emeric Tököley. In 1781, 1843 and 1847 it was devastated by fire, and on the 30th of August 1878 a great portion of the town was ruined by a terrific storm.

MISPICKEL, a mineral consisting of iron sulpharsenide, FeAsS; it contains 48% of arsenic, and is of importance as an ore of this element. It is known also as arsenopyrite or amesite pyrites (Ger. Arsenkies); mispickel is an old name of German origin, and in the form Mispikel was used by G. Agricola in 1546. The crystals are orthorhombic, with angles similar to those of marcasite; they are often prismatic in habit, and the prism M is usually terminated by the deeply striated faces of an obtuse dome r. Twinning is not uncommon, the twin-planes M (110) and g (101) being the same as in marcasite. The colour of the mineral is silver-white or steel-grey, with a metallic lustre, but it is only tarnished yellow; the streak is greyish-black. The hardness is 3½-6, and the specific gravity 5.0-6.2.

Mispickel occurs in metalliferous veins with ores of tin, copper, silver, &c. It is occasionally found as embedded crystals, for example, in serpentine at Reichenstein, Silisia. In Cornwall and Devon it is associated with cassiterite in the tin- lodes, but is also found in the copper-lodes: well crystallized specimens have been obtained from the neighbourhood of Tavistock, Redruth and St Agnes. Mispickel is the principal source of arsenic oxide or the "white of commerce" (see Arsenious Acid). There are several varieties as from Cornwall and Devon, and Freiberg in Saxony, and from Canada and the United States.

Danaithe is a cobaltiferous variety of mispickel, containing up to 9% of cobalt replacing iron; it was first noticed by J. F. Dana in 1824 at Franconia in New Hampshire. This variety forms a passage to the species glucodote, (Co,Fe)AsS, which is found as well-developed orthorhombic crystals in copper ore at Hânskoda in Ramberg parish, Vestmanland, Sweden. Other species belonging to this isomorphous group of orthorhombic minerals are marcasite (FeS2), löllingite (FeAs2), sallowite (CoAs2) and ramsdellbergite (NiAs2).

MISPRIISON (from O. Fr. mesprendre, mod. méprendre, to misunderstand), a term in English law, almost obsolete, used to describe certain kinds of offence. Writers on criminal law usually divide misprision into two kinds (a) negative, (b) positive.

(a) Negative misprision is the concealment of treason or felony. By the common law of England it was the duty of every liege subject to inform the king's justices and other officers of the law of all treasons and felonies of which the informant had knowledge, and to bring the offender to justice by razón de dello, as in the case of Shiffs vs. Basset (1582, S. 8.) The duty fell and still falls primarily on the grand jurors of each county borough or franchise, and is performed by indictment or presentment, but it also falls in theory on all other inhabitants (see Pollock and Maitland, Hist. Eng. Law, ii. 505). Failure by the latter to discharge this public duty constitutes what is known as misprison of treason or felony (see 3 Co. Inst., 139).

Misprision of Treason, in the words of Blackstone, "consists in the bare knowledge and concealment of treason, without any degree of assent thereto, for any assent makes the party a principal traitor." According to Bracton, de Coronâ, seq. 118, failure to reveal the treason of another was itself in high treason, but statutes of 1551-1552 and 1554-1555 made concealment of treason misprision only. Most of the statutes regulating procedure on trials for treason also apply to misprision of treason. The punishment is loss of the profit of the land, the confinement during life, forfeiture of all his goods and imprisonment for life. These punishments are not affected by the Felony Act 1870.

Misprision of Felony is the concealment of a felony committed by another person, but without such previous concert with, or subsequent assistance to, the concealer an accessory before or after the fact. The offence is a misdemeanour punishable on indictment by fine and imprisonment.

(b) Positive misprision is the doing of something which ought not to be done; or the commission of a serious offence falling short of treason or felony, in other words a misdemeanour of a public character (e.g. maladministration of high officials, contempt of the sovereign or magistrates, &c.). To endeavour to dissuade a witness from giving evidence, to disclose an examination before the privy council, or to advise a prisoner to stand mute, used to be described as misprisions (Hawk. P. C. bk. i. c. 20).
MISRULE—MISSAL

The old writers say that a misprision is contained in every felony and that the Crown may elect to prosecute for the misprision instead of the felony. This proposition merely affirms the right of the Crown to choose a more merciful remedy in certain cases, and has no present value in the law. Positive misprisions are now only of antiquarian interest, being treated as misdemeanours.

In the United States, misprision of treason is defined to be the crime committed by a person owing allegiance to the United States, and having knowledge of the commission of any crime against them, who conceals and does not, as soon as may be, disclose and make known the same to the president or to some judge of the United States, or to the governor, or to some judge or justice of a particular state. The punishment is imprisonment for not more than seven years and a fine of not more than one thousand dollars.

MISRULE, LORD OF, in medieval times the master of the Christmas revels. Probably J. G. Frazer (Golden Bough III) is right in suggesting that the lord or abbot of misrule is the successor of the king of the ancient Roman Saturnalia, who personated Saturn and suffered martyrdom at the end of the revels. Compare, too, the burlesque figure at the carnival, which is finally destroyed. Stow (Survey) writes: "In the feast of Christmas there was in the King's House, wheresoever he lodged, a Lord of Misrule or Master of merry diversports, and the like had ye in the house of every nobleman of honour or good worship, were he spiritual or temporal." The mayor and sheriffs of London also had Lords of Misrule. These mock-monarchs began their reign on All Hallows Eve, and misruled till Candlemas. In Scotland they were known as "Abbots of Unreason," and in 1555 a special act suppressing them was passed. In Tudor times their reign was marked by much display and expense. In Henry VIII's reign an order for a fool's coat is signed by six of the Privy Council. By an Act of Common Council (1555) the city expenses of the Lords of Misrule were severely curtailed. Machyn speaks of a Lord of Misrule who in 1561 rode through London followed by a hundred gentlemen on horseback hung with gold chains (see also REVELS, MASTER OF).

MISSAL, the book containing the liturgy, or office of the mass (missa), of the Roman Catholic Church. This name (e.g. Missale gallicum, francorum, gallicanum vetus) began to supersede the older word Sacramentary (sacramentarium, liber sacramentorum) from about the middle of the 8th century. At that period the book so designated contained merely the fixed canon of the mass or consecration prayer (actionem, precem canonicae, canonem actionis), and the variable collects, sacred or orationes super obiata, prefaces, and post-communions for each fast, vigil, festival or feria of the ecclesiastical year; for a due celebration of the Eucharist they required according to be supplemented by other books, such as the Antiphonarium, afterwards called the Graduale, containing the proper antiphons (introits), responsories (graduals), tracts, sequences, offertories, communions and other psalms; the community was designed to be sung by the choir or choir, and the Lecitarium (or epistolarium and evangelistarium) with the proper lessons.  

Afterwards missals contained more or less fully the antiphons and lessons as well as the prayers proper for the various days, and these were called missala plenaria. All former missals are of this last description. The Missale romanum ex decreto ss. concilii Tridentini restitutum, now in almost exclusive use throughout the Latin obedience, owes its present form to the council of Trent, which undertook the preparation of a correct and uniform liturgy, and entrusted the work to a committee of its members. This committee had not completed its labours when the council rose, but the pope was instructed to receive its report when ready and to act upon it. The "reformed missal" was promulgated by Pius V. on the 14th of July 1570, and its universal use enjoined, the only exceptions being churches having local liturgies which had been in unbroken use for at least two centuries. It has undergone subsequent slight revisions under Clement VIII. (1604), Urban VIII. (1634) and Leo XIII. (1884), and various new masses, both obligatory and permissive, universal and local, have been added. Although the Roman is very much larger than any other liturgy, the communion office is not in itself inordinately long. The greater part of it is contained in the "ordinary" of the mass, usually placed about the middle of the missal, and occupies, though in large type, only a few pages. The work owes its bulk and complexity to two circumstances. On the one hand, in the celebration of the sacrifice of the mass practically nothing is left to the discretion of the officiating priest; everything—what he is to say, the tone and gestures with which he is to say it, the cut and colour of the robe he is to wear—is carefully prescribed in the rubrics. On the other hand, the Roman, like all the Western liturgies, is distinguished from those of the Eastern Church by its flexibility. A distinctive character has been given to the office for each ecclesiastical season, for each fast or festival of the year, almost for each day of the week; and provision has also been made of a suitable communion service for many of the special occasions both of public and of private life.

The different parts of the Roman communion office are not all of the same antiquity. Its essential features are most easily caught, and best understood, by reference to the earliest sacramentaries (particularly the Gregorian, which was avowedly the basis of the labours of the Tridentine committee), to the Gregorian Antiphonary, and to the oldest redaction of the Ordo romanus. The account of the mass (qualiter Missa Romana celebratur) as given by the sacramentarium gregorium is to the effect that there is in the first place the Introit according to the time, whether for a festival or for a common day; thereafter Kyrie eleison. (In addition to this Gloria in excelsis Deo is said if a bishop is [the celebrant], though only on Sundays and festivals; but a priest is by no means to say it, except only at Easter tide. When there is a litany (quando letania agitur) neither Gloria in excelsis nor Alleluia is sung.) Afterwards the Oratio is said, whereupon follows the Apostulos, also the Gradual and Alleluia. Afterwards the Gospel is read. Then comes the Offertorium, and the Oratio super obiata is said. Then follow the suffrages, the Curia, the Lord's Prayer and "emolium" (ἐμπορρύψας or insertion, Liber orae et Domine), given at full length precisely as they still occur in the Roman missal.
In every liturgy of all the five groups a passage similar to this occurs, beginning with Sursum corda, followed by a Preface and the recitation of the Sanctus or Angelic Hymn. The cantor or deacon, according to the ritual, recites or composes a prayer, which in all of them occurs immediately after, invariably contains our Lord’s words of institution, and (except in the Nestorian liturgy) concludes with the Lord’s Prayer and “emolism.” But there are certain differences of arrangement, by which the groups of liturgies can be classified. Thus it is distinctive of the liturgy of Jerusalem that the “great intercessions” for the quick and the dead follows the words of institution and an Epiklesis (ἐπίκλησις τοῦ πνεύματος ἁγίου) or petition for the descent of the Holy Spirit upon the gifts; in the Alexandrian the “great intercessions” has its place in the Preface; in the East Syrian it comes between the words of restitution and the Epiklesis; in the Ephesians it comes before the Preface; while in the Roman it is divided into two, the commemoration of the living being before, and that of the dead after, the words of institution. Other distinctive features of the Roman liturgy are (1) the position of the “Pax” after the consecration, and not as in all the other liturgies at a very early stage of the service, before the Preface even; and (2) the absence of the Epiklesis common to all the others. The words of its “canonical prayer” are of unknown antiquity; they are found in the extant manuscripts of the Sacramentarium gelosianum, and were already old and forgotten authorship in the time of Gregory the Great; in these, in a letter of Gregory the Great to the Bishop of Jerusalem, it is written (Regest. Epist. vii. 64), speaks of it as “the prayer composed by a ‘scholastic’” (precem quam scholasticum composuerat). The same letter is interesting as containing Gregory’s defence, on the ground of ancient use, of certain parts of the Roman ritual to which the bishop of Syracuse had taken exception as merely borrowed from Constantinople. Thus we learn that, while at Constantinople the Kyrie eleison was said by all simultaneously, it was the Roman custom for the clergy to repeat the words first and for the people to respond, Christe eleison being also repeated an equal number of times. Again, the Lord’s Prayer was said immediately after the consecration aloud by all the people among the Greeks, but at Rome by the priest alone.

The meagre liturgical details furnished by the Sacramentarium gregorianum are supplemented by the texts of the Ordo romanus, the first of which dates from about the year 730. The ritual they enjoin is that for a pontifical high mass in Rome itself; but the differences to be observed by a priest “quando in statione facit missas” are comparatively slight. Subjoined is a précis of Ordo Romanus I.

It is first of all explained that Rome has seven ecclesiastical regions, each with its proper deacons, subdeacons and acolytes. Each region has its own day of the week for high ecclesiastical functions, which are celebrated by each in rotation. [This accounts for the Stato ad S. Maria Maggiore, ad S. Crucem in Jerusalem, ad S. Petrum, &c., prefixed to most of the masses in the Gregorio Sacramentary, and still retained in the "Proprium de Tempore" of the Roman missal.] The regulations for the assembling and marshalling of the procession by which the pontiff is met and then escorted to the appointed station are minutely given, as well as for the disposition of the clergy in the Order of the Liturgy. The sanctity has been reached. He does not leave the sacristy until the Introit has been begun by the choir in the church. Before the Gloria he takes his stand at the altar, and after the Kyrie Eleison he跪下 his knees in the Preface (or at his discretion) he begins the Gloria in excelsis, which is taken up by the choir. During the singing he faces eastward; at its close he turns round for a moment to say “Pax vobis,” and with this begins the Oratio. This finished, all sit themselves in order while the subdeacon ascends the steps of the altar. After the Laudes the Pontiff cantor with his book (cantatorio) ascends and gives out the response (Responsum) with the Alleluia and Tractus in addition if the season calls for either. The deacon then softly kisses the feet of the pontiff, who renders his blessing in the words “Dominus sit in corde tuo et in labis tuis.” Proceeded by acolytes with lighted candles and subdeacons burning incense, he ascends the ambo, where he reads the Gospel. At the close, with the words “Pax tibi” and "Dominus vobiscum," the pontiff, after another Oratio, descends to the "sacerdorium" accompanied by certain of the inferior clergy, and receives in order the oblations of the rulers (oblationes principum), the archdeacon who follows taking their "amulas" of wine and water from the offerer. The other offerings are received from the other ranks and classes present, including the women. This concluded, the pontiff and archdeacon wash their hands, the offerings being meanwhile arranged by the subdeacons on the altar, and water, supplied by the leader of the choir (archipræphonsista), and lambing, with the cup containing the blood of the victim, have been engaged in singing the Offertorium; when all is ready the pontiff signs them to stop, and enters upon the Preface, the subdeacons giving the responses. At the Angelic Hymn (Sanctus) all kneel, continue kneeling, except the pontiff, who rises and begins the Canon. At the words "per quern hæc omnia" the archdeacon lifts the cup with the oblates, and at "Pax Domini sit semper vobis" he gives the peace to the clergy in their order, the deacon to the people. Then follows the elevation of the consecrated bread and lays it upon the altar; the rest he places on the paten held by the deacon. It is then distributed while Agnus Dei is sung. The pontiff in communicating puts the particle into the cup, saying, "Fiat communio, sancrosancti corporis et sanguinis Domini nostri Jesu Christi accipientibus nobis in vitam aeternam." Those present communicate in their order under this species also. As the pontiff descends into the senatorium to give the communion, the schola begins the communio Antiphon, and continues singing it, according to the custom of Rome, all the bisontes having received the sign to begin the Gloria, after which, the verse having been again repeated, they stop. The celebrant, then, facing eastward, offers the Oratio ad complendum, which being finished the archdeacon says to the people, "Ite, memoriter, unum vocatio".

This note treats of the Roman communion office as it was prior to the end of the 8th century. We must now turn to the Gregorian Antiphonars sine gradualibus liber ordinatus per circulum anni, which as its name implies contains those variable portions of the mass which were intended to be sung by the schola or choir. It gives for each day for which a proper mass is provided: (1) the Antiphona (Antiphona ad Iutroitum) and Psalmus; (2) the Responsorium and Versus, with its Alleluia and Versus; (3) the Offertorium and Versus; (4) the Communio and Psalmus. Some explanation of each of these terms is necessary. (1) The word Antiphon (ἀντιφωνον, O.Eng. Anteun, Eng. Anthem) in its ecclesiastical use has reference to the very ancient practice of relieving the voices of the singers by dividing the work between alternate choirs. In one of its most usual meanings it has the special signification of a sentence (usually scriptural) constantly sung by one choir between the verses of a psalm or hymn sung by another. According to the Roman liturgiologists it was Pope Celestine who enjoined that the Psalms of David should be sung (in rotation, one presumes) antiphonally before mass; in process of time the antiphon came to be sung at the beginning and end only, and the psalm itself was reduced to a single verse. In the days of Gregory the Great the introit appears to have been sung precisely as at present—that is to say, after the antiphon proper, the Psalmus with its Gloria, then the antiphon again. (2) The Responsorium, introduced between the epistle and gospel, was probably at first an independent or canticle, originally given out by the cantor from the steps from which the epistle had been read (hence the later name Graduale), the response being taken up by the whole choir. (3) The Offertorium and Communio correspond to the "hymn from the book of Psalms" mentioned by early authorities (see, for example, Augustinian, Retr. ii. 11; Ap. Const. vii. 13) as sung before the oblation and also while that which had been offered was being distributed to the people. A very intimate connexion between these four parts of the choral service can generally be observed; thus, taking the first Sunday in the ecclesiastical year, we find both in the Antiphonary and in the modern Missal that the antiphon is Ps. xxv. 1-3, the psalmus Ps. xxv. 4, the responsorium (graduale) and versus Ps. xxv. 3 and xxv. 4, the offertorium and versus Ps. xxv. 1-3 and xxv. 5. The communio is Ps. lxxxi. 12, one of the verses of the responsorium being Ps. lxxxi. 7. In the selection of the introits there are also traces of a certain rotation of the psalms in the Psalter having been observed.

The first pages of the modern Roman missal are occupied with the Calendar and a variety of explanations relating to the

1 This was one of the points discussed at the council of Florence, and Cardinal Bessarion for a time succeeded in persuading the Greeks to give up the Epiklesis.

2 Quam collectam dicunt, Ord. Rom. II.
year and its parts, and the manner of determining the movable feasts. The general rubrics (Rubricae generales missalis) follow, explaining what are the various kinds of mass which may be celebrated, prescribing the hours of celebration, the kind and colour of vestments to be used, and the ritual to be followed (ritus celebrandi missam), and giving directions as to what is to be done in case of various defects or imperfections which may arise. The Praeportatio ad missam, which comes next, is a short manual of devotion containing psalms, hymns and prayers to be used as opportunity may occur before and after celebration.

Next comes the proper of the season (Proprium missarum de tempore), occupying more than half of the entire volume. It contains the proper introit, collect (one or more), epistle, gradual (tract or sequence), gospel, offertory, secreta (one or more), communion and post-communion for every Sunday of the year, and also for the festivals and feasts connected with the ecclesiastical seasons, as well as the offices peculiar to the Ember days, Holy Week, Easter and Whitsuntide. Between the office of Holy Saturday and that for Easter Sunday the ordinary of the mass (Ordo missae), with the solemn and proper prefaces for the year, and the canon of the mass is inserted. The proper of the season is followed by the proper of the saints (Proprium sanctorum), containing what is special to each saint's day in the order of the calendar, and by the Commune sanctorum, containing such offices as the common of one martyr and bishop, the common of one martyr not a bishop, the common of many martyrs in paschal time, the common of many martyrs out of paschal time, and the like. A variety of masses to be used at the feast of the dedication of a church, of masses for the dead, and of votive masses (as for the sick, for persons journeying, for bridegroom and bride) follow, and also certain benedictions. Most missals have an appendix also containing certain local masses of saints to be celebrated "ex indulto apostolico."

Masses fall into two great subdivisions: (1) ordinary or regular, which are performed in ordinarium officii, oratorii, celebrant according to the regular rotation of fast and feast, vigil and feria, in the calendar; (2) extraordinary or occasional (extra ordinem officii), being either "votive" or "for the dead," and from the nature of the case having no definite time prescribed for them. Festival masses are either double, half-double or simple, an ordinary Sunday mass being a half-double. The difference depends on the number of collects and secretae; on a double only one of each is offered, on a half-double there are two or three, and on a simple there may be as many as five, or even seven, of each. Any mass may be either high (missa solennis) or low (missa privata). The distinction depends upon the number of officiating clergy, certain differences of practice as to what is pronounced aloud and what inaudibly, the use or absence of incense, certain gestures and the like. Solitary masses are forbidden; there must be at least an acolyte to give the responses. The vestments prescribed for the priest are the amice, alb, cinctum or girdle, maniple, stole and chasuble (plena). There are certain distinctions of colour for a bishop or abbot. The colour of the vestments and of the drapery of the altar varies according to the day, being either white, red, green, violet or black. This last custom does not go much further back than Innocent III., who explains the symbolism intended (see Vestments).

Subjoined is an account of the manner of celebrating high mass according to the rite at present in force.

1. The priest who is to celebrate, having previously confessed (if necessary) and having finished matins and lauds, is to seek leisure for private prayer (lating) and to use as he has opportunity the "prayer of the sacrificant" already prescribed. How the rite of the sacrificant is next to be gone about is minutely prescribed, and prayers are given to be used as each article is put on. The sacramental elements having previously been placed on the altar or on a credence table, the celebrant enters the church and takes his stand before the lowest step of the altar, having the deacon on his right and the subdeacon on his left. After invoking the Trinity (In nomine Patris, &c.) he repeats alternately with those who are with him the psalms, Alleluia, Deux; which is preceded in the usual way by an antiphon (Introito ad altare Dei), and followed also by the Gloria and Antiphon.1

The versicle "Adjutorium nostrum," with its response "Qui facit," is followed by the "Confiteor," and the priest and by the attendants, who in turn respond with the prayer for divine forgiveness, "Misericordia." The priest then gives the absolution ("Indulgementum"), and after the versicles and responses he begins the orans. It is then as follows: "Oremus," and ascending to the altar silently offers two short prayers, one asking for forgiveness and liberty of access through Christ, and another indulgence for himself, through the merits of the saint and relics of the saint, who, coming from the deacon he ceases the altar, and is therewith himself preceded by the deacon. He then reads the Introit, which is also sung by the choir; the Kyrie eleison is then said, after which the words Gloria 4 are sung by the celebrant and the end of the hymn completed by the choir.

2. Kissing the altar, and turning to the people with the formula "Dominus vobiscum," the celebrant proceeds with the collect or orans. He then, on the first or second day, reads the epistle, and with a "Dominus vobiscum" and minuter prescribed censing and censing gives out and reads the gospel for the day, at the close of which a "Laus tibi, Christe" is said, and the book is brought to the celebrant, who kisses the pages and says the prayer "Preparantur nostrae delicta." The celebrant then standing at the middle of the altar sings the words "Credo in unum Deum," and the rest of the Nicene Creed is sung by the choir.

3. With "Dominus vobiscum," and "Oremus," the celebrant proceeds to read the orant officium, which is also sung by the choir. This finished he receives the patten with the host from the deacon, and after offering the host with the prayer beginning "Suscipe," Suscipe Patri, place it on the altar. Then the deacon ministres wine and the subdeacon water, and before the celebrant mixes the water with the wine he blesses it in the prayer "Deus qui manuae." He then takes the chalice, and having offered it to the celebrant, who kisses it, places it upon the corporal and covers it with the pall. Slightly bowing over the altar, he then offers the prayer "In spiritu humiliatis," and, lifting up his eyes and stretching out his hands, proceeds with Veni sanctificator. After which, if there be no incense, the celebrant as before (archangelus) he takes the thurible from the deacon and censes the bread and wine and altar, and is afterwards himself censed as well as the others in their order. Next going to the epistle side of the altar, he kisses the bishop, and prays the prayer "Cum sanctitate," as before (fides ecclesiae, &c., &c.).

4. Again saluting with a "Dominus vobiscum," he lifts up his hands and goes on to the Sursum corda and the rest of the Preface. A different intonation is given for each of the prefaces. After the incense the celebrant sings the Preface (Sanctus), and the deacon takes the form of consecration after the words of consecration of the wafer, which are said "secretly, distinctly, and attentively," the celebrant kneels and adores the host, raises elevates it, and replacing it on the corporal adores.

Introitum further on. This use of the 43rd Psalm goes as far back as the end of the 11th century; being mentioned by Micrologus (1080). It is omitted in masses for the dead and during Holy Week.

1 A form very similar to the present is given by Micrologus, and is still adhered even in liturgical literature of the 6th century.

2 During Lent and for the Sundays and Holy Days, the deacon and subdeacon are omitted, this is omitted. In low masses it is of course said, not sung (if it is to be said). It may be added that this early position of the Gloria in excelsis is one of the features distinguishing Roman from Ephesian use.

3 The tract is peculiar to certain occasions, especially of a mournful nature, and is sung by a single voice. By a sequence is understood a more or less metrical composition, not in the words of Scripture, but in free verse or metre designed for the purpose. In the simple, the sequence, "Lauda Sion Salvatorum," on Corpus Christi day.

4 On certain days the Credo is omitted.

5 Now eleven: they were at one time much more numerous.

6 The approved usage appears to be in that case that it is sung as far as "Hosanna in excelsis" before the elevation, and "Benedictus qui venit" is reserved till afterwards. In France it was a very common custom, made general for a time at the request of Louis XII, to sing "O salutaris hostis" at the elevation.

1 This antiphon is not to be confounded with the Antiphon ad
MISSI DOMINICI—MISSIONS

it (the bell meanwhile being rung). The same rite is observed when the chalice is consecrated. Immediately before the Lord's Prayer, at the words "per ipsum et cum ipso et in ipso," the sign of the cross is made three times over the chalice with the host, and towards the close of the "emblem" the fraction of the host takes place. After the words "Pax Domini sit semper vibiscum," the emission of the particle into the cup takes place with the words "Haec commissio et consecratio," &c. The celebrant then says the Litany of the Blessed Virgin.

5. While the choir sings the Agnus Dei and the Communiation, the celebrant proceeds, still "secreto," with the remainder of the office, which though printed as part of the canon is more conveniently called a "proper". At the postcommunion, he salutes the deacon with the "signum," and then conveys the "tuum," under the sign of the cross, to the clergy. Thus the chalice may be consecrated. The celebrant then communicates under both species with suitable prayers and actions, and afterwards administers the sacrament to the other communicants if there be any. Then while the wine is poured into the cup for the first ablation he says "Quod ore sumpimus"; having taken it he says, "Corpus tuum, Domine." After the second ablation he goes to the book and reads the Communiation. Then turning to the people with "Dominus vibiscum," he reads the postcommunion (one or more); turning once more to the congregation he uses the old official formula "Dominus vibiscum." (R. Et cum spiritu tuo). And "Te, isse est," or "Benedicamus Dominum," in those masses from which Gloria in excelsis has been omitted (R. Deo Gratias). Bowing down before the altar he offers the prayer "Pax," and the litany of the Virgin, then he makes the sign of the cross over the congregation with the words of the benediction ("Benedictus"). Then he reads the address from the gospel of John beginning with "In principio erat Verbum," or else the proper address of the day.

MISSI DOMINICI, the name given to the officials commissioned by the Frankish kings and emperors to supervise the administration of their dominions. Their institution dates from Charles Martel and Pippin the Short, who sent out officials to see their orders executed. When Pippin became king in 754 he sent out missi in a desultory fashion; but Charlemagne made them a regular part of his administration, and a capitulary issued about 802 gives a detailed account of their duties. They were to execute justice, to enforce respect for the royal rights, to control the administration of the counts, to receive the oath of allegiance, and to supervise the conduct and work of the clergy. They were to call together the officials of the district and explain to them their duties, and to remind the people of their civil and religious obligations. In short they were the direct representatives of the king or emperor. The inhabitants of the district they administered had to provide for their subsistence, and at times they led the host to battle. In addition special instructions were given them concerning various matters which have been pointed out. The districts, placed under the missi, which it was their duty to visit four times a year, were called missae or legationes. They were not permanent officials, but were generally selected from among persons at the court, and during the reign of Charlemagne personages of high standing undertook this work. They were sent out in twos, an ecclesiastic and a layman, and were generally complete strangers to the district which they administered. In addition there were extraordinary missi who represented the emperor on special occasions, and at times beyond the limits of his dominions. Even under the strong rule of Charlemagne it was difficult to find men to discharge these duties impartially, and after his death in 814 it became almost impossible. Under the emperor Louis I, the nobles interfered in the appointment of the missi, who, selected from the district in which their duties lay, were soon found watching their own interests rather than those of the central power. Their duties became merged in those of the bishops, and the archbishops. The emperor Charles the Bald they took control of associations with the reservation of the peace. About the end of the 9th century they disappeared from France and Germany, and during the 10th century from Italy. It is possible that the itinerant justices of the English kings Henry I. and Henry II., the itinerant bailifs of Philip Augustus king of France, or the royal enqueteurs of St Louis originated from this source.

MISSIONS (Lat. missio, a sending) the term used especially for the propagandist operations of the Christian Church among the heathen, the excurtants of this work being missionaries. Both "mission" and "missionary" have hence come to be used of similar works in other spheres. The history of Christian missions may, for practical purposes, be divided into three chief periods: (1) the primitive, (2) the medieval and (3) the modern.

THE PRIMITIVE PERIOD

There can be little doubt that the Christian Church derived its missionary impulse from the teaching of its founder. Even though we may feel some hesitancy in the light of modern criticism, about accepting as authentic the specific injunctions ascribed to Jesus by Matthew (ch. xxviii. 19) and Luke (ch. xxiv. 47; Acts i. 8), it must be admitted that the teaching of Jesus, in the emphasis which it laid on the Fatherhood of God and the brotherhood of man, was bound sooner or later to break away from the trammels of Judaism, and assert itself in the form of Christian missions. The triumph of this "universalistic" element in the teaching of Christ is vividly portrayed in the Acts of the apostles. At the beginning of the Acts the Christian Church is a little Jewish sect; long before the end is reached it has become a world-conquering spiritual force. The transformation was due in its initial stages to broad-minded men like Stephen, Philip and Barnabas who were the first pioneers of missionary work. Their efforts, however, were soon completely eclipsed by the magnificent achievements of the apostle Paul, who evangelized a large part of Asia Minor and the most important cities of Greece. The success which attended the work of the great apostle to the Gentiles stamped Christianity as a missionary religion for ever. From this point onwards Christianity pushed its way into all the great centres of population. We know very little about the missionaries of the first three centuries. We suddenly find province after province christianized though there is nothing to show how and by whom the work was done. The case of Bithynia is an excellent illustration of this. When Pliny wrote his famous letter to Trajan (A.D. 112), Christianity had taken such a firm hold of the province that its influence had penetrated into remote country districts, pagan festivals were almost entirely neglected, and animals for sacrifice could scarcely find purchasers. Yet the history of the conversion of Bithynia is absolutely buried in oblivion. By the time of Constantine, Christianity had practically covered the whole empire. Harnack has tabulated the results which our scanty data allow us to reach in his Expansion of Christianity. He divides the countries which had been evangelized by the close of the 3rd century into four groups: (1) Those countries in which Christianity numbered nearly one-half of the population and represented the standard religion of the people, viz. most of what we now call Asia Minor, that portion of Thrace which lay over against Bithynia, Armenia, the city of Edessa. (2) Those districts in which Christianity formed a very material portion of the population, influencing the leading classes and being able to hold its own with other religions, viz. Antioch and Coele-Syria, Cyprus, Alexandria together with Egypt and the Thebais, Rome and the lower parts of Italy, together with certain parts of middle Italy, Proconsular Africa and Numidia, Spain, the maritime parts of Greece, the southern coasts of Gaul.
(3) Those districts in which Christianity was sparsely scattered, viz. Palestine, Phoenicia, Arabia, certain parts of Mesopotamia, the interior districts of Greece, the provinces on the north of Greece, the northern districts of middle Italy, the provinces of Mauretania and Tripolit. (4) Those districts in which Christianity was nominal or even non-existent where it was hardly found at all: the districts to the north and north-west of the Black Sea, the western section of upper Italy, middle and upper Gaul, Belagica, Germany, Rhaetia, the towns of ancient Philistia. It is not possible to obtain even an approximate estimate of the numbers of the Christians at the time of Constantine. Friedländer, for instance, does not think that they exceeded by much Gibbon’s estimate for the reign of Decius, viz. one-twentieth of the population. La Bastie and Burchhardt put the ratio at one-twelfth, Matter at a fifth and Stäudlin even at a half (see Harnack ii. 453).

After the end of the 3rd century missionary enterprise was mainly concentrated on the outlying borders of the empire. In the 4th and 5th centuries may be mentioned Gregory the Illuminator, the “apostle of Armenia” (about 300). Ulfilas, the “apostle of the Goths,” about 325; Frumentius, a bishop of Abyssinia, about 327; Nino, the Armenian girl who was the means of converting the kingdom of Iberia (now Georgia), about 330; Chrysostom, who founded at Constantinople in A.D. 404 an institution in which Goths might be trained to preach the Gospel to their own people; Martin of Tours, who evangelized the central districts of Gaul and Valentinus, the “apostle of Noricum,” about 440; Honoratus, who from his monastic home in the islet of Lerins, about 410, sent missionaries among the masses of heathendom in the neighbourhood of Arles, Lyons, Troyes, Metz and Nice; and St. Patrick, who converted Ireland into “the isle of saints” (died either in 463 or 493).

**The Medieval Period**

With the 5th century the Church was confronted with numberless hordes, which were now precipitated over the entire face of Europe. Having for some time learnt to be aggressive, she girded herself for the difficult work of teaching the nations a higher faith than a savage form of nature-worship, and of fitting them to become members of an enlightened Christendom.

(a) The Celtic Missionaries.—The first pioneers who went forth to engage in this difficult enterprise came from the secluded Celtic Churches of Ireland and the Scottish Highlands. Of many who deserve mention in connexion with this period, the most prominent were: Columba, the founder of the famous monastery of Iona in 563 and the evangelizer of the Albanian Scots and northern Picts; Aidan, the apostle of Northumbria; Columbanus, the apostle of the Burgundians of the Vosges (590); Gallach or Gallus (d. 646), the evangelizer of north-eastern Switzerland and Alemanian; Kilian, the apostle of Thuringia; and Trudpert, the martyr of the Black Forest. The zeal of these men seemed to take the world by storm. Travelling generally in companies, and carrying a simple outfit, these Celtic pioneers flung themselves onto the continent of Europe, and, not content with reproducing at Annegray or Luxeuil the willow or brushwood huts, the chapel and the round tower, which they had left behind in Derry or in the island of Hy (Iona), they braved the dangers of the northern seas, and penetrated as far as the Faroes and even farther Iceland. Their zeal and success, to quote the words of Kurtz, “are witnessed to by the fact that at the beginning of the 8th century, throughout all the districts of the Rhine, as well as the Rhone, Thuringia, Bavaria and Alemannia, we find a network of flourishing churches bearing the impress of Celtic institutions.”

(b) The English Missionaries.—Thus they laid the foundations, aweing the heathen tribes by their indomitable spirit of self-sacrifice and the sternness of their rule of life. But, marvellous as it was, their work lacked the element of permanence; and it became clear that a more practical system must be devised and carried out. The men for this work were now ready, and the success of the newly evangelized English Church was ready to go forth. The energy which had been spent to conquer was now “exhibited in the enterprise of conversion and teaching” by Wilfrid on the coast of Friesland, by Willibrord (658–715) in the neighbourhood of Utrecht, by the martyr-brothers Ewald and Heswall amongst the “old” or continental Saxons, by Sibald the apostle of the tribes between the Elbe and the Yssel, by Adelbert, a prince of the royal house of Northumbria, in the regions north of Holland, by Wursing, a native of Friesland, and one of the disciples of Willibrord, in the same region, and last, not least, by the famous Winfrid or Boniface, the “apostle of Germany” (680–755), who went forth first to assist Willibrord at Utrecht, then to labour in Thuringia and Upper Hesse, then with the aid of his kinsmen Wunibald and Willibald, their sister Walpurga, and her thirty companions, to consolidate the work of earlier missionaries, and finally to die a martyr on the shore of the Zuider Zee.

(c) Scandinavian Missions.—Devoted, however, as were the labours of Boniface and his disciples, all that he and they and the emperor Charlemagne after them achieved for the fierce untutored world of the 8th century seemed to have been done in vain when, in the 9th “on the north and north-west the pagan Scandinavians were hanging about every coast, and pouring in at every inlet; when on the east the pagan Hungarians were swarming like locusts and devastating Europe from the Baltic to the Alps; when on the south and south-east the Saracens were pressing on and on with their victorious hosts. It seemed then as if every pore of life were choked, and Christendom must be stifled and smothered in the fatal embrace.”

But the devoted Anskar (801–865) went forth and sought out the Scandinavian viking, and handed on the torch of self-denying zeal to others, who saw, after the lapse of many years, the close of the monotonous tale of burning churches and pillaged monasteries, and taught the fierce Northman to learn respect for civilized institutions.

The gospel was first introduced into Norway in the 10th century by an Englishman named Hacon, though the real conversion of the country was due to Olaf Tryggvason. About the same time, and largely owing to the exertions of Olaf, Iceland, Greenland and the Orkney and Shetland islands were also evangelized.

(d) Slavonic Missions.—Thus the “gospel of the kingdom” was successively proclaimed to the Roman, the Celtic, the Teutonic and the Scandinavian world. A contest still more stubborn remained with the Slavonic tribes, with their triple and many-headed divinities, their powers of good and powers of evil, who could be propitiated only with human sacrifices. Mission work commenced in Bulgaria during the latter part of the 9th century; thence it extended to Moravia, where in 863 a band of Greek missionaries—Cyril and Methodius—provided for the people a Slavonic Bible and a Slavonic Liturgy; thence to Bohemia and Poland, and so onwards to the Russian kingdom of Ruric the Northman, where about the close of the 10th century the Eastern Church “silently and almost unconscious went into the world her mightiest offspring.”

But, though the baptism of Vladimir (c. 956–1015) was a heavy blow to Slavonic idolatry, mission work was carried on with but partial success; and it taxed all the energies of Adalbert, bishop of Bremen, of Vielcin, bishop of Oldenburg, of Bishop Otto of Bamberg the apostle of the Pomeranians, of Adalbert the martyr-apostle of Prussia, to spread the word in that country, in Lithuania, and in the territory of the Wends. It was not till 1168 that the gigantic four-headed image of Swantevit was destroyed at Arcora, the capital of the island of Rügen, and this Mona of Slavonic superstition was included in the advancing circle of Christian...
civilization. As late as 1230 human sacrifices were still being offered up in Prussia and Lithuania, and, in spite of all the efforts of the Teutonic Knights, idolatrous practices still lingered amongst the people, while amongst the Lapps, though successful missions had been inaugurated as early as 1335, Christianity cannot be said to have become the dominant religion till at least two centuries later.

(c) Moslem Missions.—The mention of the order of the Teutonic Knights reminds us how the crusading spirit had affected Christendom. Still even then Raimon Lull protested against propaganda by the sword, urged the necessity of missions amongst the Moslems, and sealed his testimony with his blood outside the gates of Bugia in northern Africa (June 30, 1315). Out of the crusades, however, arose other efforts to develop the work which Nestorian missionaries from Bagdad, Edessa and Nisibis had already inaugurated along the Malabar coast, in the island of Ceylon, and in the neighbourhood of the Caspian Sea. In 1245 the Roman pontiff sent two embassies—one, a party of four Dominicans, sought the commander-in-chief of the Mongol forces in Persia; the second, consisting of Franciscans, made their way into Tartary, and sought to convert the successor of Oktai-Khan. Their exertions were seconded in 1253 by the labours of another Franciscan whom Louis IX. of France sent forth from Cyprus.1 While in 1274 the celebrated Polycarp, succeeded by two learned Dominicans, visited the court of Kublai-Khan, and at the commencement of the 14th century two Franciscans penetrated as far as Peking, even translating the New Testament and the Psalter into the Tartar language, and training youths for a native ministry.2

(f) Missions to India and the New World.—These tentative missions were now to be supplemented by others on a larger scale. In 1488 the Cape of Good Hope was rounded by Diaz, and in 1508 the foundations of the Portuguese Indian empire were laid by Albuquerque. Columbus also in 1492 had landed on San Salvador, and the voyages of the Venetian Cabot along the coast of North America opened up a new world to missionary enterprise. Thus a grand opportunity was given to the churches of Portugal and Spain. But the zeal of the Portuguese took too often a one-sided direction, repressing the Syrian Christians on the Malabar coast, and interfering with the Abyssinian Church,3 while the fanatic temper of the Spaniard consigned, in Mexico and Peru, multitudes who would not renounce their heathen errors to indiscriminate massacre or abject slavery.4 Las Casas has drawn a terrible picture of the oppression he strove in vain to prevent.5 Some steps indeed were taken for disseminating Christian principles, and the pope had induced a band of missionaries, chiefly of the mendicant orders, to go forth to this new mission field.6 But only five bishops had been established by 1520, and the number of genuine converts was small. However, every vestige of the Aztec worship was banished from the Spanish settlements.

(g) The Jesuit Missions.—It was during this period that the Jesuits came into existence. One of the first of Loyola's associates, Francis Xavier, encouraged by the joint-cooperation of the pope and of John III. of Portugal, disembarked at Goa on the 6th of May 1542, and before his death on the Isle of St John (Hiang-Shang), on the 2nd of December 1552, roused the European Christians of Goa to a new life, laboured with singular success amongst the Paravars, a fisher caste near Cape Comorin, gathered many converts in the kingdom of Travancore, visited Malacca, and founded a mission in Japan. The successor of Xavier, Antonio Criminalis, was regarded by the Jesuits as the first martyr of their society (1562). Matteo Ricci, an Italian by birth, was also an indefatigable missionary in China for twenty-seven years, while the unholy compromise

with Brahminism in India followed by Robert de' Nebili was fatal to the vitality of his own and other missions. Others of the same order evangelized Paraguay in 1582, while the Huguenots sent forth under a French knight of Malta a body of devoted men to attempt the formation of a Christian colony at Rio Janeiro. By the close of the 16th century a committee of cardinals was appointed under the name of the "Congregatio de propaganda fide," to give unity and solidarity to the work of missions. The scheme originated with Gregory XIII., but was not fully organized till forty years afterwards, when Gregory XV. gave it plenary authority by a bull dated the 2nd of June 1622. Gregory's successor, Urban VIII., supplemented the establishment of the congregation by founding a great missionary college, where Europeans might be trained for foreign labours, and natives might be educated to undertake mission work. At this college is the missionary printing-press of the Roman Church, and its library contains an unrivalled collection of literary treasures bearing on the work.

MODERN MISSIONS

Missionary Societies.—Modern missionary activity is distinguished in a special degree by the exertions of societies for the development of mission work. Some of these, sustained with the colossal display of power on the part of the Church of Rome, it must be allowed that the churches which in the 16th century broke off from their allegiance to the Latin centre at first showed no great anxiety for the extension of the gospel and the salvation of the heathen. The causes of this are not far to seek. The isolation of the Teutonic churches from the vast system with which they had been bound up, the conflicts and troubles among themselves, the necessity of fixing their own principles and defining their own rights, concentrated their attention upon themselves and their own home work, to the neglect of work abroad.8

Still the development of the maritime power of England, which the Portuguese and Spanish monarchies noted with fear and jealousy, was distinguished by a singular anxiety for the spread of the Christian faith. Edward VI. in his instructions to the navigators in Sir Hugh Willoughby's fleet, Sebastian Cabot in those for the direction of the intended voyage to Cathay, and Richard Hakluyt, who promoted many voyages of discovery in addition to writing their history, agree with Sir Humphrey Gilbert's chronicle that "the sowing of Christianity must be the chief intent of such as shall make any attempt at foreign discovery, or else whatever is builded upon other foundation shall never obtain happy success or continuance." When on the last day of the year 1600 Queen Elizabeth granted a charter to George, earl of Cumberland, and other "adventurers," to be a body-corporate by the name of "The Governor and Company of Merchants of London trading with the East Indies," the expressed recognition of higher duties than those of commerce may by some be deemed a mere matter of form, and, to use the words of Bacon, "what was first in God's providence was but second in man's appetite and intention." Yet a keen sense of missionary duty marks many of the chronicles of English mariners. Notably was this the case with the establishment of the first English colony in America, that of Virginia, by Sir Walter Raleigh. The philosopher Thomas Harriot (1560-1621), one of his colleagues, laboured for the conversion of the natives, amongst whom the first baptism is recorded to have taken place on the 13th of August 1587.9 Raleigh himself presented as a parting gift to the Virginia Company the sum of £100 "for the propagation of the Christian religion" in that settlement.10 When James I. granted letters patent for the occupation of Virginia it was directed that the "word and service of God be preached,

We must not, however, overlook the remarkable appeal made by Erasmus in the first book of his treatise on the art of preaching (Ecclesiastes sive concinator evangelicis). The salient passages are quoted in G. Smith, Short History of Christian Missions, pp. 116-118; Gustavus Vasa in 1539 made an effort to educate and evangelize the Lapps.

planted and used as well in the said colonies as also as much as might be among the savages bordering among them,” and the honored names of Nicolas Ferrar, John Ferrar, John Donne and Sir John Sandys, a pupil of Hooker, are all found on the council by which the home management of the colony was conducted.

In the year 1618 was published The True Honour of Navigation and Navigators, by John Wood, D.D., dedicated to Sir Thomas Smith, governor to the East India Company, and about the same time appeared the well-known treatise of Hugo Grotius, De veritate religionis christianae, written for the express use of settlers in distant lands. Grotius also persuaded seven law students of Lübeck to go to the East as missionaries; the best known of them was Peter Heiling, who worked for 20 years in Abyssinia. A good deal of work was done by Dutch evangelists in Java, the Moluccas, Formosa and Ceylon, but it was not permanent.

The wants, moreover, of the North American colonies did not escape the attention of Archbishop Laud during his official connexion with them as bishop of London, and he was developing a plan for promoting a local episcopate there when his troubles began and his scheme was interrupted. During the Protectorate, in 1662, an ordinance was passed for the promoting and propagating the Gospel in New England by the creation of a corporation, to be called by the name of the President and Society for the Propagation of the Gospel in New England, to receive and dispose of moneys for the purpose, and a general collection was ordered to be made in all the parishes of England and Wales; and Cromwell himself devised a scheme for setting up a council for the Protestant religion, which should rival the Roman Propaganda, and consist of seven councilors and four secretaries for different provinces. On the restoration of the monarchy, through the influence of Richard Baxter with Lord Chancellor Hyde, the charter already granted by Cromwell was renewed, and its powers were enlarged. For now the corporation was styled “The Propagation of the Gospel in New England and the parts adjacent in America,” and its object was defined to be “not only to seek the outward welfare and prosperity of those colonies, but more especially to endeavour the good and salvation of their immortal souls, and the publishing the most glorious gospel of Christ among them.” On the list of the corporation the first name is that of Charles Lyttelton, while the Hon. Robert Boyle was appointed a secretary. Among the most eminent of its missionaries was the celebrated John Eliot, the Puritan minister of Roxbury, Massachusetts, who, encouraged and financially assisted by Boyle, brought out the Bible in the Indian language in 1661–1664. Boyle displayed in other ways his zeal for the cause of missions. He contributed to the expense of printing and publishing at Oxford the four Gospels and the Acts of the Apostles in the Malay language, and at his death left £500 for the propagation of the gospel in heathen lands.

The needs of the colonial church soon excited the attention of others. George Fox, the Quaker, wrote to “All Friends everywhere that have Indians or blacks, to preach the Gospel to them and their servants.” Great efforts were made by William Beveridge (1637–1708), bishop of St Asaph, William Wake (1637–1732), archbishop of Canterbury, John Sharp (1645–1714), archbishop of York, Edmund Gibson (1669–1748), bishop of London, and afterwards by the philosophic Bishop Berkeley, and Bishop Butler, the famous author of the Analogy, to develop the colonial church and provide for the wants of the Indian tribes. In 1669 the first bishop of Maryland, selected by the bishop of London as ecclesiastical commissary; and, having sold his effects, and raised money on credit, he sailed for Maryland in 1669, where he promoted, in various ways, the interests of the Church. Returning to England in 1700–1701, and supported by all the weight of Archbishop Tenison and Henry Compton, bishop of London, he was graciously received by William III., and received letters patent under the great seal of England for creating a corporation by the name of the “Society for the Propagation of the Gospel in Foreign Parts,” on the 16th of June 1701.

Meanwhile, in 1664, Von Velz, an Austrian baron, issued a stirring appeal to the Church at large for a special association devoted to extending the evangelical religion and converting the heathen. He was told that each Christian country should be responsible for its non-Christian neighbours, e.g., the Greeks for the Turks, and that as for the heathen it was no good casting pearls before swine. Finding no better response, he went himself as a missionary to Dutch Guiana. The opening of the 18th century saw other movements set on foot. Thus in 1705 Frederick IV. of Denmark founded a mission on the Coromandel coast, and inaugurated the labours of Bartholomew Ziegenbalg, Henry Plutschau and C. F. Schwartz, whose devotion and success told with such remarkable reflex influence on the Church at home. Again in 1731 the Moravians (q.v.) illustrated in a signal degree the growing consciousness of obligation towards the heathen. Driven by persecution from Moravia, hunted into mountain-caves and forests, they had scarcely secured a place of refuge in Saxonay before, though a mere handful in numbers, yet with the spirit of men banded for daring and righteous deeds, they reformed the faith and planted churches in the dominion of the heathen, before God, of bearing the gospel to the savage and perishing tribes of Greenland and the West Indies, of whose condition report had brought a mournful rumour to their ears.” And so, literally with “neither bread nor scrip,” they went forth on their pilgrimage, and, incredible as it sounds, within ten years they had established missions in the islands of the West Indies, in South America, Surinam, Greenland, among the North American tribes, in Lapland, Tartary, Algiers, Guinea, the Cape of Good Hope and Ceylon. Up till this time all missionary enterprises had been more or less connected with the state. The era of modern missions, based on associate organizations, begins with William Carey (q.v.), and is closely connected with the great evangelical revival of the latter part of the 18th century. That revival had intensified the idea of the worth of the individual soul, whether Christian or heathen, and “to snatch even one brand from the burning” became a dominant impulse. In 1792, Carey, a Baptist, who was not only a cobbler, but a linguist of the highest order, a botanist and zoologist, published his Enquiry into the Principles of Christianity and Christian Missions on the Topography of the Heavens, and the book marks a distinct point of departure in the history of Christianity. Under its influence twelve ministers at Kettering in October 1792 organized the Baptist Society for Propagating the Gospel among the Heathen, and subscribed £13, 2s. 6d. In June 1793 Carey was on his way to India. Letters from him quickened interest outside his own communion, and in the autumn of 1794 a meeting of Evangelical ministers of all denominations resolved to appeal to their churches, especially with a view to work being started in the South Sea Islands. The chief movers in the enterprise were the Congregationalist, David Bogue of Gosport, and the Episcopalian, Thomas Hawes, rector of Aldwinkle, Northamptonshire. With them were associated Wesleyan and Presbyterian divines, and in September 1795 the London Missionary Society, emphasizing no one form of church government, was formed. £10,000 was subscribed by June 1796, and in August 29 missionaries sailed for Tahiti. Societies formed in Glasgow and Edinburgh in the spring of the same year gave their attention to the continent of Africa.

The need of this continent was also the means of creating the American Missionary Association and the Church Missionary Society. The evangelical movement had produced philanthropists like Wilberforce and Granville Sharp, and the Ecclectic Society, a group of clergy and laymen who fell to discussing the new missionary movements. In April 1799, under the guidance of John Venn and Thomas Scott, was established the Church Missionary Society, originally known as the “Society for Missions to Africa and the East.” Its promoters declared their intention of maintaining cordial relations with Nonconformist

MISSIONS

MISSIONS

missionary societies, and this has largely been done, the older Society for the Propagation of the Gospel, manned by "High" Churchmen, standing more aloof. In 1814 the Wesleyan Missionary Society was formed, Methodist effort of this kind having previously been left to the individual enterprise of Dr Thomas Coke. Thus shorn of two chief bodies of supporters, and Presbyterians in England being then comparatively few, the London Missionary Society became in effect a Congregationalist organization, though it has never departed from the broad spirit of its founders. In Scotland Robert Haldane sold his estate and devoted £25,000 to the cause; with others he would have gone to India himself but for the prohibition of the East India Company, one of whose directors said he would rather see a band of devils in India than a band of missionaries. What Carey did for England was largely done for Scotland by Alexander Duff, who settled in Calcutta in 1830, and was a pioneer of higher education in India. On the Continent the Basel Mission (1815) grew out of a society founded in 1780 to discuss the general condition of Christianity; "Father" Jänicke, a Bohemian preacher in Berlin, founded a training school which supplied many men to the Church Missionary Society and the London Missionary Society; and Van der Kemp, who pioneered the London Missionary Society work in South Africa, organized in 1797 the Netherland Missionary Society, which turned its attention chiefly to Dutch Colonial possessions.

In America as in England the sense of individual responsibility had been developed. In 1766 and 1797 respectively the New York and the Northern societies were formed for work among Indians by Presbyterians, Baptists and Reformed Dutch, acting in concert. News of the London Society stimulated interest in New England, and in 1860 Andover Seminary was founded as a missionary training college. In the same year Samuel J. Mills, Gordon Hall and James Richards, three students at Williams College, Massachusetts, formed themselves into a mission band which ultimately became the American Board of Commissioners for Foreign Missions (June 1810), an organization which, like the London Mission, originally undenominational and still catholic, has become practically Congregational. The first of all from it was the American Baptist Missionary Union in 1814.

The following chronological lists illustrate the growth of missionary societies in Britain and the United States:

Great Britain and Ireland.

1791. Christian Faith Society for the West Indies.
1798. Society for Promoting Christian Knowledge.
1701. Society for the Propagation of the Gospel in Foreign Parts.
1732. Moravian Mission.
1792. Baptist Missionary Society.
1796. Scottish Missionary Society.
1799. Church Missionary Society.
1804. British and Foreign Bible Society.
1806. London Society for Promoting Christianity among the Jews.
1813. Wesleyan Missionary Society.
1817. General Baptist Missionary Society.
1823. Colonial and Contintental Church Society.
1825. Church of Scotland Mission Boards.
1831. National Bible Society of Scotland.
1831. Trinitarian Bible Society.
1832. Wesleyan Ladies' Auxiliary for Female Education in Foreign Countries.
1840. Irish Presbyterian Missionary Society.
1840. Welsh Calvinistic Methodist Missionary Society.
1841. Colonial Bishopric Fund.
1843. Free Church of Scotland Mission.
1844. South American Missionary Society.
1847. Presbyterian Church in England Foreign Missions.
1855. Christian Vernacular Education Society for India.

1866. Delhi Female Medical Mission.
1867. Friends' Mission in Syria and Palestine.
1876. Cambridge Mission to Delhi.
1884. Presbyterian Mission to Korea.
1892. Student Volunteer Missionary Union.

1878. Society for Propagating the Gospel among the Indians at Boston.
1879. Friends' Missionary Society.
1883. United States Mission to the Cherokee.
1886. Western Missionary Society for Indians.
1890. Board of Commissioners for Foreign Missions.
1891. Methodist Episcopal Church Missionary Society.
1833. Free-will Baptist Foreign Missionary Society in India.
1835. Foreign Missions of the Protestant Episcopal Church.
1887. Foreign Missions of the Presbyterian Church (North).
1837. Evangelical Lutheran Foreign Missionary Society.
1842. Seventh Day Baptist Missionary Society.
1845. Methodist Episcopal Church (South).
1845. Southern Baptist Convention.
1849. Board of Foreign Missions of (Dutch) Reformed Church.
1850. Board of Foreign Missions of United Presbyterian Church.
1862. Board of Foreign Missions of the Presbyterian Church (South).
1878. Evangelical Association Missionary Society.
1886. Student Volunteer Missionary Society.

It is not possible to follow in detail the history of the hundred or more organized societies of some size that have thus come into being since the end of the 18th century, still less that of the three or four hundred smaller agencies.1 It may be noted, however, that the entrance of these later agencies followed certain definite laws, and their development is traceable in other lands. In Germany the Rhenish Society (1825) became independent of the Basel Mission, but like it the Berlin Society founded by Neander and Tholuck has preserved a broad basis and includes both Lutheran and Reformed constituents. The North German or Bremen Society split into a strict Lutheran or Leipzig agency and the Hermannsburg Mission, which aimed at a more primitive and apostolic method. In Denmark, the Danish Missionary Society, founded by Pastor Bone Falch in 1821, worked through the Moravian and Basel societies until 1862, when it began independent work and concentrated on the Tamil population of South India. In Norway and Sweden missionary activity kept pace with the development of the national life; in the former country the Free Church, in the latter the State Church has been the most successful agency.

In Holland a religious revival in 1846 led to the foundation of several organizations which supplemented the work of the original Dutch Missionary Society. In France protestant missionary effort began after the overthrow of the empire, and in 1822 several isolated committees united to form the Société des Missions Évangéliques, better known as the Paris Evangelical Society. In Tahiti, Macao, and other islands this society has largely taken over work begun by the London Society, whose operations were viewed with suspicion by the French government.

1. The Denominational.—The course of denominational work may be followed in the way in which the London Society Board was gradually left to the Congregationalists, it being recognized that while fraternity was maintained, the widest results could only be obtained as appeal was made directly to the members of each separate denomination, to some extent a similar development is traceable in other lands. In Germany the Rhenish Society (1825) became independent of the Basel Mission, but like it the Berlin Society founded by Neander and Tholuck has preserved a broad basis and includes both Lutheran and Reformed constituents. The North German or Bremen Society split into a strict Lutheran or Leipzig agency and the Hermannsburg Mission, which aimed at a more primitive and apostolic method. In Denmark, the Danish Missionary Society, founded by Pastor Bone Falch in 1821, worked through the Moravian and Basel societies until 1862, when it began independent work and concentrated on the Tamil population of South India. In Norway and Sweden missionary activity kept pace with the development of the national life; in the former country the Free Church, in the latter the State Church has been the most successful agency.

Mission; and similar undenominational societies, e.g., the Regions Beyond Missionary Union in England, and the Christian and Missionary Alliance in America, have since been founded. Other individual enterprises have been launched by persons or single churches, but such have not usually flourished for any length of time, their workers gradually attaching themselves to the larger associations.

Protestant Missions.—It is generally agreed that the period since 1885 has witnessed a very marked increase of missionary zeal and interest in Great Britain, both in the Church of England and among the Nonconformists. The improvement, indeed, dates back somewhat earlier. So far as the Church of England is concerned it may fairly be said that there has been a larger number of Missions started in the following the first observance of the Day of Intercession for Missions, on the 20th of December 1872. Both the Society for the Propagation of the Gospel and the Church Missionary Society were at that time suffering from a general coldness which, in the case of the latter society, had led in that very year to the committee reporting “a failing treasury and a scanty supply of men.” The observance of that first Day of Intercession was followed by an immediate change, and unquestionably there has been progress ever since. Then, less than five months afterwards, David Livingstone died at Iola; and no event of the whole century did so much to wake up Protestant Christendom. Most of the missions in Central Africa for the Propagation of the Gospel in Africa and the Foreign Missions 1885 was also an epoch to be marked. In that year Bishop Hannington went to Africa; and his murder in 1885 (first reported in England on New Year’s Day, 1886) deeply touched the Christian conscience. The speedy publication of E. C. Dawson’s biography of him worked a revolution in the circulation of missionary literature. Another event of 1884–1885 was the going forth of “The Cambridge Seven,” in connexion with the China Inland Mission. All were men of good family; some of them went at their own charges; and among them were the stroke-oar of the University Eight (Mr Stanley Smith) and the captain of the University Eleven (Mr C. Studd). Probably no event of recent years has exercised a wider influence in the cause of missions. In particular, university graduates have since then gone out as missionaries in much larger numbers than before. There are now five missions definitely linked with the universities. The Central African Mission (1858), indeed, is not for the most part manned by graduates, though it is led by them; but the Cambridge Mission at Delhi (1878), the Oxford Mission at Calcutta (1880), and the Dublin Mission in Chota Nagpur (Society for the Propagation of the Gospel in Africa and the Foreign Missions, 1887) consist of university men. Moreover, the older and larger societies have much increased the proportion of graduates on their staffs.

The cause of missions in the universities has been fostered greatly by the Student Volunteer Missionary Movement, initiated in America in 1886, and organized in England in 1892. The Union has over 3000 members (of whom 1400 have gone to the field), and has adopted as its watchword, “The Evangelization of the World in this Generation”; and this motto has been approved by several bishops and other Christian leaders. Another influence upon university men and others who have taken holy orders is that of the Younger Clergy Union of the Church Missionary Society (1885) and the Junior Clergy Association of the Society for the Propagation of the Gospel (1891). At the same time there has been a great accession of men to the missionary ranks from among other classes of society. The Anglican societies and the regular and older Nonconformist societies (Methodist, Baptist, Presbyterian and the London Missionary Society, which is virtually Congregationalists) have shared in these humble recruits; but a large proportion of them have joined several younger “non-denominational” or “inter-denominational” missions. Of these the China Inland Mission is the largest and most influential; and while it has sent forth many of this class, it has also enrolled not a few men and women of considerable wealth, education and social status. The South Africa General Mission, the North Africa Mission, and the Congo Balolo Mission come next in importance; but there are several smaller bodies working in different countries. The Salvation Army also has missions in India, Ceylon and Japan; but these cannot be called “non-denominational,” because the Army has gradually become a very strict denomination itself. There is also the Anglican society working, like some of those mentioned, in one particular field, viz. the South American Missionary Society, founded in 1844. Many foreign dioceses also have associations in England for their help and support. Medical men have come forward in increasing numbers for missionary service, and medical missions are now regarded as a very important branch of the work of evangelization. They are especially valuable in Mahomedan countries, where open preaching is difficult and sometimes impossible, and also in works of mercy among barbarous tribes; while in China, which comes under neither of these two categories, they have been largely developed. There are 980 doctors (most of them fully qualified) labouring in British and American missions; and in 1910 it was calculated that the in-patients in mission hospitals exceeded 160,000, while the visits of out-patients in a year were about 5,000,000. In several of the great London hospitals there are missionary associations, the members of which are medical students; but a chief source of supply in the past has been the Edinburgh Medical Mission, founded in 1841, which, while working among the poor in that city, has trained many young doctors, now in the field.

The most remarkable development of missionary enterprise has been the employment of women. From an early date many of the wives of missionaries have done good service; but the going forth of single women in any appreciable number has only been encouraged by the societies in the last quarter of the 19th century. The Society for Promoting Female Education in the East (now absorbed by others, chiefly by the Church Missionary Society) was founded in 1834; the Scottish Ladies’ Association for the Advancement of Female Education in India (which subsequently became two associations, for more general work, in connexion with the Established and Free Churches of Scotland respectively) in 1837; the Indian Female Normal School Society (now the Zenana Bible and Medical Mission) in 1861 (taking over an association dating from 1852); the Wesleyan Ladies’ Auxiliary in 1859; the Women’s Association for the Propagation of the Gospel, and the Baptist Zenana Mission, in 1867; The London Society’s Female Branch, in 1875; the Church of England Zenana Society (an offshoot from the Indian Female Society) in 1886. But the earlier of these organisations, representing a contemplative mission for women, has as its educational work on a very small scale. Out of it grows the work of the various Zenana societies. The employment of women in general evangelistic work, such as village itineration, house-to-house visiting in towns, classes for female inquirers, training of native female workers, &c., although recent, has rapidly extended. The Church Missionary Society, besides relying on the above-named Zenana Bible and Medical Mission and Church of England Zenana Missionary Society for women’s work at several of its stations in India and China, sent out 500 single women in the fifteen years ending 1900; and the non-denominational missions above referred to have (including wives) more women than men engaged in their work—especially the China Inland Mission, which has sent out several hundreds to China. Women’s work and medical work are combined in the persons of nearly 500 fully-qualified lady doctors in various missions. Although nearly half the male missionaries (Protestant) are unmarried, these are exceeded in number by the unmarried women; and consequently, the husbands and wives being equal, the aggregate of men in the Missions is greater than the aggregate of men.

The home organization of missions is a subject that has been much considered. The bulk of the work has been done by voluntary societies, membership in which depends upon a pecuniary subscription, and the administration of which is entrusted to elected committees. These committees comprise not only real experts, such as retired veteran missionaries, and retired civil and military officers who have been active friends of missions while on foreign service, but also leading clergymen and laymen
who, though not personally acquainted with the mission fields, become almost equal experts by continuous attendance and careful study. In the case of the two leading Church of England societies, the bishops (being members) are ex officio on all executive committees; but their labours in other directions prevent their ordinarily attending. The numerous non-denominational missions previously referred to are differently worked. There is no membership by subscription, nor any elected committee. The "mission" consists of the missionaries themselves, and they are governed by a "director," with possibly small advisory councils in the field and at home, the latter undertaking the duty of engaging missionaries and raising funds.

On the other hand, there is a growing sense that missions should be the work of the Church in its corporate capacity, and not of voluntary associations. This is the system of the Presbyterian Churches, the missions of which are entirely controlled by the General Assemblies in Edinburgh, Belfast, and London respectively. The Wesleyan Society also is under the authority of the Conference. In the Church of England, the question was broached in Convocation, shortly after the revival of that body, in 1859; and during the last few years many suggestions were put forth for the establishment of a Board of Missions which should control the work, or at least direct their work. It soon appeared, however, that neither the Society for the Propagation of the Gospel nor the Church Missionary Society was willing to be absorbed; and it was urged by some that in a great comprehensive national Church, comprising persons of widely different views, more zeal was likely be thrown into voluntary than into official enterprises. Eventually, in 1887, the Canterbury Convocation and Archbishop Benson formed a Board of Missions; and York followed shortly afterwards. These boards, however, were not to supersede the societies, but to supplement their work, by collecting information, fostering interest, registering results and acting as referees when required. They have already done some useful work, and will probably do more. Their most active members are men who are also leaders in their respective societies, and have thus gained experience in missionary administration. But the Church of England has not yet put missions in the prominent place they occupy in the Nonconformist denominations.

The closing years of the 19th century were remarkable for the centenary commemorations of the older missionary societies. The Basel Society celebrated its centenary in 1892; the London Missionary Society (Congregational) did the same in 1895; the Society for Promoting Christian Knowledge kept its bicentenary in 1898; the Church Missionary Society its centenary in 1899; the Society for the Propagation of the Gospel its bicentenary in 1900-1901; and the British and Foreign Bible Society its centenary in 1904. Considerable special funds have been raised in connexion with these commemorations. A good deal of interest has also been awakened and maintained by missionary exhibitions, and by a more intelligent type of missionary literature.

Colonial missions now claim attention. By "colonial" is meant, not missions to the British colonial population, but missions from the colonial population to the heathen. The former have been largely the work of the Society for the Propagation of the Gospel, and, in a smaller degree, of the Colonial Church Society (Church of England) and the Colonial Missionary Society (Congregational). Those missions, however, are more properly an outlying branch of these missions, being the result of Christian settlers or their descendants. But these Christian settlers have their own missions to the heathen—both to the heathen at their doors and to the great heathen lands beyond.

In Canada and Australia, the Anglican, Presbyterian, Methodist, Baptist and other communities have regular organizations for foreign missions. The non-episcopal missions thus formed and supported are worked quite independently of the home societies of the denominations respectively. The Australian Presbyterians have important agencies in the South Seas and in Korea, the Australian Baptists in Bengal, the Canadians of various denominations in the Far North-West of the Dominion, and in India and China. The Anglican Church in Canada has its Domestic and Foreign Missionary Society, working in the North-West and in Japan; and in Australia it has a Board of Missions, working amongst the Australian aborigines and in New Guinea. The Melanesian Mission, associated with the names of Selwyn and Patteson, is officially connected with the Church of New Zealand, but is also largely supported in Australia. In New South Wales, Victoria, New Zealand and Canada there are also Church missionary associations which supply missionaries, and support them, for the mission fields of the Church Missionary Society.

The German societies are numerous and important, and have increased in number and in vigorous work. The Moravian Church, whose missions are the oldest (1732), is itself a missionary organization in a sense in which no other Christian community rivals it. Its total membership is under 100,000, and it has some 350 missionaries, labouring in the most unpromising fields—Greenland, Labrador, Alaska, Central America, Tibet, and among the Hottentots. The Basel Society, with its famous seminary at Basel, which formerly supplied many able German missionaries to the Church Missionary Society, are, as in England, in Africa and South China. The Berlin Society and the Rheinische Mission Society labour in South Africa and China, the Hermannsburg Mission (Hanover) in South Africa and India; Gossner's Mission (Berlin) and the Leipzig Lutherans in India. At least two of these societies, and other new associations formed for the purpose, and the Moravians, have taken up work in German East Africa. The principal organizations in Holland are the Netherlands Missionary Society and the Utrecht Missionary Society, working mainly in the Dutch colonies. A Danish society has a mission in South India. The old Swedish and Norwegian missionary societies work in South Africa, Madagascar and India; but large numbers of Scandinavians have been stirred up in missionary zeal, and have gone out to China in connexion with the China Inland Mission; several were massacred in the Boxer outbreaks. The French Protestants support the Société des Missions Évangéliques, founded in 1822. Its chief mission has been in Basutoland, since extended to the Zambesi; but it has also followed French colonial extension, establishing missions in Somaliland, the French Congo, Madagascar and Tahiti.

The newer American organizations are, in England, non-denominational and "free-lance," especially the Christian and Missionary Alliance (1897), developed from the American International Missionary Alliance (1887), which has sent many missionaries to India and China. The older societies attribute to these new agencies more zeal than discretion, while the newer credit the older with a discretion that cripples zeal. The Student Volunteer Movement, already referred to, has had large influence in the United States, where it arose; and its leaders have proved themselves men of rare intellectual and practical capacity. In a journey round the world in 1895-1897, J. R. Mott succeeded in forming students' associations in universities and colleges in several European countries, as well as in Turkey in Asia, Syria, India, Ceylon, China, Japan and Australia; and all these associations, over 150 in number, are now linked together in a great International Student Federation. The older American societies, especially the American Board (Congregational), the Presbyterian, the Methodist Episcopal Church Society, the Baptist Missionary Union, and the Missionary Society of the Protestant Episcopal Church, have much extended their work. The "Ecumenical Missionary Conference," held at New York in April 1900, was an astonishing revelation to the American public of the greatness of missions generally and of the missions of their own churches in particular. The Laymen's Missionary movement is a significant outcome of the interest then awakened.

Missions to the Jews are worked by distinct organizations. There are several societies in England, Scotland, Germany and America. No special development has to be reported, except the great extension of John Wilkinson's Midday Mission to
the Jews, and its energy in the free distribution of Hebrew New Testaments. Converted Jews are commonly supposed to be very few, and in numbers they do not compare with converted heathen; but they are more numerous than is usually imagined, especially if the second and third generations of Christians of Hebrew race are included. A number of them find in Unitarianism a form of Christianity that appeals to them. It is estimated that 250 Anglican clergymen are converted Jews or the sons of converted Jews. The London Society for Promoting Christianity among the Jews includes among its missionaries about 80 who are converts. Professor Delitzsch estimated that 100,000 Jews had embraced Christianity in the first three quarters of the 19th century; and Dr Dalman of Leipzig says that "if all those who have entered the Church and their descendants had remained together, instead of losing themselves among the other peoples, there would now be a believing Israel to be counted by millions, and no one would have ventured to speak of the uselessness of preaching the Gospel to the Jews."

Interesting as is the story of Protestant mission work in Austria, Spain, Italy and Russia, it does not fall within the scope of this article. Nor do the proselytizing enterprises of Seventh-Day Adventists, Mormons and other American bodies rightly find a place here.

Roman Catholic Missions.—At the beginning of the 19th century the Roman Communion seems to have shared to some extent in the torpor and stagnation as regards missions that characterized the Protestant churches. There was little of the zeal which had carried the Franciscans all over Asia in the 13th century, and the Jesuits to South America, India and Japan in the 18th. But the 19th century witnessed a great change, and Roman Catholic missions have been extended pari passu with Protestant. The renewal was not a little due to the foundation in 1822, by a few earnest but (as they called themselves) "humble and obscure" Catholics at Lyons, of a new voluntary society, called the Institution for the Propagation of the Faith. It collected in its first year about £2000 from the shopkeepers and artisans of Lyons. Thirty years later its income was £120,000 a year; and now it is £300,000. It has sent out no missionaries of its own. It merely makes grants to the various missionary parties sent forth, and it has done much in this direction. Roman missions are carried on both by missionary societies and by religious orders, all under the supreme direction of the pope, and also more or less under the general supervision of the Sacred Congregatio de Propaganda Fide at Rome since its foundation by Gregory XV. in 1622. This important congregation has been described as "the church in the Catholic Church" and as the colonial office in the British empire, and its head, the "Prefect of Propaganda," to the secretary of state for the colonies. It holds supreme control over all the foreign missions in heathen countries, and also over large and important parts of the church in Christian countries whose governments are not Catholic—including the British empire, the United States, Holland, the Norse kingdoms, Greece, and some parts of Germany and Switzerland. A special section (erected by Pius IX.) has charge of the affairs of all the Oriental rites in union with the Roman see. Confining our attention at present to the missions strictly understood under "foreign," i.e. to heathen or non-Christian countries, we shall find the whole of these parts of the globe carefully mapped and parcelled out by propaganda to a variety of missionary agencies or religious orders. The government of the various mission fields is generally carried on by "Vicars-Apostolic" (i.e. titular bishops acting as vicars or delegates of the Apostolic see) or "Prefects-Apostolic" (i.e. priests with similar powers, but without episcopal rank). In some few cases (notably India and Japan) a regular territorial hierarchy has been established, just as in the United Kingdom and the Netherlands. Of the religious societies engaged in the evangelization of these many fields of labour, some have been established exclusively for foreign missionary work among the heathen—notably the famous Société des Missions Étrangères de Paris, the oldest and greatest of all (dating from 1658, and consisting of 34 bishops, 1200 European missionaries and 700 native priests); the German "Society of the Divine Word," whose headquarters are at Steyl in Upper Austria, the Belgian Society of Scheut; the celebrated French Society of the "White Fathers," founded by the late Cardinal Lavigerie for African missions; the English Society of St. Joseph, founded at Mill Hill by Cardinal Vaughan; and some others. The other missions are entrusted to the care of various religious orders and congregations, which take up foreign missionary work in addition to their labours in Christian countries. Such are the Franciscans, Dominicans, Jesuits, Lazarists, Augustinians, Marists, &c. Besides the above orders of priests, an immense number of religious societies of women are engaged in works of education and charity throughout the whole of the foreign mission field. These have been reckoned at 42,000 European and 10,000 native sisters. Again, there are some 20 congregations of "Brothers" (not priests) engaged in teaching, and numbering some 4500 members.

By far the greater part of the Roman missionary work is done by France. The majority of the missionaries are French (over 7000); the bulk of the money—so far as it is voluntary contribution (but the propaganda at Rome has large endowments)—is raised in France. The French government, anti-clerical as it is at home, is the watchful and strenuous protector of the missions abroad; and it is evident that not a little political influence in foreign countries is gained thereby. L'Année de l'Eglise, in reporting on the missions in all parts of the world, dwells continually on this with satisfaction. Protestant missionary work is opposed, not merely because they are heretical, but because they are English or (if American) English-speaking; and the Greek Church missionaries in Persia and Japan, not only because they are schismatic, but because they are Russian—the Franco-Russian alliance notwithstanding. This is a feature in French Catholic missions which cannot be overlooked in the briefest account of them.

The following list shows the principal foreign Roman Catholic missionary societies and their fields of work:

I. Société des Missions Étrangères (Paris, 1668).—Missions: Manchuria, Korea, Tibet, Japan, China (Szechuan, Kui-Chow, Kwang-tong, Yunnan), Indo-China (W., S. and Upper Tongking, E., W. and N. Cochín-China, Cambodia, Siam), Malaya Peninsula, Burma (S. and N.), S. India (dioceses of Pondicherry, Kombakonam, Mysore, Coimbatore).

II. Society of "White Fathers" (founded by Cardinal Lavigerie, 1866).—Missions: Algeria, Sahara, Nyasa, Victoria Nyanza, Tanganyika, Uvuyenyembe, Upper Congo.

IV. Congregation of the Holy Ghost (1703 and 1848).—Missions: Senegambia, Gambia, Sierra Leone, Lower Niger, Gaboon, French Congo, Lower Congo, Mayotte, Nossibé and Comoro Islands.

V. Milan Seminary for Foreign Missions (1850).—Missions: China (Hong Kong, N. and S. Ho-nan), East Burma, India (dioceses of Kishnagar and Haidarabad).

VI. Sulpician Society of Foreign Missions (1747).—Missions: S. Shan-tung, China; Togo, W. Africa.

VII. Scheut Society of Foreign Missions (Belgium, 1863).—Missions: Mongolia, Kang-Su (China), Belgian Congo.

VIII. Pius XI. Society (Paris, 1817).—Missions: Hawaii, Tahiti, Marquesas Islands, X. Mill Hill Society (English, 1866).—Missions: N. Borneo and Labuan; N. Punjab, Kashmir and Ladak; Telugu missions of Madras; Maori missions of N. New Zealand; N. Island, etc.

IX. Congregation of the Sacred Heart (Issoudun, France, 1855).—Missions: New Guinea, New Pomerania, Gilbert Islands.

XI. Verona Society for African Missions.—Missions: The Sudan, Upper Egypt.

The following societies are engaged in home as well as foreign missions:

XII. Marists (French, 1816).—Missions: Fiji, Navigator’s Island, New Caledonia, Central Oceania, Solomon Islands, parts of New Zealand (dioceses of Wellington and Christchurch).

1 Father Damien belonged to this society, which takes its popular name from the Rue de Picpus, Paris.
MISSIONS

XIV. Lazarists (founded by St Vincent de Paul, 17th century).—Missions: Abyssinia, Persia, China (Peking or N. Chih-li, S.-W. Chih-li, Kiang-si, Che-Kiang), S. Madagascar.

XV. Oblates of Mary Immaculate (1840).—Missions: Ceylon (nearly all), S. Africa (Basutoland, Natal, Transvaal, Orange River Colony), the "Great North-West" of Canada (Athabasca-Mackenzie, Saskatchewan, St. Boniface, New Westminster).

XVI. Saredo (founded by Don Bosco).—Missions: Patagonia and Tierra del Fuego, Falkland Islands, Indians of S. America (Brazil, Argentina); some missions in Palestine.

XVII. Poulardi.—Missions: Cameroon, W. Africa; Australia (Bengale Bay, native settlement).

XVIII. Jesuits.—Missions: India (dioceses of Bombay, Poona, Calcutta, Madura, Mangalore, Trichinopoly), Ceylon (dioceses of Galle and Trincomalee), China (Kiang-nan, Kiang-si, Kiang-su), Koang (W. Africa), Zambezia, Jamaica, British Guiana, British Honduras, Alaska.

XIX. Dominicans.—Missions: Asiatic Turkey (Mosul), Tongking (N. and Central), China (Amoy, Fokien), Curaçao, Trinidad.

XX. Franciscans.—Missions: Egypt, Tripoli, Morocco, China (N. and S. Shan-si, N. and E. Shan-tung, N. Shen-si, E. N.-W. and S.-W. Hu-pe), Capuchins: Azen and Arab, India (dioceses of Agra, Allahabad, Lahore, S.-W. Bengal, Ceylon, Seychelles, Eritrea (Red Sea), Gallas, Cephalonia, Trebizond, Mardin, Crete, Caroline Islands, Araucania, Brazil, Bulgaria. Conventuals: Jassy (Rumania).

XXI. Benedictines.—Missions: Ceylon (diocese of Kandy), New Zealand (diocese of Auckland), S. N. American Indians (Indian Territory and Oklahoma), Australian natives (New Nuestra).

XXII. Trappists.—Missions: Settlements in Natal (Mariannhill, West African Congo), China, Japan.

XXIII. Augustinians.—Missions: Philippines, China (N. Hu-nan), Balkan Peninsula, Asia Minor ("Assumptionists").

XXIV. Carmelites.—Missions: Bagdad, India (dioceses of Verapoly and Quilon).

XXV. Redemptorists.—Missions: Dutch Guiana.

XXVI. Passionists.—Missions: Bulgaria (diocese of Nicopolis). These missions are largely supported by the Society of the Propagation of the Faith. Britain.

On figures given in H. A. Kroe's Catholic Missions statistik (1908), the following totals of Roman Catholic missions amongst non-Christians have been compiled: European priests, 7933; native priests, 5837; lay brothers, 5270; sisters, 21,320; catechists, 24,574; native membership, 7,441,215; catechumens, 1,577,909. The annual baptisms of adult heathen are 190,000; those of heathen children at the point of death, 450,000. Over 840,000 children are in lower schools, 66,000 in middle schools, and 90,000 in orphanages. The total number of schools is 24,000, of churches and chapels 28,000, and of mission stations 43,000.

Note.—Where figures for 1910 are quoted in this article they are really those of two or three years earlier, collected for the World Conference of 1910.

Orthodox Eastern Church.—When the tsar Ivan the Terrible (1533-1584) began the advance of Russia into Northern Asia, a large number of missionaries accompanied the troops, and during the 17th century many thousands of Tatars were baptized, though from lack of fostering influences they lapsed into heathenism. Very little was done until 1824, when John Veniaminov (d. 1879), a priest of Irkutsk, afterwards Archbishop Innocent, began a career of evangelistic activity which has few parallels. The scattered missions in Asia and the Caucasus, India, China, Japan, S.-W. Asia, and the Aleutian Islands, Kamchatka and throughout Eastern Siberia, are maintained by the Orthodox Missionary Society at Moscow. In Altai (Central Siberia) the Archimandrite Macarius, and among the Tatars in south-east Russia with headquarters at Kazan the great linguist Ilinsky, did similar work. In addition to the nine distinct missions (300 workers) in Siberia and the six (with 50 workers) in European Russia, the Orthodox Church (Russian) has three foreign missions: (1) in China, founded at Pekin 1714, in the face of Jesuit opposition; (2) in Japan, established about 1863 by Bishop Nicolai, a chaplain at Nagasaki; (3) in Alaska and the Aleutian Islands, the bishop residing at San Francisco and having jurisdiction also over members of the church settled in the United States of America. Altogether the Russian Church spends over £30,000 annually on these missions, and works with the British and Foreign Bible Society in translating and distributing the Scriptures. In Japan the mission has become a practically independent branch of the Church.

History of Mission Fields

The continuity of missionary enthusiasm maintained throughout the primitive, the medieval, and the modern periods of the Church's history, operating at every critical epoch, and surviving after periods of stagnation and depression, is a very significant fact. It is true that other religions have been called missionary religions, and that one of the long held first place in the religious census of mankind. The missionary activity of Buddhism is a thing of the past, and no characteristic rite distinguishing it has found its way into a second continent. Mahommedanism indeed is active, and is the chief opponent of Christianity to-day, but the character of its teaching is too exact a reflection of the race, time, place and climate in which it arose to admit of its becoming universal. It is difficult to trace the slightest probability of its harmonising with the intellectual, social and moral progress of the modern world. With all its deficiencies, the Christian church has gained the "nations of the future," and whereas in the 3rd century the proportion of Christians to the whole human race was only that of one in a hundred and fifty, this has now been exchanged for one in three, and it is indisputable that the progress of the human race at this moment is identified with the spread of the influence of the nations of Christendom.

Side by side with this continuity of missionary zeal, a noticeable feature is the immense influence of individual energy and the sublimating force of personal character. Around individuals penetrated with Christian zeal and self-denial has centred not merely the life, but the very existence of primitive, medieval and modern missions. What Ulfilas was to the Gothic tribes, that Columba and his disciples were to the early Celtic missions, what Augustine or Aidan was to the British Isles, what Boniface was to the churches of Germany and Anskar to those of Denmark and Sweden, that, on the discovery of a new world of missionary enterprise, was Xavier to India, Hans Egede to Greenland, Eliot to the Red Indians, Marty to the church of Cawnpore, Marsden to the Maoris, Carey, Heber, Wilson, Duff and Edwin Lewis to India, Morrison, Gilmour, Legge, Hill, Griffith John to China, Gray, Livingstone, Mackenzie, Moffat, Hannington, Mackay to Africa, Broughton to Australia, Patteson to Melanesia, Crowther to the Negro Territory, Chalmers to New Guinea, Brown to Fiji. At the most critical epochs such men have ever been raised up, and the reflex influence of their lives and self-denial has told upon the Church at home, while apart from their influence the entire history of important portions of the world's surface would have been altered.

If from the agents themselves we turn to the work that has been accomplished, it will not be disputed that the success of missions has been marked amongst rude and aboriginal tribes. What was true in the early missions has been found true in these latter times. The rude and barbarous northern peoples seem to fall like "full ripe fruit before the first breath of the gospel." The Goths and the Vandals who poured down upon the Roman Empire were evangelized so silently and rapidly that only a fact here and there relating to their conversion has been preserved. This is exactly analogous to modern experience in the South Seas, Asia and Africa, to a survey of which we now turn.

The South Seas.—Missionary work in the Pacific began with Magellan (1521), when in a fortnight he converted all the inhabitants of Cebu and the adjacent Philippine Islands! The Jesuits, Recollects and Augustinians also worked in Mariana, Pelew and Caroline Islands, though the two latter were soon abandoned. The beginning of modern effort was made by the London Missionary Society in 1797. 3

1 E. Stock's Short Handbook of Missions has a chapter on "Some Notable Missionaries" and another on "Some Prominent Native Christians."

2 Stock's Short Handbook of Missions has a chapter on "Some Notable Missionaries" and another on "Some Prominent Native Christians."

3 Stock's Short Handbook of Missions has a chapter on "Some Notable Missionaries" and another on "Some Prominent Native Christians."
Australia and New Zealand.—The earliest attempt to evangelize the aborigines of Australia by a separate mission was that of the Church Missionary Society in 1825. This work centered at Wellington Valley and Moreton Bay, but was given up in 1842. A new beginning was made in 1850 by the Anglican Board of Missions for Australia and Tasmania, and now each diocese is responsible for its own area. At Bellenden Ker, near Cairns, in North Queensland (diocese of Carpentaria), many natives have settled upon a reserve granted by government to the Anglican Church, and at another reserve, Fraser Island, the diocese of Brisbane has also undertaken successful work. Nomadic aborigines have hardly been touched. Apart from Queensland, most of the black population is in West Australia; here the Roman Catholic Church is the main evangelizing agency. In the north and central districts the German missions have been active. Both in Australia (especially in Sydney and Melbourne) and at Thursday Island there is work among the Chinese.

In Tasmania the aborigines are extinct, the last pure-blooded native dying in 1876. The half-castes settled in the Bass Straits are ministered to by the bishop of Tasmania. The Maoris of New Zealand have suffered from a loss of influence through the efforts of Samuel Marsden, a colonial chaplain in New South Wales about 1808. In 1822 Wesleyan missionaries reached the island. The first baptism was in 1825 but during the next five years there was a great mass movement. In 1840 the country became a British colony, and soon afterwards George Selwyn was consecrated bishop. He was so impressed with the work of native evangelists that he founded a college in Auckland where such teachers could be trained. In this he was helped by J. C. Patteson, and out of it grew the Melanesian Mission. The Maori rebellion, fomented by French Catholics, was an outbreak against everything foreign, and the strange religion Hau-hauism, a blend of Old Testament history, Roman Catholic dogmas, pagan rites and ventrilquism, found many adherents. Yet the normal missionary organization suffered very little. Later came Mormon missionaries, and these have to some extent further deplored the Christian ranks.

New Guinea.—In this large island some Gossner missionaries (1854) were the pioneers. They could not do much, but their successors, the Utrecht Missionary Union, who began work when the Dutch took possession of the north-west of the island, are making themselves felt through their stations. In German New Guinea the Neuendethausen (1886) and Rhenish (1887) Societies have fourteen stations. In British New Guinea, the south-east portion of the island, the London Mission (1871), the Australian Wesleyans (1892) and the Anglican Church of Australia (1892), have arranged a friendly division of the field and met with gratifying success. Work was begun in 1871-1872 when under the oversight of S. Macfarlane and A. W. Murray a number of native teachers from the Loyalty Islands Rarotonga and Mare settled on the island. The first converts were baptized in 1882 and the establishment of a British Protectorate (1884-1888) gave the work a new impetus. The name of W. G. Lawes and James Chalmers (who with O. Tompkins was killed by cannibals, 1901) of the London Missionary Society, and that of Maclaren, the Rhenish Missionary, are perpetually associated with Papua. The history of mission work here is one of exploration and peril amongst savage peoples, multitudinous languages and an adverse climate, but it has been marked by wise methods as well as enthusiastic devotion, industrial work being one of the basal principles. Besides the Protestant agencies already named, the Roman Catholic Order of the Sacred Heart has been working in the island since 1886; its centre is at Yule Island, and it works up the St. Joseph’s river.

Other Islands.—The London Mission ship “Duff” in 1767 landed eighteen missionaries (mainly artisans) at Tahiti, ten more in the Tonga or Friendly Islands, and one on the Marquesas. Those in Tahiti had a varying experience, and their numbers were much reduced, but in July 1812 King Pomare II. gave up his idols and sought baptism. By 1815 idolatry was abolished in the larger islands of the group and there ensued the task of building up a Christian community. Foremost in this work were William Ellis (q.v.) and John Williams (q.v.), who formed a native agency to carry the gospel to their fellow islanders, and so inaugurated what has since been a characteristic feature of South Sea Missions. In 1818 two Tahiti teachers settled in the Tonga islands, which the “Duff” pioneers had abandoned after half of them had been killed for a cannibal feast. When the Wesleyans came in 1821 the way had been prepared, and soon after, led by their king, George, the people turned to the new faith. About the same time Rurutu in the Australs Island and Aitutaki in the Cook Islands were evangelized, also by natives, and Christianity spread from island to island. John Williams himself removed in 1827 to Rarotonga and from there influenced Samoa, the Society Islands and Fiji. To Fiji in 1834 came James Calvert and other Wesleyan missionaries beginning a work which under them and their successors had extraordinary success. Williams met his death at Erromanga in 1839, but he had established a training school on Rarotonga, and bought a ship, the “Camen,” which was of the greatest service for the work. In 1841 work was begun in New Caledonia, in 1842 in the Loyalty Islands and in the New Hebrides, associated from 1857 with the memorable name of John G. Paton. In 1851 a teacher was placed on Niue, Savage Island, and in ten years it was evangelized. Meanwhile the original work in Tahiti had been taken over by missionaries of the Paris Society, though the last London Missionary Society agent did not leave that group till 1890. In 1861 Patterson was consecrated bishop of Melanesia, and the Auck land training school was removed to Norfolk Island. By arrangement with the Presbyterian the area of the mission includes the Northern New Hebrides, Banks, Torres, Santa Cruz and Solomon Islands. Patterson was murdered in 1871, a victim of the mistrust engendered in the natives by kidnapping traders. In 1877 John Selwyn was consecrated bishop. Wesleyan native evangelists from Fiji and Tonga carried Christianity in 1875 to the Bismarck Archipelago.

The solitary worker (W. F. Crook) on the Marquesas did not remain long, and after he went nothing was done till 1835-1844, when first some American and then some English missionaries arrived, but met with scant success and gave it up in 1841. Since 1845 teachers from the Hawaiian Islands have worked in the Marquesas, but results here have been less fruitful than anywhere else in the South Seas. In Hawaii itself much was accomplished by American missionaries, the first of whom were H. Bingham and A. Thurston (1820), and the most successful, Titus Coan, under whose leadership over 20,000 people were received into the churches between 1836 and 1839. Under the reign of Kalakaua (1874-1891) there was a strong reaction towards heathenism, but since the annexation of the islands by the United States of America the various churches of that land have taken up the task of evangelization and consolidation.

In the Micronesian Islands, while animism and tabu were strong, there was not the cannibalism of the southern islands. Work was begun in the Caroline Islands in 1852 and in time spread to the Gilbert and Marshall groups. In the Carolines and Marshalls it has now largely passed to German missionaries, the Americans having enough to do in the Philippines, where there are already over 100,000 Protestants.

The outstanding features of missionary work in the South Seas are (1) its remarkable success: cannibalism, human sacrifice and infanticide have been suppressed, civilization and trade have marvellously advanced; (2) the evangelical devotion of the natives themselves; (3) the need of continued European supervision, the natives being still in many ways little better than grown-up children.

Africa.—In Africa, as in the South Seas, mission work has gone hand in hand with geographical discovery. It is in every sense a modern field, or rather a collection of fields, varying in physical, racial, social and linguistic character. The unaccustomed conditions of life and the fatal influence of the climate have claimed as many victims here as did savagery in the Pacific.

Islands. The partition of the continent among the various European nations has been on the whole favourable to mission work. The nature of the task and of the results may be best approached by considering the different divisions—North, South, East, West and Central Africa.

North Africa, along the Mediterranean from Morocco to Egypt, is distinctly Mahomedan. To these regions came St. Louis and Raimon Lull, and one may in passing remember the strength of Christianity in Proconsular Africa in the days of Tertullian and Cyprian, and in Egypt under Clement of Alexandria, Origen and Athanasius. To-day Islam is supreme, though the North Africa Mission, working largely on medical lines, has penetrated into many cities. In Egypt the United Presbyterian societies have met with considerable success among the Copts, and their fine educational work has proved a valuable asset both to themselves and the country. The Church Missionary Society is doing steady work in Cairo and in Upper Egypt. In the Eastern Sudan a promising beginning has been made, but the regions south of Kordofan have hardly been touched. In Nigeria the Hausa tribes are coming to be better known, and to respond to the Christian teaching. In the Sahara and at Suakin there are Roman Catholic missions. There is a Roman mission to the Gallas in Abyssinia. That country has its own crude form of Christianity, and is much the same today as when Peter Hesling in the 17th century endeavoured to propagate a purer faith. A mission undertaken by the Church Missionary Society in 1830 was closed by French Jesuit intrigue in 1838.

South Africa.—The Moravians, represented by George Schmidt, who arrived at Cape Town in July 1737, were the first to undertake mission work in South Africa. Schmidt won the confidence of the Hottentots, but the Dutch authorities stopped his work. In 1796 John T. Vanderkemp, an agent of the London Missionary Society, founded a mission to the Kaffirs east of Cape Town, and Robert Moffat (1818) went to the Bechuana. David Livingstone was as determined to open the interior as the Boers were to keep it shut, and he succeeded, pushing north, discovering Lake Ngami, and consecrating a remarkable life to the evangelization of Central Africa. The London Mission has also largely evangelized the Matabele. In 1814 the Wesleyans began work among the Namaquas and Hottentots, and afterwards went into Kaffraria, Bechuana, and Natal. They were followed by the Glasgow Missionary Society (1821), the Paris Evangelical Society (1829), the Moravians, Rhenish, and Berlin Societies, and the American Board. The Society for the Propagation of the Gospel came in 1819, mainly for colonists, the Church Missionary Society in 1837. The province of South Africa has ten dioceses, the bishop of Cape Town being metropolitan. The Glasgow Society’s work was ultimately taken over by the Free Church of Scotland, whose great achievement is the Lovedale Institute, combining industrial and mission work. The Germans and Scandinavians have also been ardent workers in South Africa, and the Dutch Reformed Church has not entirely neglected the natives. One Dutch society gives its attention to the northern part of the Transvaal. The chief difficulties in the way of evangelization have been (1) the hostility of natives races aroused by European annexations, (2) the introduction of European vices, (3) the movement known as Africanism. The British Wesleyans refused to confer full rights on negro pastors, who then appealed to the African Methodist Episcopal Church, a product of American evangelization. One of them, J. M. Dwayne, was made Vicar-Bishop, and a large and powerful independent negro church organized. Dwayne afterwards approached the Anglicans, and in 1900 that church formed the “Ethiopian Order,” ordaining Dwayne a deacon and making him Provincial of the Order. Each bishop now deals with the Ethiopians in his own diocese. The South African governments foresaw dangerous developments in the Ethiopian movement, and steps were taken to restrain its growth. Ethiopianism, if ecclesiastical in its origin, gained strength from racial base. The task of averting the racial bitterness so dominant in the United States of America is a most formidable one. There are in South Africa several vicariates and prefectures of the Roman Church, the principal missions being French, those of the Congregation of the Holy Ghost and the Oblates of Mary.

West Africa was first visited by the Society for the Propagation of the Gospel in 1752. Its agent, T. Thompson, trained Philip Quaque, said to be the first convert who ever received ordination since the Reformation in the Reformed Church.” The Church Missionary Society came in 1804 and has worked heroically and successfully, though the largest mission now is that of the Wesleyans, who came in 1811, settling first at Sierra Leone. The American Baptists in Liberia (1821) and the Basel Mission in the Gold Coast (1827), the Congregationalists of the United States of America and Canada in Angola, and the English and American Baptists on the Congo (since 1875) have also extensive and prospering agencies. West Africa has taken heavy toll not only in money but in life, but the lesson has now been learned, and a system of frequent furloughs combined with a better understanding of the climatic requirements have appreciably lessened the peril. This region is linked with the name of the Anglican negro Bishop, Samuel Crowther, and with one phase of the ceaseless strength of Islam, which has so far failed to reach the west coast, finding itself confronted by the Christian influences which are at work among the great Hausa tribes and other peoples within the area of the Niger mission. The Portuguese in Angola and the agents of King Leopold in the Congo State have not been conspicuous friends of missionary enterprise, and the light-hearted childishness of the native character, so well portrayed in Miss Kingsley’s writings, shows how difficult it is to build up a strong and stable Christian church. Bishop Taylor’s effort at creating a self-supporting mission proved fruitless. The American Lutherans are attempting the same task on rather different lines, and with more promise. The Roman Catholic missions are chiefly French, and organized by the Congregation of the Holy Ghost and the Lyon African Mission.

Central Africa.—The upper Congo region opened up by Livingstone and Stanley has been a favourite sphere for what are known as “faith societies,” e.g. the Plymouth Brethren, the Christian and Missionary Alliance, the Regions Beyond Missionary Union. The American Baptists continue the work started by the Livingstone Inland Mission in 1878, and the Southern Presbyterian Board (American) have done notable work. The Paris Society, represented especially by François Coillard, has been successful along the Zambezi, and Scottish, German, Moravian and Jesuit agencies are also well represented. Northward, Central and East African organizations, following the Cape to Cairo route, are in touch with North African agencies working up the Nile.

East Africa.—When the Abyssinia mission was closed in 1838 one of the missionaries, Krapf, went among the Gallas and Mandaeans. Since H. M. Stanley’s appeal (1873) most extensive and intensive work, and a large number of missionaries, has been accomplished in Uganda, by the Church Missionary Society. The names of Mackay, Hannington and Pilkington, who lived and died here, are amongst the greatest in the roll of missionary heroes. The Roman Mission too has been very successful; for some years a French agency, the White Fathers of Algeria, carried it on, but they were afterwards joined by English helpers from St. Joseph’s Society at Mill Hill. The White Fathers also work in the Great Lakes region, and on the Zanzibar coast are the French Congregation of the Holy Ghost and German Benedictines. Zanzibar is also one of the centres of the Universities Mission, another being Likoma on Lake Nyasa. Near this lake the Scottish churches are also doing noble work. Besides Uganda the Church Missionary Society is responsible for Mombasa. The London Mission is meeting with success at the south end of Lake Tanganyika in North-east Rhodesia. The English United Methodists and some Swedish societies have begun work among the Gallas. German Missionary agencies have also come in with German colonization. In East Africa, as in the West, Christian missionaries fear most the aggressive Moslem propaganda.
MISSIONS

Madagascar\(^1\) is one of the most interesting mission fields. Work was begun by the London Mission in 1819, and the work of civilization and evangelization went steadily forward till 1835, when a period of repression and severe persecution set in, which lasted till 1861. When the work was recommenced it was found that the native Christians had multiplied and developed during the harsh treatment of the 25 years. In 1860 the idors were publicly destroyed and the island declared Christian by royal proclamation. The Society for the Propagation of the Gospel (1864), the Norwegian Missionary Society (1866), and the Friends' Foreign Missionary Association joined in the work, the prosperity of which received a severe check by the French annexation in 1896. The French authorities were hostile to the English missionaries, and even the handing over of part of the field to the Paris Evangelical Society did not do much to ease the situation. Laws were first enacted against private schools, then against elementary schools, and in 1906-1907 measures were passed which practically closed all mission schools. Family prayers were forbidden if any outside the immediate family were present, and religious services at the graveside were prohibited. Missionary work in the island has thus passed through a peculiarly trying experience, but happier conditions are now likely to prevail. In Mauritius and the Seychelles the Church Missionary Society and the Society for the Propagation of the Gospel are at work, especially among the coolies on the sugar plantations.

The outstanding problem of African missions at least north of the Equator (south there is the Ethiopian question) is not the degradation of the native, but the demonization and the elimination of heathen Christians, nor even the slave dealer, though all these obstacles are present and powerful. The all-decisive conflict is that between Christianity and Islam, and the Christian agencies must show much more zeal and activity in this direction than heretofore. The liberal Western missionary work has been, generally speaking, simple gospel preaching followed by education and industrial work. So rare were the ordinary catechumens, and even necessities of life, that the latter had to take a prominent part in the work. But the heathen had to be amazed to see these men who were cobblers, carpenters, brickmakers, tailors, printer, house and church builder, not only for himself but for his converts. The work of Bible translation has been particularly long and difficult; for the innumerable peoples who did not speak some form of Arabic the languages had first to be reduced to writing, and many Christian terms had to be coined.

India.\(^2\)—The earliest missionaries to India, with the possible exception of Pantaenus of Alexandria (c. A.D. 150), were the Nestorians from Persia. The record of their work is told elsewhere (see NESTORIUS and NESTORIANS). The Jesuits came in the 16th century, but were more successful quantitatively than qualitatively; in the 18th century the Danish coast mission on the coast of Tranquebar made the first Protestant advance, Bartholomäus, Ziegenbalg (1685-1710), Pluchot and Christian Friedrich Schwartz (1726-1768) being its great names. Up to this time the chief results were that (1) Christianity had gained a footing, (2) it had continued the monothetic modification of Indian thought begun by Mahomedanism, and (3) the tuttity of sporadic and fanaticol proselytism had been shown. A new era began with the arrival of William Carey and the founding of the Serampur Mission (15 m. north of Calcutta), though the hostility of the East India Company made the early years of the 19th century very unproductive. When Carey died in 1834 he and his colleagues Marshman and Ward had translated the Bible into seven languages, and the New Testament into 23 more, besides rendering services of the highest kind to literature, science and general progress. They founded agricultural societies and savings' banks, and helped to abolish suttee, infanticide and other cruelties. At Travancore in the south, Ringle- tauda, an agent of the London Missionary Society, had begun a work, especially among the Shanars or toddy drawers, which by 1850 had 13,000 converts; and the Church Missionary Society, led by Rhenius, had equal success in Tinnevelly. The Baptists, drawn by the fame of the temple of Jagannath at Puri on the east coast, established a mission in Orissa in 1831 which soon bore fruit; the Wesleyans were in Ceylon, Mysore and the Kaveri valley, the London Missionary Society at the great military centres Madras, Bangalore and Bellary, agents of the American Board at Ahmednagar and other parts of the Mahattra country around Bombay. The headquarters of Hinduism, the Ganges valley, was occupied by the Baptists, the Church Missionary Society and the London Missionary Society, these entering Benares in 1816, 1818 and 1820 respectively. Alexander Duff, a Scottish Presbyterian, had begun his great educational work in Calcutta, and Bible tract and book societies were springing up everywhere. Chaplains and bishops of the Anglican Church like James Hough in Tinnevelly, Henry Martyn in the north, Daniel Corrie in Agra, T. F. Middleton in Calcutta, and Reginald Heber all over India, were eagerly using their opportunities. In 1830 ten societies with 106 stations and 147 agents were at work; 1843 saw the founding of the Basel Mission on the west coast, the American Mission in Madura, the American Presbyterian Mission in Jaugarnya, and the Dr Valentine of the United Presbyterians. (3) Orphanages, in which the Roman Catholics led the way and have maintained their lead. (4) Vernacular schools, a good example of which is seen in the American Board’s Madura Mission. (5) English education, in which the missionary societies have amply supplemented the efforts of the government, outstanding examples being the Madras Christian College (Free Church of Scotland), so long connected with the name of Dr William Miller, the General Assembly of Scotland’s Institution at Calcutta, founded by Duff, Wilson College, Bombay (Free Church of Scotland), and St Joseph’s College (Roman Catholic) at Trichinopoly. Work of this kind is followed up in some centres by lectures and conversations with educated Hindus. The Haskell Lectureship, which grew out of the Parliament of Religions in Chicago, belongs here. (6) Female education and zenana work. (7) Uplifting work among the Panchams or low castes, which has been strikingly successful among the Malas (American Baptists) and the Madigas (London Missionary Society) of the Teluguspeaking country, who come in mass movements to the Christian faith. (8) Missions among aboriginal tribes, e.g. the Kols and Santals of Chota Nagpur (Berlin Gossner Mission and the Society for the Propagation of the Gospel), and the tribes of the Khasias Mountains east of Bengal (Welsh Calvinistic Methodists) (9) Christian literature, in which connexion the name of Dr John Murdoch will always be honourably remembered. (10) Pastoral work and the care of the churches.

The great changes that have been wrought in India, politically, commercially, intellectually and religiously, by the combined action of the British government and the Christian missions, are evidenced among other tokens by the growth of such societies as the Arya Samaj and the Brahmo Samaj. Orthodox Hindus, especially those whose social status and very livelihood are imperilled by the revolution, have shown their alarm either by open opposition, subjecting converts to every sort of caste coercion, or by methods of defense, e.g. Hindu tract societies and young men’s associations, which are modelled on

MISSIONS

MISSION FIELDS

Christian organizations. A counter reformation can also be traced which attempts to revive Hinduism by purging it of its grossness and allegorizing its fables and legends. A new Islam is also a factor of the situation. Comparatively few converts have been made from Mahomedanism to Christianity, and these have been chiefly among the learned. But there is a wide prevalence of free-thinking, especially among the younger and educated classes of the community.

The special difficulties of mission work in India may be thus summarized. (1) Racial antipathy. (2) The speculative rather than experimental and practical nature of the Hindu consciousness—history, ethics, metaphysics are not equally appealed to him. (3) The lack of a missionary in a land where the joint family system is everywhere and all powerful, individualism and will-power are at a discount. (4) The ignorance and conservatism of the women. (5) An inadequate sense of sin. (6) The introduction of European forms of government anti-Christian philosophy. Perhaps, too, the methods adopted by missionaries have not always been the wisest, and they have sometimes failed to remember the method of their Master, who came 'not to be served, but to serve.' In spite, however, of all the difficulties, permanent and increasing results have been achieved along all the lines indicated above. The establishment of a strong native church is far from being the only fruit of the enterprise, but it is a fruit that can be gauged by statistics, and these are sufficiently striking. In a necessarily inadequate sketch it is impossible to give more than the barest mention to one or two other features of modern missionary achievement in India, e.g. the development of industrial schools, the establishment of a higher and technical education, the spread of Protestantism, the development of Indian congregationalists, the London Missionary Society and American Board and the Presbyterians have joined forces, and the endeavour to train an efficient and educated native ministry, which is being prepared for special work throughout the country. The increase in the number of native preachers and of the number of converts advanced by native Christians, a Christian population of 3,922,241 (native Christians 2,664,313) out of a total population of 224,361,056, or about 3%. The inclusion of the non-converts in these statistics would add about 350,000 to the Christian total. Though the proportion does not seem relatively high, it is significant when compared with that of foreign Christians—1871, 1,517,997; in 1881, 1,862,255 (increase 22.7%); in 1891, 2,284,337 (increase 22.6%); in 1901, 2,905,441 (increase of 28%). The increase of 28% between 1891 and 1901 has often been compared with the fact that the total population of India only registered an increase of 23% in that decade. In the words of The Pioneer, "this is a hard fact which cannot be explained away" and "the most remarkable feature of the returns." The increase was shared by every province and state in India. In 1910 there were 4014 missionaries (including wives), representing 122 societies, 1272 Indian missionaries and 34,095 other native workers, including teachers and Bible-women.

The growth of the Protestant Native Christian community between 1851 and 1910 is shown in the following table:

The Protestant community in India in 1910 was over a million strong, well distributed among the chief provinces, a fine spiritual force, easily first in female education, and rapidly growing in wealth, position and influence. A recent report of the Director of Public Instruction of the United Provinces 1 has called attention to the educational progress of the native Christian community. There can be no question, if the community pursues with steadfastness the present policy of its teachers, that in the course of a couple of centuries it will have secured a preponderating position in all the great professions.

What India wants (as Nobili 300 years ago saw, and attempted, though by fatal methods of deceit, to supply) is a Christianity not foreign. In the end Christianity is a religion and nothing else, and its fulfilment. Though there are many Christians in India to-day, the Hindu still looks askance at Christianity, not because it is a religion but because it is foreign. "India is waiting for her own divinely appointed apostle, who, whether Brahmin or non-Brahmin, shall connect Christianity with India's religious past, and present it as the true Vedanta or completion of the Veda and thus make it capable of appealing to the Hindu religious nature."

It only remains to be said that the work of the missionaries individually and collectively has over and over again received the warmest recognition and praise from the highest officials of the Indian government.

China. — The earliest Christian missionaries to China, as to India, were the Nestorians (q.v.). Their work and that of the Roman Church, begun as the result of Marco Polo's travels about 1290, faded away under the persecution of the Ming dynasty which came to power about 1350. The next attempt was that of the French Jesuits, following on the visit and death of Xavier. They established themselves at Canton in 1582, and on the accession of the Manchu dynasty (1644) advanced rapidly. In 1685 there were three dioceses, Peking, Nanking and Macao, with a hundred churches. The Orthodox Eastern Church gained footing in Peking in the same year, and established a college of Greek priests. Friction between Jesuits and Dominicans led to the proscription of Christianity by the emperor in 1724, missionaries and converts being banished. The story of modern missions in China begins with Robert Morrison (q.v.) of the London Missionary Society, who reached Canton in 1807, and not being allowed to reside in China entered the service of the East India Company. In 1813 he was joined by a colleague, William Milne, and in 1814 baptized his first convert. In 1820 came representatives of the American Board, in 1836 Peter Parker began his medical mission, and on the opening of the Treaty Ports the old edicts were withdrawn, and other societies crowded in to a field more than ample. After the war of 1856 a measure of official toleration was obtained, and the task of evangelizing the country was fairly begun. Though the missionaries were chiefly concentrated in the treaty ports they gradually pushed inland, and here the names of W. C. Burns, a Scottish evangelist, and M. A. Taylor, the founder of the China Inland Mission, and James Gilmour, the apostle of Mongolia, are pre-eminent. But for more than half a century China seemed the most hopeless of mission fields. The upper classes were especially anti-Christian, and the whole nation vaunted its superiority to the rest of mankind. In 1857 there were only about 400 baptized Protestant Christians in the whole of China. Even after the removal of the edicts the old prejudices remained, and the missionaries were regarded as political emissaries, the forerunners of military aggression. Native Christians were stigmatized as traitors, "followers of the foreign devils." In 1870 there was a great outbreak concentrating in the massacres at Hankow and Tientsin; in 1891 at Hunan and in 1895 at Ku Cheng there were other attacks which were only preliminary to the Boxer uprising of 1899—1900, when 135 missionaries, besides 52 children and perhaps 16,000 native Christians, whose heroism will always be memorable, perished, often after horrible tortures. There is little doubt that this savage outburst was directed not against religious teaching as such, but against the introduction of customs and ideas which tended to weaken the old power of the mandarins over the people. These leaders skilfully seized upon every breach of tradition to inflame popular passion, attacking especially the medical work as a pretext for mutilation, the schools as hotbeds of vice, and the orphanages as furnishing material for witchcraft. Out of the agony, however, a new China was born. The prestige of Japan, seen in her wars with China and Russia, and the importance of the Boxers as against the European allies, made all classes in China realize their comparative impotence, and the central government began a series of reforms, reorganizing the military, educational, fiscal and political systems on Western lines. Educational reforms became especially insistent, and modern methods and studies supplant ed

1 See A. H. Smith, Chinese Characteristics; Village Life in China; and J. C. Gibson, Mission Problems and Mission Methods in South China.
This great missionary was well received by the daimios (feudal lords), and though he remained only 2½ years, with the help of a Japanese whom he had converted at Malacca he organized many congregations. In 1581 there were 220 churches and 150,000 Christians; ten years later the converts numbered 600,000, in 1594 a million and a half. Then came a time of repression and persecution under Ieyasu, whose second edict in 1614 condemned every foreigner to death, forbade the entry of foreigners and the return of Japanese who had left the islands, and extinguished Christianity by fire and sword. The reopening of the country came in 1859, largely through American pressure, and in May of that year two agents of the Protestant Episcopal Church began work at Nagasaki. They were followed by others from the Presbyterian and Reformed Churches, and by their great intellectual ability, patience and tact these pioneers (S. R. Brown, J. C. Hepburn and G. F. Verbeck), as the Marquis Ito said, contributed very largely to the progress and development of Japan in the days when she was first studying the outer world. They did an immense amount of preparatory work along evangelistic, medical and educational lines, and skilfully gathered the youths of the country around them. The accession of a new mikado in 1868 finally ended the old seclusion; financiers, engineers, artisans poured in from Western Europe, and from America came bands of teachers, largely under missionary influence. In 1869 the American Board (Congregational) sent its first band; in 1870 Verbeck was called on to organize a scheme for national education. In 1872 the first Japanese church was formed; in 1875 Joseph Neesima, who had been converted by a Russian missionary and then educated in America, founded a Christian Japanese College, the Doshisha, in the sacred city of Kyoto. Meanwhile the Christian calendar had been adopted and the old anti-Christian edicts removed. By 1889 there were 30,000 Protestant communicants. It was at this time that the nation, conscious of its new life, began to be restive under the supercilious attitude of foreign nations, and the feeling of irritation was shared by the native Christian communities. It showed itself in a desire to throw off the governance of the missionaries, in a criticism of Protestant creeds as not adapted to Japanese needs, and in a slackened growth numerically and intensively. After a period of stress and uncertainty, due very largely to the variety of denominational creed and polity, matters assumed an easier condition, the missionaries recognizing the national characteristics and aiming at guidance rather than control. The war with China in 1894 marked a new chapter and initiated a time of intense national activity; education and work for women went forward rapidly. Missionaries went through the island as-never before, and their evangelical work was built upon by Japanese ministers. In the war with Russia Japanese Christianity found a new opportunity; on the battlefield, in the camp, at home, Christian men were pre-eminent. In 1902 there were 50,000 church members; in 1910, 67,045; the total Protestant community in 1910 was about 100,000, and had an influence out of all proportion to its numbers; the Roman Church was estimated at 79,000, and the Orthodox Eastern Church at 25,000.

No sketch, however brief, can omit a reference to the Anglican bishop of South Tōkyō, Edward Bickersteth (1850–1897), who from his appointment in 1886 guided the joint movement of English and American Episcopalians which issued in the Nippon Sei Kokwa or Holy Catholic Church of Japan, a national church with its own laws and its own missions in Formosa. In April 1907 the Conference of the World's Student Christian Federation (700 students from 25 different countries) met in Tōkyō, and received a notable welcome from the national leaders in administration, education and religion.

In Korea, the "Hermit Nation," or as the Koreans prefer to say, "The Land of the Morning Calm," Christianity was introduced at the end of the 18th century by some members of the Korean legation at Pekin who had met Roman Catholic missionaries. It took root and spread in spite of opposition until 1864, when an anti-foreign outbreak exterminated it. The door was re-opened by the treaties of 1858–1866, and even before that
MISSIONS

copies of the gospels had been circulated from the Manchuria side. The Methodist Episcopal Church and the Presbyterian Board, both of America, entered the country in 1888, and were soon joined by similar agencies from Canada and Australia. The Anglican Church began work in 1890, the work was thoroughly planned, the characteristics of the people were carefully considered, and the successes and failures of other mission- fields were studied as a guide to method. The medical work won the favour of the government, and so wisely did the missionaries act, that during all the turbulent changes since 1884 they escaped entanglement in the political disturbances and yet held the confidence of the people. The persistence and growth of Christianity among the Koreans is largely due to the fact that Christianity had not been superimposed on them as a foreign organization. They had built their own churches and schools, adopted their own forms of worship and phrased their own beliefs. Korea vies with Uganda as a triumph of modern missionary enterprise. In 1886 there were not more than 100 Christians; official returns in 1910 show 178,656 Protestants, including 72,000 church members and probationers; and 72,200 Roman Catholics. Theological colleges, normal training colleges and higher and lower grade schools bear witness to an activity and a number of workers not exceeded by any country. India

South-East Asia and the East Indies.—The work of Christian missions in this area has had the double advantage of freedom from political and social unrest, and of comparatively little overlapping, each country as a rule being taken over by a single society. In Burma the American Baptists, whose work began with Adoniram Judson in 1813, are conspicuous, and have had marked success among the Karens or peasant class, where the pioneer was George Dana Boardman (1827). The Karen Christian communities are strong numerically and have a good name for self-support. The Baptists have also stations in Arakan and Assam where they link up with the Welsh Calvinistic Methodists (1843). The society for the Propagation of the Gospel and the Methodist Episcopal Church work in and around Rangoon. In Siam again the Americans, especially the Presbyterians, have been most prominent. Medical work made an impression on the people and won the favour of the government, which has always been cordial and has employed missionaries as court-tutors. Buddhism is at its best at Siam, and this and the predominating Sino-Burmese element have made the country a naturally small direct success of Christian propaganda in Siam proper. In the Laos country to the north, however, much more has been done, and a healthy type of Christian community established. Native workers have done work to carry the Gospel into the French colonies of Tonking and Annam. Here the Roman missions are very extensive, and have over a million adherents, despite violent persecution before the French occupation.

The peninsula and archipelago known as Malaaysia presents a remarkable mingling of races, languages and beliefs. Tatar, Mahomedan and Hindu invasions all preceded the Portuguese who brought Roman Catholicism, and the Dutch who brought Protestantism. This last resulted in a great number of nominal conversions, as baptism was the passport to government favour, and church membership was based on the learning of the Decalogue and the Lord's Prayer, and on the saying of grace at mealtimes. In the Straits Settlements the foundations of modern missionary effort were laid by the London Missionary Society pioneers who were waiting to get into China; they were succeeded by the Society for the Propagation of the Gospel (1858), English Presbyterian (1857), Methodists Episcopalians (1858), who have a fine Anglo-Chinese College at Singapore, and the Church of England Zenana Society (1900).

In the Archipelago most of the work has naturally been in the hands of the Netherlands Missionary Society (1812) and other Dutch agencies, who at first were not encouraged by the colonial government, but have since done well, especially in the Minahassa district of Celebes (150,000 members) and among the Bataks of Sumatra (Rhenish Mission). In Celebes and the Moluccas the work is now under the Colonial State Church. In Java the government has favoured Mahomedans (there is active intercourse between the island and Mecca), but there are some 25,000 Christians and a training school and seminary at De polea, near Batavia, for the Indian Christians. The American Presbyterian Church is slowly making headway among the Dyaks; in British Borneo the society for the Propagation of the Gospel (1848) and the Methodists Episcopalian occupy the field. The total number of Christians in British Malaya and the Dutch East Indies is about 600,000 (including 57,000 Roman Catholics).

Western Asia and the Turkish Empire.—The American Presbyterians and Congregationalists have the largest Protestant missions in these lands, working, however, mainly for the enlightenment and education of the Oriental Christians. With the same object, though on different lines, the archbishop of Canterbury's Assyrian Mission seeks to influence the Nestorians. The Roman Catholics have extensive missions in these countries, directed at winning adherents to the unity of the Holy See from the Oriental Churches, which are regarded as schismatic and heretical. In this enterprise there has been great advance in Egypt among the Copts. and in 1899 the Pope signaled the "resurrection of the Church of Alexandria" by appointing a Patriarch for Egypt, Libya and Nubia. Farther east, on the borders of Turkey and Persia, the Roman and Russo- .Greek missionaries have done much good among the Armenians, Chaldeans and Armenians. The Franciscans, Dominicans, and Jesuits and Jesuits are engaged in all these works. Direct work among Mahomedans is done, though with small result, by the North Africa Mission (non-denominational) and the Church Missionary Society. The Egypt, Palestine and Persia missions of the latter society have been largely reinforced and extended since 1884, medical work and women's work being especially prominent. Four cities in southern Persia are now occupied. Three missions just touch the border of Arabia, viz. the United Free Church of Scotland at Aden, founded by ion Keith-Falconer (1856-1887) son of the 9th earl of Kintore and Arabic professor at Cambridge; an American Presbyterian Mission on the Persian Gulf; and the Church Missionary Society's Mission at Bagdad. The American Robert College at Constantinople and the work of the Friends' Missionary Association in Syria are honourable and successful enterprises. The chief difficulties have been (1) the antagonism of the officials of the Oriental churches, (2) the suspicion and hostility of Islam, (3) the jealousies, religious and political, characterizing the work of the various denominations. The Jesuits and Jesuits have done much work among the Christians of the region, and in parts of the Levant but their effect has been limited. Missions in Christian lands.—Australia has been referred to already (see South Seas, above). In the Western Hemisphere we may distinguish the following: (1) Early Roman Missions began with the discovery of the continent and practically ceased in the middle of the last century. Among the earlier was the conversion of Mexico, 200,000 converts being enrolled within six years after the capture of the capital (1521), and a million baptized by the Franciscans alone within thirty years. In South America the Jesuits were given a large mission over 700,000 square miles embracing the Andes and the Patagonian territory. The Jesuits thus acquired a mission in Brazil and in the adjoining Provinces they were used to retain control of the country, and in later times were used to control the missionary work of other denominations. They had the advantage of an established government and the Roman faith. Their natural devotion and their susceptibility to pomp and ritual was a factor skillfully used by the priests, but hardly anything was done to strengthen their moral power. The influx of European settlers helped to reduce the whole continent south of Mexico in about a century to a level as low as that preceding the first mission. About 1600 the Franciscans and French Jesuits began their work in North America, and among the most useful was the work of Father de la Croix, a native of New France, and a prominent figure in the mission work of the early French and Indian tribes. He also acquired the Roman Church to keep its hold on the Red. The French and French colonies of Quebec and Montreal, and were missionaries among the Indian tribes of North America and among the Red Indians of Canada. (2) Modern Missions in North America.—Missions among the Red Indian tribes in the North-West Territories and other United States and Canada have long been carried on by several societies. The first workers were Thomas Mayhew, junior and John Eliot at Martha's Vineyard (1643) and Roxbury (1648). Bishop Whipple of Minnesota was justly called the Apostle of the Indians, so far as the work of the American Mission was concerned. In the Canadian North-West the Church Missionary Society's Missions have reached many tribes up to the shores of the Arctic, and made some thousands of converts. Even the western most American is now within the range of the Indian mission. The Anglican Church has nine dioceses in the province of Rupert's Land. The Roman Catholic missionaries have converted many tribes of these immense territories, and have a large number of Indian establishments in Canada. The Russo-Greek Church has a mission in Alaska, dating

from the time when it was Russian territory, and various American societies are also represented. The total number of Indians in British North America is 99,000, of whom about 27,000 are still pagan, and the rest are about equally divided between the Protestant and Roman Catholic Missions. (g) Central and South America—Protestant missions to Indians have been very limited. Von Weltz did something in Dutch Guiana (c. 1570), and the Moravians among the Ararawak Indians of Surinam (1738-1806). Since 1847 they have worked on the Mosquito coast of Central America. American missions are at work in Mexico and adjacent countries. In the West

India Islands the negro population has been reached by most of the larger British societies. The South American Missionary Society, founded by the ill-fated Captain von der Lüttke, has much extended its work among the Indians of the interior of what has been well called "the Neglected Continent"; it has been specially successful among the Araraquaras of Brazil and the Paraguayans. Their work among the Fuegians drew a warm tribute from Charles Darwin. Several American missions are also at work. The Society for the Propagation of the Gospel has an important mission in British Guiana. But there are numerous heathen tribes never yet reached. The Roman Church, which is dominant, has been engaged in serious struggles with the anti-religious tendencies of the Republican government, and L'Annee d'Eglise makes no mention of missions among the Indians. In fact the Pope in 1807 was obliged to send a severe rebuke to the clergy for their lack of consistency and zeal. Protestant societies have done much to bring the Bible to the knowledge of the nominally Roman Catholic population.

RESULTS OF MISSIONS

The Christian Church bas its missionary enterprise upon the spirit, the example, and the commandment of its Founder, and regards the duty as just the same whether the results be

large or small. It appeals to common sense, saying in effect, "If it be a fact that a Divine Person came into the world to bless mankind, all men ought to know it, and have a right to know it. However much or (if you will) a little a Buddhist or 3

Christian and non-Protestant peoples. The figures are for 1907, and should be compared with those in the Statistical Atlas. This list gives a total of 69 Foreign Missionary Societies, of which 54 are American, 14 British, 10 German, and 5 others. The statistics for these 69 societies may be grouped as follows:

II.—SUMMARY OF PROTESTANT MISSIONARY WORK.

| 
| 

Moslem may need to know of Christ, he certainly has a claim to be told of Him. The responsibility if there be any, of believing, rests with the individual told; the responsibility of telling him rests with the Christian Church. On this view of the matter, results, however desirable, are no certain test of a mission doing its work. A mission in Persia, with its handful of converts, has, on this view, as much right to support and appreciation as a mission in southern India with its tens of thousands. Again, on the hypothesis that Christianity is true, the statistics at a particular period are no test of success at all. For in them, the dead are not counted; and the converts who are already dead are—at least in respect of individual salvation—the surest of

results. If, however, we are to take statistical returns for what they are worth, it is estimated that the Christians in heathen lands gathered by Protestant missions probably amount to five millions, and a similar total may be ascribed to Roman Catholic missions, making ten millions in all. This, however, includes adherents still under instruction for baptism, and their children. The inner circle of communicant members is hardly more than one-third of the total.

Missions are however a far greater thing after all than simple proselytism. It would require many a volume to tell of what they have done for civilization, freedom, the exploration of unknown regions, the bringing to light of ancient literatures, the founding of the science of comparative religion, the broadening of the horizon of Christian thought in the homelands, and the bringing of distant peoples into the brotherhood of nations. These are results that cannot be put into figures. While it is true that very diverse opinions are held concerning missions, it is indubitable that the most favourable testimonies come from those who have really taken the most pains to examine and understand their work. The one discouraging feature, from the Christian point of view, is the backwardness of Christendom in its great enterprise. If the Churches did their foreign work with the same energy which they throw into their home work, the results would be very different.

The figures given below are taken from a table compiled by Dr D. L. Leonard, and refer only to Protestant missions to non-
Mississippi, a South Central state of the United States, situated between 33° 39' lat. and 31° 37' lat., with its S.E. part extending to the Gulf of Mexico, the extreme southern point being in 30° 33' lat. near the mouth of the Pearl River. On the map the Mississippi enters the state from the S.W. at 88° 7' W. long. in the N.E. corner of the state; the boundary has its extreme W. point at 90° 41' W. long. in the S.W. corner of the state. Mississippi is bounded N. by Tennessee, E. by Alabama, S. by the Gulf of Mexico and Louisiana, W. by Louisiana, from which it is separated by the Pearl River and by the Mississippi, and by Arkansas, from which also it is separated by the Mississippi. The total area is 46,865 sq. m., of which 503 sq. m. are water surface.

Physical Features.—Mississippi lies for the most part in the Mississippi embayment of the Gulf Coastal Plain. A feature of its surface is a strip of bottomland between the Mississippi and Yazoo rivers, called the Delta, and at its mouth; it reaches to 175 m., and has an average width of more than 60 m., and covers an area of about 7000 sq. m. With the exception of a few flat ridges running from north to south, it is so low that it requires, to protect it from overflow, a riverbank embankment of 15 ft. in height; these were built and are maintained by the state in part from a special tax on the land and in part from the sale of swamp lands of the United States (under an act of 1896). Along the eastern border of this delta, and southward of it, the Mississippi itself, extends a belt of hills or bluffs (sometimes called "cane-hills"), which is cut by deep ravines and, though very narrow in the north, has in the south an average width of about 10 m. East of the belt are low or gently undulating uplands, characterized by the red clay and the shrubs and grasses they support. The highest elevations, from 800 to 1000 ft. above the sea, are on the Pontotoc ridge in Tippah and Union counties; and from this ridge there is an almost imperceptible slope south and west from the Appalachian Mountain system. Along the margin of the bottomland, though not far from the water courses the differences of elevation are much less. The coast-line, about 85 m. long, is bordered by a beach of white sand, and broken by several small and shallow indentations, among which are St. Louis, Biloxi, Passaquina and Point aux Chenes bays; separated from it by the shallow and practically unnavigable Mississippi Sound is a chain of low, long and narrow sand islands, the largest of which are Petit Bois, Horn, Ship and Cat. The principal rivers are the Mississippi on the western border, and its tributaries, the Yazoo and the Big Black; the Pearl and Passaquina, which drain much of the southern portion of the state and flow into the Mississippi; Big Black, which drains much of the western portion of the extreme north-east are the principal rivers; the Tombigbee, extending from the eastern part of the state southward, this ridge divides in Choctaw county, the eastern branch separating the drainage basin in the Pearl from that of the Big Black and the Mississippi. The Delta is drained chiefly by the Yazoo. A small area in the north-eastern corner of the state is drained northward by the Blackwater and the Tombigbee, which are fed by smaller streams; their fall is usually gentle and quite uniform. The valleys vary in width from a few hundred yards to several miles. In the east of the state much of the valley of each of these rivers is broad and flat, but as the river leaves the low water mark and forms the "hommock" or "second bottom" lands. Most of the rivers flowing into the Gulf are obstructed by sand-bars and navigable only during high-water from January to April. Oxbow lakes and backswamps are common only in the Delta.

Mississippi is characterized by two important geological provinces: the Cretaceous province and the Appalachian province. The Cretaceous province includes the eastern and southern parts of the state, while the Appalachian province includes the western and northern parts.

Geology.—The older formations are nearly all overlaid by deposits of the Cretaceous period. Quadrata, a genus of marine Tertiary fossils, is abundant. In the extreme north-east are found the oldest rocks in the state—lower Devonian (the New Scotland beds of New York) and, not so old, an extension of the Lower Carboniferous which underlies the Warrior coal beds and contains the Buckhorn sandstone. The basaltic flows of the Big Black and the Tombigbee are of the Lower Carboniferous. The Battle Mountain sandstone, of the upper Carboniferous, is the most common rock in the state, and is generally of a grayish or greenish color. The Blackwater sandstone and the Wolf River sandstone are also common. The Cretaceous rocks are characterized by their fossiliferous nature. The oldest rocks in the state are the lower Devonian, which are found in the extreme north-east. The youngest rocks in the state are the recent Tertiary rocks, which include the Tertiary Conglomerate, the Tertiary Sandstone, and the Tertiary Limestone. The Tertiary Conglomerate is a coarse-grained rock, consisting of pebbles and boulders of igneous and metamorphic rocks. The Tertiary Sandstone is a fine-grained rock, consisting of quartz sand and clay. The Tertiary Limestone is a rock composed of calcite and other minerals.
MISSISSIPPI

(or Tallahatta Buhristone) formation lies south-westward from the last-named in a strip 10-30 m. wide, whose south-eastern extremity is the intersection of the 32nd meridian with the Alabama boundary, is characterized by beds of aluminous grey and white sandstones, with a little chert, and of cherty sandstones, and interbedded with green sand and marls. The calcareous Calbra or Calbriana-Lisbon formation-group lies south of the last, in a wedge-like strip with the apex on the Alabama boundary; it is a series of clays and sands and siltstones, and the few fossil-bearing beds in the Lisbon beds, is made up chiefly of grey calcareous clay marls, bluish calcareous, green sand and grey silicious sandstones. *Basil-
sareras* (or *Zeuglodon*) bones are found only in the Jackson marls, and in the clays and sands and siltstones of the Mississippi River, in the formation is 240 ft. The Vicksburg formation lies next in order south-west, in a narrow strip of fairly regular width which alone of the Tertiary formations runs as far west as the Mississippi River; it is made up of clays and sands and siltstones, and is about 60 ft. in thickness, and the formation by semi-crystalline limestones and blue and white sand marls. Marine fossils are very abundant in the marl. The Grand Gulf group, of formations of different ages, consisting of sands, sandstones and clays, and showing a few fossil plants, but no marine fossils, extends southward from the last to within a few miles of the coast, and is 750-800 ft. deep.

The older formation of the Quaternary period is the Lafayette (also called "Orange-sand" or "stratified drift"), which immediately overlies all the Cretaceous groups except the prairies of the Selma chalk, and all the Tertiary except the Porters Creek and Vicksburg formations and parts of the Jackson. Its depth varies from 30 to 100 ft. in the coastal plain, and 200 ft. inland, and it forms the body of most of the hills in the state. Its materials are pebbles, clays and sands of various colors from white to deep red, tinged with ochres of iron, which sometimes cements the pebbles into a red gravel or sandstone. The finer sands are of aluminous sandstones are very fantastic—tubes, hollow spheres, plates, &c., being common. The name stratified drift has been used to indicate its connection with the northern drift. The fossils are few, and some are extensive, as in the Jackson, and varicolored in the Lafayette. In Well-preserved pebbles of amorphous quartz (agate, chalcedony, jasper, &c.) are found in the stratified drift along the eastern side of the Tertiary region of the state, and from Columbia, northward. The seventh formation is the esker sands, which are the sands and drifts of 20 m. of the Gulf coast, and, with alluvium, in the Yazoo Delta. Heavy clays, gravel and sands, containing cypress stumps, driftwood and masticod bones, are characteristic. The loess or bluff forming this esker has been used by the whites to form large bluffs running continuously through the state. Its fine-grained, unstratified silt contains the remains of many terrestrial animals, including fifteen mammals.

Flora.—Among the more common species of game are squirrels, opossums, musk-rats, rabbits, racoons, wild turkeys, "partridges" (quail, or Bob White), geese, and ducks; deer, black bears, grey (or timber) wolves, black wolves and "wild cats" (lynx), once common, harriers and hawks, pelicans in the fall, sandhill cranes, and there are some rattle-snakes on the uplands. Among the great variety of song-birds the mocking-bird is prominent; the parakeet is found in the southern part of the state. Buffalo-fish, paddle-fish, catfish, and white perch are common. Some of the finest springs, siltwood and masticod bones, are characteristic. The loess or bluff forming this esker has been used by the whites to form large bluffs running continuously through the state. Its fine-grained, unstratified silt contains the remains of many terrestrial animals, including fifteen mammals.

Flora.—Originally Mississippi was almost entirely covered with a growth of forest trees of large size, mostly deciduous; and in 1900 about seven-tenths of its area was still classed as timbered. The north central part of the state, known as the "flat woods," is level and heavily forested. There are more than 120 species of trees in the state, 15 of oak alone. The most valuable species for lumber are the white oak, yellow poplar, black walnut, and southern third of the state, sometimes called the "cow-country"; the short-leaf pine, found farther north; the white oak, quite widely distributed; cottonwood and red gum, found chiefly on the rich alluvial land. Orchards are common in the Delta (Bolivar, Claiborne, Madison, Yazoo and Leflore counties), the largest cotton-producing region of the world, and in Monroe, Lonidews and Noxubee counties on the Alabama border. The acreage of Indian corn in 1907 was 818,957, of which 519,739 was used for feed and 299,218 acres of other cermals decreased during the latter half of the 19th century: oats, from 1,939,620 bushels in 1879 to 1,611,000 bushels in 1897; wheat, from 557,925 bushels in 1859 to 22,000 in 1897; rye, from 290,925 bushels in 1859 to 18,000 in 1897; and barley, from 18,745 bushels in 1859 to 2,000 bushels in 1897. The amount of tobacco during the last ten years has been 1,200,000,000 pounds. The acreage of sugar-cane has decreased from 4,872,734 to 3,156,000,000; sugar increased from 1,56,450 to 260,000, and mules from 54,547 to 279,000.

Sugar-cane is grown principally in the southern part of the state, but the cane is grown to some extent in nearly every county. Sweet potatoes, white potatoes and onions also are important crops. The greatest relative advance between 1889 and 1899 in any branch of agriculture was made in the growth of market-garden vegetables and the peaches. Cotton has been universally grown, but has almost been found valuable for the purpose. The number of orchard trees increased nearly 100% within the same decade. At Crystal Springs tomatoes were first successfully grown for the market in 1859. The growing of sugar-cane and grape-vines are widely distributed throughout the state, but with the exception of peaches their yield is greater in the northern portion.

Agriculture.—Mississippi is devoted largely to the cultivation of cotton. Of the total land area of the state, 18,240,736 acres (61.3%) were, in 1900, included in farms, and the improved farm land increased 143.4% since 1890. On the 4,209,146 farms, 3,930,723 acres (97.4%) of all farm land) in 1900. After the abolition of slavery, farms greatly decreased in size and increased in number; the number grew from 69,023 in 1870 to 220,803 in 1900; the average size fell from 597.9 acres in 1870 to 286.8 acres in 1900; 9,314 were worked by owners or part owners (60,585 by whites and 20,827 by negroes); 70,609 were worked by cash tenants (13,950 by whites and 57,194 by negroes); and 67,153 were worked by share tenants (26,861 by whites and 39,691 by negroes).

The acreage of cotton increased from 2,106,215 acres in 1792 to 3,220,000 in 1879; the yield increased from 936,711 bales in 1879 to 4,188,177 bales in 1897. Cotton is grown in every county of the state, but the largest quantity is produced in the Delta (Bolivar, Claiborne, Madison, Yazoo and Leflore counties), the largest cotton-producing region of the world, and in Monroe, Lowndes and Noxubee counties on the Alabama border. The acreage of Indian corn in 1870 was 837,690, of which 362,019 was used for feed and 475,671 acres of other cereals decreased during the latter half of the 19th century: oats, from 1,939,620 bushels in 1879 to 1,611,000 bushels in 1897; wheat, from 557,925 bushels in 1859 to 22,000 in 1897; rye, from 290,925 bushels in 1859 to 18,000 in 1897; and barley, from 18,745 bushels in 1859 to 2,000 bushels in 1897. The amount of tobacco during the last ten years has been 1,200,000,000 pounds. The acreage of sugar-cane has decreased from 4,872,734 to 3,156,000,000; sugar increased from 1,56,450 to 260,000, and mules from 54,547 to 279,000.

Sugar-cane is grown principally in the southern part of the state, but the cane is grown to some extent in nearly every county. Sweet potatoes, white potatoes and onions also are important crops. The greatest relative advance between 1889 and 1899 in any branch of agriculture was made in the growth of market-garden vegetables and the peaches. Cotton has been universally grown, but has almost been found valuable for the purpose. The number of orchard trees increased nearly 100% within the same decade. At Crystal Springs tomatoes were first successfully grown for the market in 1859. The growing of sugar-cane and grape-vines are widely distributed throughout the state, but with the exception of peaches their yield is greater in the northern portion.

Lumber.—Mississippi ranks high among the southern states in the production of lumber. The average annual production of lumber (all kinds) at $32,000 m. From the extreme south most of the merchantable timber had been cut, but immediately north of this there were still vast quantities of valuable long-leaf pine; in the marshes of the coast and in the swamps to the north of the coast, in 1899, the gum was being used as a substitute for it; and on the rich upland soil were oak and gum, red cotton, hickory and maple. The lumber and timber product increased in value from $1,331,886 in 1880 to $1,893,581 in 1905. Pine stumpage and waste are valued, not at Dallastown, the manufacture of charcoal, tar, creosote, tar, &c.

Fisheries.—Fishing is a minor industry, confined for the most part to the Mississippi Sound and neighbouring waters and to the Mississippi and Yazoo rivers. The most valuable branch is the oyster
fishery on the reefs in the Sound, much developed since 1880. The shrimp fishery, too, grew during the same period. About 40% of the total catch of the state is made by the inhabitants of Harrison county on the Gulf of Mexico.

The mineral wealth of the state is limited. Clays and mineral waters are, however, widely distributed. Large quantities of mineral water, sulphur, chalybeate and lithia, bottled at Meridian, Raymond and elsewhere, are sold annually. The state contains deposits of iron, copper, lead, phosphate, lignite, ochres, salt, sulphur, tripoli, fuller's earth, limestones and sandstones; and there are small gas flows in the Yazoo Delta.

Manufactures.—The lack of mineral resources, especially of coal and iron, has prevented the development of manufacture until very recent times. The following industries have developed to some extent:

1. Brick and tile, and an increase in the manufacture of brick and tile has resulted from the growth of population and urbanization.

2. Lumber and saw-mill products, and the growth of the lumber industry.

3. Tobacco, with a decrease in the tobacco industry.

4. Cotton, with a decrease in the cotton industry.

5. Sulphur, with a decrease in the sulphur industry.

6. Scholar's lithia, with an increase in the manufacture of scholar's lithia.

7. Natural gas, with an increase in the production of natural gas.

8. Ice, with an increase in the production of ice.

9. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

10. Charcoal, with an increase in the manufacture of charcoal.

11. Sulfite paper, with an increase in the manufacture of sulfite paper.

12. Lumber and paper, with a decrease in the lumber and paper industries.

13. Lithia, with an increase in the manufacture of lithia.

14. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

15. Charcoal, with an increase in the manufacture of charcoal.

16. Sulfite paper, with an increase in the manufacture of sulfite paper.

17. Lithia, with an increase in the manufacture of lithia.

18. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

19. Charcoal, with an increase in the manufacture of charcoal.

20. Sulfite paper, with an increase in the manufacture of sulfite paper.

21. Lithia, with an increase in the manufacture of lithia.

22. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

23. Charcoal, with an increase in the manufacture of charcoal.

24. Sulfite paper, with an increase in the manufacture of sulfite paper.

25. Lithia, with an increase in the manufacture of lithia.

26. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

27. Charcoal, with an increase in the manufacture of charcoal.

28. Sulfite paper, with an increase in the manufacture of sulfite paper.

29. Lithia, with an increase in the manufacture of lithia.

30. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

31. Charcoal, with an increase in the manufacture of charcoal.

32. Sulfite paper, with an increase in the manufacture of sulfite paper.

33. Lithia, with an increase in the manufacture of lithia.

34. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

35. Charcoal, with an increase in the manufacture of charcoal.

36. Sulfite paper, with an increase in the manufacture of sulfite paper.

37. Lithia, with an increase in the manufacture of lithia.

38. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

39. Charcoal, with an increase in the manufacture of charcoal.

40. Sulfite paper, with an increase in the manufacture of sulfite paper.

41. Lithia, with an increase in the manufacture of lithia.

42. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

43. Charcoal, with an increase in the manufacture of charcoal.

44. Sulfite paper, with an increase in the manufacture of sulfite paper.

45. Lithia, with an increase in the manufacture of lithia.

46. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

47. Charcoal, with an increase in the manufacture of charcoal.

48. Sulfite paper, with an increase in the manufacture of sulfite paper.

49. Lithia, with an increase in the manufacture of lithia.

50. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

51. Charcoal, with an increase in the manufacture of charcoal.

52. Sulfite paper, with an increase in the manufacture of sulfite paper.

53. Lithia, with an increase in the manufacture of lithia.

54. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

55. Charcoal, with an increase in the manufacture of charcoal.

56. Sulfite paper, with an increase in the manufacture of sulfite paper.

57. Lithia, with an increase in the manufacture of lithia.

58. Sulphuric acid, with an increase in the manufacture of sulphuric acid.

59. Charcoal, with an increase in the manufacture of charcoal.

60. Sulfite paper, with an increase in the manufacture of sulfite paper.

The method of election is peculiar, being based in part upon the national presidential model. Each county or legislative district casts as many electoral votes as it has members in the state house of representatives, and a majority of both the electoral and the popular vote is required. If no one has such a majority, the house of representatives chooses one of the two who have received the highest number of popular votes; but this is really a provision never executed, as the Democratic nominees are always elected without any serious opposition.

The governor is empowered to call extraordinary sessions of the legislature, to grant pardons and reprieves, and to exercise a power of veto which extends to items in appropriation bills; a two-thirds majority of the legislature is necessary to pass a bill over his veto. His appointing power is not very extensive, as nearly all officials, except judges, are elected by popular vote.

The legislature consists of a senate and a house of representatives, chosen every four years. It meets in regular session quadrennially, in special sessions in the middle of the interval to pass the appropriation and revenue bills, and in extraordinary session whenever the governor sees fit to call it. Revenue measures may originate in either house, but a three-fifths vote in each is necessary to their enactment. The constitution goes into minute detail in prohibiting local, private and special legislation.

The judiciary consists of a supreme court of three judges, thirteen (1908) circuit courts, seven (1908) chancery courts, county courts and justice of the peace courts. Under the constitution of 1890 the governor, with the consent of the senate, appoints supreme court judges for a term of nine years, and circuit and chancery judges for four years. The local judicial authorities are the county board of supervisors of five members and the justices of the peace.

The other county officials are the sheriff, coroner, treasurer, assessor, surveyor and superintendent of education. The superintendent is chosen by the state board of education except in those counties (now all or nearly all) in which the legislature has made the office elective. The courts have interpreted this to mean that the manner of selection need not be uniform (Wire v. Perry Miss., 372), a rule which would possibly apply to other local offices. The intention seemed to be to prevent the appointment of officials in counties and districts where there was any likelihood of negro supremacy.

Mississippi has taken a leading part in the movement to bring about the removal of the evils and disabilities of married women. The first statute for that purpose has been passed in 1839. Under the present constitution they are "fully emancipated from all disability on account of coverture," and are placed on an equality with men. Bills in process of legislation in both houses tend to increase the disabilities of the state. A marriage law is based on the old English law, but the modern tendency is toward lessening the disabilities of women. The laws governing marriage and divorce are extensively altered, and the divorce law is most liberal in the United States. The law is based on the New York law, and is intended to be liberal. The laws governing wills are also much altered, and the laws governing the disposition of property after death are also liberal in the United States. The laws governing the disposition of property after death are also liberal in the United States. The laws governing the disposition of property after death are also liberal in the United States.
appointed once every four years by the governor. The charitable institutions of the state are supervised by separate boards of trustees appointed by the governor. The state insane hospital, opened at Jackson in 1836 (act of 1834), in time became overcrowded and the severe conditions of life in the workhouse there led to its abandonment in 1855. The Mississippi State Penitentiary was founded in 1838 (act of 1837). The state institution for the education of the deaf and dumb (1854) and the state institution for the blind (1848) are at Jackson. State aid is given to the house for the incurably ill, and Natchez.

Education.—Educational interests were almost entirely neglected during the colonial and territorial periods. The first school established in the state was Jefferson College, near Jefferson, Alabama, about 1815. Charities have been granted to schools in Claiborne, Wilkinson and Amite counties in 1809-1815, and to Port Gibson Academy and Mississippi College, at Clinton, in 1826. The public school system, established in 1845, never was universal, because of special legislation for various counties or parishes; the highest education was retarded during the Civil War and the Reconstruction period (when immense sums appropriated for schools were grossly mismanaged), but conditions gradually improved after 1875, especially through the concentration of schools. The sessions of the state legislature are necessary to establish the school fund. An act of Congress of the 3rd of March 1803 reserved from sale section sixteen of the public lands in each township for educational purposes. When the Chickasaws ceded their lands to the United States in 1830, the state legislature appropriated a portion of the purchase price to the sixteenth sections, and in 1856 received 174,550 acres—one thirty-sixth of the total cession of 6,283,804 acres. The revenue derived from the sales and leases of this land constitutes and endowment fund for the support of schools in the Chickasaw territory in the northern part of the state.

Among the institutions for higher education are the university of Mississippi (founded 1848), Oxford (opened 1845), opened to women in 1852; the Agricultural and Mechanical College (opened 1880), at Agricultural College, near Starkville, Oktibbeha county; the Industrial Institute and College for Girls (opened 1888), at Columbus; and the Alcorn Agricultural and Mechanical College, for Negroes (1871; reorganized in 1878), at Westside. In 1819 Congress granted thirty-six sections of public land for the establishment of a university. This land was sold in 1833 for $777,332.52, but the proceeds were lost in the Panic of 1837. The Plaquemine Institute (1840). In 1880 the state assumed liability for the full amount plus interest, and this balance, $344,061.23, now constitutes an endowment fund, upon which the state pays 6% interest. Congress granted another township (thirty-six sections) for the university in 1852. The state has expended $2,475,955.72 on educational institutions for current expenses and special needs. The two agricultural and mechanical colleges were founded by the sale of public lands given by Congress under the Morrill Act of 1862. An agricultural experiment station was established in 1884 at Mississippi State Agricultural College; and there are branch experiment stations at McNeill, Pearl River county (1906), near Holly Springs, and at Stoneville, near Greenville.

The sources of revenue are taxes on realty, personal property, and corporations, a poll-tax, and licences. The more important expenditures are for public schools, state departments, educational and charitable institutions and pensions for Confederate soldiers. The budget for the fiscal year 1905-1906, $5,292,825, is approximately $1,100,000 in excess of previous years, and the state has a surplus of $1,400,000. The Bank of Mississippi, at Natchez, was incorporated by the Territorial legislature in 1809, was rechartered by the state in 1818, and was guaranteed a monopoly of the banking business until 1840. In 1834 it was authorized to issue paper money, and in 1837 its charter was renewed by the legislature. In 1839 it was capitalized at $15,900,000. The state subscribed $4,000,000, which was raised on bonds sold to Nicholas Biddle, president of the United States Bank of Pennsylvania. As the Union Bank was founded in the midst of an financial panic and was mismanaged, its failure was a foregone conclusion. Agitation for repudiation was begun by Governor A. G. McNutt (1801-1848), and that question became the chief issue in the gubernatorial campaign of 1841, Tilghman M. Tucker (1802-1859), the Democratic candidate, representing the repudiators, and David O. Shattuck, Whig, representing the anti-republiators. The Democrats were successful, and the bonds were formally repudiated in 1842. In 1853 the High Court of Chancery decided against the error in the testimony by which the state claimed that the shares of stock in the Mississippi, Natchez and St. Louis Bank were sanctioned by the constitution of 1890. The $7,000,000 saved in this manner has doubtless been more than offset by the additional interest charges on subsequent loans, due to the loss of public confidence in the Bank of Mississippi, and in the other Southern states during the Reconstruction period; but expenditures since from $65,210.71 in 1869 to $729,046,34 in 1871. At the close of the Republican régime in 1876 its total indebtedness was $2,631,704.24, of which $814,743 belonged to the Chickasaw fund (see above), and $715,612.22 to the general schools; and the principal of these funds is never to be paid, the real debt was slightly over $1,000,000. On the 1st of October 1907 the payable debt was $1,253,029.07, the non-payable $2,336,197.58, a total of $3,590,226.65. Since the Civil War the banking laws have become more stringent and the national banks have exercised a wholesome influence. There were, in 1906, 24 national banks and 269 state banks, but no trust companies, private banks or savings banks.

History.—At the beginning of the 16th century the territory included in the present state of Mississippi was inhabited by three powerful native tribes: the Natchez in the south-west, the Choctaws in the south-east and centre, and the Chickasaws in the north. In addition, there were the Yazoo in the Yazoo valley, the Pascagoulas, the Biloxis, and a few weaker tribes on the borders of the Mississippi Sound. The history of Mississippi may be divided into the period of exploration (1540-1699), the period of French rule (1699-1763), the period of English rule (1763-1781), the period of Spanish rule (1781-1798), the territorial period (1798-1817), and the period of statehood (1817 seq.).

Hernando de Soto (c.v.) and a body of Spanish adventurers crossed the Tombigbee river, in December 1540, near the present city of Columbus, marched through the north part of the state, and reached the Mississippi river near Memphis in 1541. In 1673 a French expedition organized in Canada under Jacques Marquette, and Louis Joliet sailed down the Mississippi to the mouth of the Arkansas, and nine years later (1682) René Robert Cavelier, sieur de la Salle, reached the mouth of the river, took formal possession of the country which it drains, and named it Louisiana in honour of Louis XIV. The first European settlement in Mississippi was founded in 1699 by Pierre Le Moyne, better known as Iberville, at Fort Maurepas (Old Biloxi) on the north side of Biloxi Bay, in what is now Harrison county. The site proving unfavourable, the colony was transferred to Twenty-seven Mile Bluff, on the Mobile River, in 1702, and later to Mobile (1710). The oldest permanent settlements in the state are (New) Biloxi (c. 1712), situated across the bay from Old Biloxi and nearer to the Gulf, and Natchez or Fort Rosalie (1716). During the next few years Fort St Peter and a small adjoining colony were established on the Yazoo River in Warren county, and some attempts at settlement were made on Bay St Louis and Pascagoula Bay. The efforts (1712-1721) to foster colonization and commerce through trading corporations established by New France on the northwestern coast of Florida came again under the direct control of the king. It grew very slowly, partly because of the hostility of the Indians and partly because of the incapacity of the French as colonizers. In 1729-1730 the Natchez tribe destroyed Fort St Peter, and some of the small outposts, and almost destroyed the Fort Rosalie (Natchez) settlement.

At the close of the Seven Years' War (1763) France ceded to Great Britain the whole territory east of the Mississippi except New Orleans, and Spain ceded Florida to Great Britain. By a royal proclamation (Oct. 7, 1763) these new possessions were divided into East Florida and West Florida, the latter lying S. of the 31st parallel and W. of the Chattahoochee and Apalachicola rivers. Crown orders of 1764 and 1767 extended the limits N. to

1 The increase is due mainly to the assumption of the university obligations in 1880.
a line due E. from the mouth of the Yazoo at about 32° 28' N. lat. Under English rule there was an extensive immigration into this region from England, Ireland, Germany and South Carolina. A settlement was made on the Big Black, 17 m. from its mouth, in 1774 by Phineas Lyman (1716-1754) of Connecticut and other "military adventurers," veterans of the Havana campaign of 1762; this settlement was loyal during the War of Independence. Spain took military possession in 1781, and in the Treaty of Paris (1783) both of the Floridas were ceded back to her. But Great Britain recognized the claims of the United States to the territory as far south as the 31st parallel, the line of 1763. Spain adhered to the line of 1764-1707, and retained possession of the territory in dispute. Finally, in the treaty of San Lorenzo el Real (ratified 1796) she accepted the 1763 (31°) boundary, and withdrew her troops in 1798. Mississippi Territory was then organized, with Winthrop Sargent as governor. The territorial limits were extended on the north to the state of Tennessee in 1804 by the acquisition of the western cessions of South Carolina and Georgia, and on the south to the Gulf of Mexico by the seizure of West Florida in 1810-1811, but were restricted on the east by the formation of the Territory of Alabama in 1817. Just after the uprising of 1797-1798 the French, with the help of the Chactaws, had destroyed the Natchez nation, and the shattered remnants were absorbed by the neighboring tribes. The Chickasaws ceded their lands to the United States in 1816 and the Chactaws theirs in 1830-1832; and they removed to the Indian Territory. The smaller tribes have been exterminated, absorbed or driven farther west.

An Enabling Act was passed on the 1st of March 1817, and the state was formally admitted into the Union on the 10th of December. The first state constitution (1817) provided a high property qualification for governor, senator and representative, and empowered the legislature to elect the judges and more important state officials. In 1822 the capital was moved from Jackson to Columbia, Marion county. The constitution of 1832 abolished the property qualification for holding office and provided for the popular election of judges and state officials. Mississippi thus became one of the first states in the Union to establish an elective judiciary. The same constitution prohibits the importation of negro slaves from other states; but this prohibition was never observed. The United States Supreme Court held that it was ineffective without an act of the legislature. On the death of John C. Calhoun in 1850 the state, under the leadership of Jefferson Davis, began to rival South Carolina as leader of the extreme pro-slavery States Rights faction. There was a brief reaction: Henry Stuart Foote (1800-1856), Unionist, was elected governor in 1851 over Davis, the States Rights candidate, and in the same year a Constitutional Convention had declared almost unanimously that "the asserted right of secession" is "utterly unsanctioned by the Federal Constitution." But the particularistic sentiment continued to grow. An ordinance of secession was passed on the 6th of January 1861, and the constitution was soon amended to conform to the new constitution of the Confederate States. During the Civil War battles were fought at Corinth (1862), Port Gibson (1863), Jackson (1863) and Vicksburg (1863). In 1865 President Johnson appointed provisional governor William Lewis Sharkey (1807-1873), who had been chief justice of the state in 1832-1850, and a convention which assembled on the 14th of August recognized the "destruction" of slavery and declared the ordinance of secession null and void. The first reconstruction legislature met on the 16th of October 1865, and at once proceeded to enact stringent vagrancy laws and other measures against the freedmen; these laws the North interpreted as an effort to restore slavery. Under the Reconstruction Act of the 2nd of March 1867 Mississippi with Arkansas formed the fourth military district, commanded successively by Generals E. O. C. Ord (1867), Alvan C. Gillem (1868) and Irvin McDowell (June-July 1868), and by Gillem (1868-1869) and Adelbert Ames (1869-1870). The notorious "Black and Tan Convention" of 1868 adopted a constitution which conferred suffrage upon the negroes and by the imposition of test oaths disfranchised the leading whites. It was at first rejected at the polls, but was finally ratified in November 1869 without the disfranchising clauses. The fourteenth and fifteenth amendments to the Federal Constitution were ratified in 1870, and the state was formally readmitted into the Union on the 23rd of February of that year.

From 1870 to 1875 the government was under the control of "carpet-baggers," negroes and the most disreputable among the native whites. Taxes were increased—expenditures tripled—thereby creating an overwhelming financial burden under the provisions of the Constitution of 1868. Governor Ames was impeached and removed from office; T. W. Cardoza, another negro, superintendent of education under Ames, was impeached on charges of malfeasance, but was permitted to resign. Governor Ames, when the impeachment charges against him were dismissed on the 29th of March 1876, immediately resigned. The whites maintained their supremacy by very dubious methods until the adoption of the Constitution of 1890 made it no longer necessary. The state has always been Democratic in national politics, except in the presidential elections of 1840 (Whig) and 1872 (Republican). The electoral vote was not counted in 1864 and 1868.

1 South Carolina ceded its western lands to the United States in 1787 and Georgia in 1802. The government added them to Mississippi in 1804. The seizure of West Florida was supplemented by the treaty of 1821, in which Spain abandoned her claim to Florida.

2 The seats of government have been Natchez (1798-1802), Washington (1802-1817), Natchez (1817-1821), Columbia (1821-1822), Jackson (1822 seq.).

3 This system proved unsatisfactory, and in 1869 was aban-
donated.

4 Under the constitution of 1832 the president of the senate succeeded the governor in case of a vacancy.

5 Governor Quitman resigned because of charges against him of aiding Lee's expedition against Cuba.

6 On the 4th of November the term for which Guion had been elected as a senator expired and he was succeeded in the governorship by Whitefield, elected by the senate to be his president.

7 Served from the 5th of January (when Poole resigned) to the 10th, when McRae was inaugurated.

1904) Lake Tana, the nation's oldest national monument, was established in 1905. It is located in the Black Hills of South Dakota. It is known as the cradle of American Indian culture and is home to the White River Indian Reservation. The park is known for its scenic beauty and its cultural heritage. It covers an area of 15,000 acres, and it is open year-round. It is a place where visitors can experience the history, culture, and landscape of the American Indian people.

² Removed from office by Federal troops, 22nd of May 1863; W. L. Sharkey was appointed provisional governor by President Johnson.

³ Resigned 30th of November 1871.

⁴ Resigned 29th of March 1876; succeeded by the president of the senate.

¹ The name is from the Algonkin missi-sepp, literally "father of waters."
not, as had been supposed, in Louisiana, serve as reservoirs to diminish the maximum wave in great flood seasons. Furthermore, the report argued that no diversion of tributaries was possible; that no reservoirs artificially constructed could keep back the spring freshets which caused the floods; that the making of cut-offs, which had sometimes been advocated as a measure of relief, was in the highest degree injurious; that outlets were impracticable from the lack of suitable sites; and, finally, that levees properly constructed and judiciously placed would afford protection to the entire alluvial region.

During the Civil War (1861–65) the artificial embankments were neglected; but after its close large sums were expended by the states directly interested in repairing them. The work was done without concert upon defective plans, and a great flood early in 1874 inundated the country, causing terrible suffering and loss. Congress, then in session, passed an act creating a commission of five engineers to determine and report on the best system for the permanent reclamation of the entire alluvial region. Their report, rendered in 1875, endorsed the conclusions of that of 1861, and advocated a general levee system on each bank. This system comprised: (1) a main embankment raised to specified heights sufficient to restrain the floods; and (2) where reasonable security against caving required, considerable areas near the river to be thrown out, exterior levees of such a height as to exclude ordinary high waters, but to allow free passage to great floods, which as a rule occur only at intervals of five or six years. An engineering organization was proposed for constructing and maintaining these levees, and a detailed topographical survey was recommended to determine their precise location. Congress promptly approved and ordered the survey; but strong opposition on constitutional grounds was raised to the construction of the levees by the government.

In the meantime complaints began to be heard respecting the low-water navigation of the river below the mouth of the Ohio. A body of five army engineers, appointed in 1875 to consider a plan of relief, reported that a depth of 10 ft. could probably be secured by narrowing the wide places to about 3,500 ft. with hurdle work, brush ropes or brush dykes designed to cause a deposit of sediment, and by protecting caving banks by light and cheap mattresses. Experiments in these methods were soon begun and they proved to be effective.

The bars at the efflux of the passes at the mouth of the Mississippi were also serious impediments to commerce. The river naturally discharges through three principal branches, the south-west pass, the south pass and the north-east pass, the latter through two channels, the more northerly of which is called Pass à l'Outre. In the natural condition the greatest depth did not exceed 12 or 13 ft. After appropriations by Congress in 1837, 1852 and 1856, a depth of 15 ft. was finally secured by dredging and scraping. The report of 1875 discussed the subject of bar formation at length, and the stirring up of the bottom by scrapers during the flood stages of the river (six months annually) was recommended by it. After the war this recommendation was carried into effect for several years, but experience showed that not much more than 18 ft. could be steadily maintained. This depth soon became insufficient, and in 1873 the subject was discussed by a board of army engineers, the majority approving a ship canal. In 1874 Congress constituted a special board which, after visiting Europe and examining similar works of improvement there, reported in favour of constructing jetties at the south pass, substantially upon the plan used by Pieter Caland (b. 1826) at the mouth of the Meuse; and in 1875 Captain James B. Eads (1820–1887) and his associates were authorized by Congress to open by contract a deep channel through the south pass upon the general plan proposed by this board. As modified in 1878 and 1879 the contract called for the maintenance of the navigation of the river for twenty years of a channel through the pass and over the bar not less than 26 ft. in depth throughout, a width of not less than 200 ft. and with a middle depth of 30 ft. The work was begun on the 2nd of June 1875. The required depth was obtained in 1879, and with few interruptions has been maintained. In 1902 Congress authorized preparations for the construction of a deeper (35 ft.) and a wider channel through the south-west pass; the work was begun in 1903 and virtually completed in 1909.

In the year in which Captain Eads opened the south pass of deep-water navigation Congress created a commission of seven members for considering plans for constructing a channel in the Mississippi, for protecting its banks and for preventing floods, and since then large expenditures for improvement between the head of the passes and the mouth of the Ohio have been under the control of this commission. During the first Grant administration the plan of levees, woven like basket-work, were sunk on the portion of the bank at the time under water, by throwing rubble stone upon them, an excess of stone being used. A common size of mattress was 800 ft. long, 30 ft. wide and 20 ft. high, the bottom of the slot was 300 ft. was used, and lengths had reached 2000 ft. The depth of water was often from 60 to 100 ft. At first these mats were light structures, but the loss of large quantities of bank protection by the caving of the bank behind them, or by scour at their channel edges, forced the commission steadily to increase the thickness and height of the mattress, so that the cost of the linear foot of bank protection, measured along the bank, rose from $2.50 to $300 in the later work. The contraction works adopted were systems of spurs or pile dykes, running out from the shore nearly to the line of the proposed channel. Each dyke consisted of one to four parallel rows of piles, the interval between rows being about 20 ft. and between the piles in the row 3 or 4 ft. The piles at the bottom were strongly braced and tied together, and in many cases brush was woven into the upper row, forming a hurdle, in order further to diminish the velocity of the water below the spur. By 1893 it was evident that the materials which had been used at first and which was estimated would really be several times that amount, and that the works would require heavy expense for their maintenance and many years for their execution. Navigation interests demanded more speedy relief. On the recommendation of the Grant administration, and in 1896 it adopted a project for maintaining a channel from the mouth of the Ohio to the passes that should be at least 9 ft. deep and 250 ft. wide throughout the year. Centrifugal pumps are used, and the pipes being between piled and stern were connected through a line of pipes about 1000 ft. long, supported on pontoons. Water jets or cutters stir up the material to be dredged before it enters the suction pipes. The later dredges have a capacity of about 1,000,000 cu. ft. per second. These dredges begin work on a bar where trouble is feared before the river reaches its lowest stage, and make a cut through it. A common cut is 2000 ft. long by 250 ft. wide, and 3 or 4 ft. deep. Since 1903 a channel of the proposed depth or more has been maintained.

The occurrence of the greatest floods known on the Mississippi, and extensive measurements of it, were made. A maximum flood of 1,900,000 cu. ft. per second crossed the latitude of Cairo. Much of it escaped into the bottom lands, which are below the level of the main stream. The flood waters, except in the lower river below. The flow in the river proper at Lake Providence, 542 m. below Cairo, was thus reduced to about 1,000,000 cu. ft. per second, while it had been confined by levees the flow between them would have been double, or about 2,000,000 cu. ft. per second. The volume of the leveses in 1852 was about 33,300,000 cu. yds., and by the 30th of June 1908 had been increased to 219,621,594 cu. yds., of which the United States had built about one-half, and expended on them $24,562,444. The length of the levees is about 1486 m., and they are continuous save where interrupted by tributaries or by high lands, from New Madrid, or 80 m. below Cairo, to Fort Jackson, 1393 m. below Cairo. The width of the levees varies greatly; in many places the levees are built much near the normal margin of the river than is consistent with keeping the flood heights as low as possible. This has arisen from two causes: firstly, to give protection to lands already cultivated, which lie usually near the bank of the river; secondly, to avoid the lower ground, which, owing to the peculiar formation, is found as one goes back from the river. Another bad result of this nearness of the leveses to the bank of the river is the loss of land by caving one of the levees. This losses 10,000,000 cu. yds. in 1904–1905, and can only be prevented by bank protection, costing $150,000 per mile, to protect a levee perhaps 16 ft. high costing about $30,000 per mile. The levees have top widths of 8 ft. side, and are built three, four, or five on top of each other about 10 ft. The grades of the levees are usually 3 ft. above the highest water, and have to be raised from year to year as greater confinement of water gives greater flood heights. When this system is completed for levees and dikes the height of the river will be raised by exceeding 10 ft. In 1899, after about $28,000,000 had been spent on levees by the United States and by the local authorities, the commission submitted an estimate for additional work on levees, amounting to $34,000,000, and costing $22,000,000. The effect of the levees has been to increase flood heights. Though the

MISSISSIPPI RIVER

605
Mississippi River Commission was forbidden by Congress to build levees to protect lands from overflow, a majority of its members believed them useful for the purpose of navigation improvement. They have, however, effected no sensible improvement in the navigation of the river at low ft. deep, and at other stages no improvement was needed for the purposes of navigation. Neither of those channels was a destrucitve flood in 1897 and again in 1903. By the 30th of June 1908, $57,510,216.81 had been appropriated for the commission's work.

From the mouth of the Ohio to the mouth of the Missouri, a distance of about 210 m., the river is affected by back water from the Ohio which increases the depth of sediment, and although the banks increase in height above Cape Girardeau the channel was in its nature much shallower. Mile after mile they proceeded and were constructed by bars on which the low-water depth was only 3 ft. The improvement was begun in 1872, and in 1881 a project was adopted for narrowing the channel to approximately 2500 ft. It was for 8 years in turn and to the present time, but before 1881 was discontinued, because of a new plan for a channel 14 ft. deep from the Great Lakes to the Gulf.

The Upper Mississippi carries only a small amount of sediment and was navigable in its natural state to St. Paul. Although low water the larger river boats could ascend no farther than La Crosse, Wisconsin. In 1879 Congress adopted a project for obtaining a channel with a minimum depth at low water of 44 ft., chiefly by means of contraction, dredging, the construction of a later canal at the Rapids, and the enlargement of that at Des Moines Rapids with a view to obtaining a channel nowhere less than 6 ft. in depth at low water by means of two locks and dams, which were begun in 1894 and were about two-thirds completed in 1898, a right of way of the same depth will be extended from St. Paul to Minneapolis. The United States government has constructed dams at the outlets of lakes Winnibigoshish, Cass, Leech, Pine, Sandy and Pokegama, and has several areas with reservoirs having a total storage capacity of about 95,000,000,000 cub. ft. This reservoir system, which may be much enlarged, is also beneficial in that it mitigates floods and regulates the flow for manufacturing purposes and for logging.

Along the river there was expenditure of more than $70,000,000 on the Mississippi river between the mouth of the Missouri and the head of the passes, the improvement of navigation thereon has not been great enough to make it possible for river freighting to compete favorably with rail transportation, and it is no longer merely a question of competition. The productivity of this region has become so enormous that railways alone cannot meet the requirements of its commerce, and a persistent demand has arisen for a greater depth in the great lakes to the Gulf. The first great impetus to this demand was given in 1890, when a canal 24 ft. in depth, and known as the Chicago Drainage Canal, was opened from the Chicago river to Lockport, Illinois, on the Des Plaines river. In 1907 Congress appropriated $200,000 for the Mississippi River Commission to make a survey and prepare plans, with estimates of cost, for a navigable waterway 14 ft. in depth from Lockport to St. Louis. The commission reported favourably in 1905, and in 1907 Congress provided for another canal with similar dimensions, with a single lock on the channel, estimating that it would cost $128,000,000 for construction and $6,000,000 annually for maintenance, and considered a 9-ft. channel (8 ft. between Ohio and St. Louis) sufficient for commercial purposes.

The Ohio is commercially the most important tributary, and in flood time most of the commerce on the Lower Mississippi consists of coal and other heavy freight received from the mouth of this river. Its navigation at low water has also been improved by dredging, rock excavation and contraction works. In its upper reaches a channel 9 ft. in depth had been obtained before 1909 by the construction of a number of locks with collapsible dams which were thrown down in the locks in the night. This improved the channel from the Missouri to the mouth of the river, and it has been estimated that a channel 12 to 14 ft. in depth may ultimately be obtained by a system of mountain reservoirs. Furthermore, the government has given to a company (for the reason that the Ohio at Pittsburgh is 10 ft. in depth. The Mississipi is navigable from its mouth to Fort Benton, a distance of 2285 m., and it has become a very important highway of commerce. When the first railway, the Hannibal & St. Joseph, reached it in 1856, the demand for deep water was manifest, and regular navigation between Kansas City and St. Louis was re-established in 1907 and a demand has arisen for a 12-ft. channel from the mouth of the river to Sioux City, Iowa. The Red, Arkansas, White, Tennessee, and Cumberland rivers, which are parts of the Mississippi system, have each a navigable mileage exceeding 600 m.

History.—Although the Mississippi river was discovered in its lower course by Hernando de Soto in 1541, and possibly by Alonso Alvarez de Pineda in 1519, Europeans were not yet prepared to use the discovery, and two Frenchmen, Louis Joliet and Father Jacques Marquette, first made it generally known to the civilized world by a voyage down the river from the mouth of the Wisconsin to the mouth of the Arkansas in 1563. In 1680 Louis Hennepin, sent by La Salle, who planned to acquire for France the entire basin drained by the great river and its tributaries, explored the river from the mouth of the Illinois to the Falls of St. Anthony, where the city of Minneapolis stands, and a few years later La Salle himself descended from the mouth of the Illinois to the Gulf, named the basin "Louisiana," and took formal possession of it in the name of his king, Louis XIV. By the war which terminated (1763) in the Treaty of Paris, Great Britain wrested from France all that part of the basin lying east of the middle of the river (except the island of New Orleans at its mouth), together with equal rights of navigation; and the remainder of the basin France had secretly ceded to Spain in 1762. During the War of Independence the right to navigate the river became a troublesome question. In 1779 the Continental Congress sent John Jay to Spain to negotiate a treaty of commerce, and to insist on the free navigation of the Mississippi, but the Spanish government refused to entertain such a proposition, and new instructions that he might forego that right south of 31° N. latitude reached him too late. While the commissioners from Great Britain and the United States were negotiating a treaty of peace at Paris, Spain, apparently supported by France, sought to prevent the extension of the western boundary of the United States to the Mississippi, but was unsuccessful, and the United States acquired title in 1873 to all that portion of the basin east of the Continental Congress, having received the mouth of the river and north of 31° N. lat. In 1783 Congress appointed John Jay to negotiate a treaty with Don Diego de Garrodi, the Spanish minister to the United States, but the negotiations resulted in nothing. For the next ten years the Spaniards imposed heavy burdens on the American commerce down the Mississippi, but in 1794 James Monroe, the United States minister to France, procured the aid of the French government in further negotiations, for which Thomas Pinckney had been appointed envoy extraordinary, and in 1795 Pinckney negotiated a treaty which granted to the United States the free navigation of the river from its source to the Gulf and the privilege of depositing American merchandise at the port of New Orleans or at some other convenient place on the banks. Spain retroceded Louisiana to France in 1800, but the Louisiana Purchase in 1803 left very little of the Mississippi basin outside of the United States.

As the headwaters of the river were not definitely known, the United States government sent Zebulon M. Pike in 1805 to explore the region, and on reaching Leech Lake, in February 1806, he pronounced that the main source. In 1820 Lewis Cass, on the frontier of Michigan territory, which then had the Mississippi for its western barrier, conducted an expedition into the same region as far as Cass Lake, where the Indians told him that the true source was about 50 m. to the W.N.W., but as the water was too low to proceed by canoe he returned, and it remained for Henry Schoolcraft, twelve years later, to discover Lake Itasca, which occupies a low depression near the centre of the basin in which the river takes its rise. Jean N. Nicollet, while in the service of the United States government, visited Lake Itasca in 1836, and traced its principal affluent, since known as Nicollet's Infant Mississippi river, a few miles S.S.W. from the lake's western arm. Jacob Vrdenberg Brower (1844-1900), who was commissioned by the Minnesota Historical Society in 1885 to make a more detailed survey, traced the course from Nicollet's Infant Mississippi to the greater ultimate reservoir, which contains several lakes, and lies beyond Lake Itasca, 2535 m. by water from the Gulf of Mexico, and 1558 ft. above the sea. Soon after this survey the state of Minnesota created Itasca State Park, which contains both Itasca Lake and its affluent from the south.

It seems probable that Joliet and Marquette were preceded by two other Frenchmen, Pierre Esprit Radisson and Menard Chouart des Groseilliers, who apparently reached the Upper Mississippi in 1661, but their claim to priority has been the subject of considerable controversy, and, at all events, there was no general knowledge of the river until after the voyage of Joliet and Marquette.
MISSOLONGHI—MISSOURI

From the close of the 17th century until the building of the first railways in the Mississippi basin, in the middle of the 19th century, the waterways of the Mississippi system afforded practically the only means of transportation. During the 18th century, with the French occupancy trade with the Indians was the only important industry, and this was carried on almost wholly with birch canoes and a few pirogues; but by 1790 immigrants were coming in considerable numbers both by way of the Great Lakes and the mouth of the Mississippi, and to meet the demands of a rapidly expanding commerce barges and keelboats were introduced. The development of the Mississippi Valley must have been slow until the railways came had it not been for the timely application of the power of steam to overcome the strong current of the Lower Mississippi. Even without the steamboat, however, the Mississippi was indispensable to the early settlers, and the delay of the United States in securing for them its free navigation resulted in threats of separation from the Union. The most formidable movement of this kind was that of 1787–1788, in which James Wilkinson, who had been an officer in the War of Independence, plotted for a union with Spain. Steamboat navigation on this river system was begun in 1811, when the "New Orleans," which had been built by Nicholas Roosevelt (1767–1834), made the trip from Pittsburg to New Orleans, but it was six years later before the steamboat was sufficiently improved to ascend to St. Louis. In 1817 the commerce from New Orleans to the Falls of the Ohio, at Louisville, was carried in barges and kept up with a capacity of 6 to 8 tons each, and 3 to 4 months were required to make a trip. In 1820 steamboats were making the same trip in 15 to 20 days, by 1825 in 6 days or less; and in 1834 there were 230 steamboats, having an aggregate tonnage of 30,000 tons, engaged in trade on the Mississippi. Large numbers of flat boats, especially from the Ohio and its tributaries, continued to carry produce down stream; an extensive canal system in the state of Ohio, completed in 1842, connected the Mississippi with the Great Lakes; these were connected with the Hudson river and the Atlantic Ocean by the Erie Canal, which had been open since 1825. Before the steamboat was successfully employed on the Mississippi the population of the valley did not reach 2,000,000, but the population increased from approximately 2,500,000 in 1830 to more than 6,000,000 in 1840, and to 14,000,000 or more in 1860. The well-equipped passenger boats of the period immediately preceding the Civil War were also a notable feature on the Ohio and the Lower Mississippi.

In the Civil War the Lower Mississippi, the Ohio, and its two largest tributaries—the Cumberland and the Tennessee—being still the most important lines of communication westward and across the Appalachian Mountains, determined largely the movements of armies. The adherence of Kentucky to the Union excluded the Confederacy from the Ohio, but especially disastrous was the fall of Vicksburg and Port Hudson, whereby the Confederacy was cut in two and the entire Mississippi became a Federal highway. Under Federal control it was closed to commerce, and when the war was over the prosperity of the South was temporarily gone and hundreds of steamboats had been destroyed. Moreover, much of the commerce of the West had been turned from New Orleans, via the Mississippi, to the Atlantic seaboard, via the Great Lakes and by new lines of railways, the number of which rapidly increased. There was, of course, some revival of the Mississippi commerce immediately after the war, but this was checked by the bar at the mouth of the south-west pass. Relief was obtained through the Eads jetties at the mouth of the south pass in 1879, but the facilities for the transfer of freight were far inferior to those employed by the railways, and the steamboat companies did not prosper. But at the beginning of the 20th century the prospects of communication with the western coast of North America and South America, and with the Orient by way of an isthmian canal, the inadequate means of transportation afforded by the railways, the efficiency of competing waterways in regulating freight rates, and the consideration of the magnificent system of inland waterways which the Mississippi and its tributaries would afford when fully developed, have created the strong demand for river improvement.

MISSOLONGHI, or MESOLONGHI (Μεσολόγγιον), the chief town of the monarchy of Aetarnia and Aetolia, Greece. It is on the N. side of the Gulf of Pataras, about 7 m. from the coast; pop., about 8,000. The place is notable for the siege which Mavrocordato and Botzaris sustained in 1822 and 1823 against a Turkish army 11,000 strong, and for the more famous defence of 1825–26. Byron died here in 1824, and is commemorated by a cenotaph and a statue.

MISSOULA, a city and the county-seat of Missoula county, Montana, U.S.A., on the Clark Fork of the Columbia (here called the Missoula river), about 125 m. W.N.W. of Helena. Pop. (1900), 3,666 (2,020 foreign-born); (1910), 12,869. It is served by the Chicago, Milwaukee & Puget Sound railway and by the Northern Pacific railway, which has shops here and of which Missoula is a division headquarters. There is an electric railway from Missoula to Hamilton, about 48 m. south. The Northern Pacific railway maintains a large brick freight house and St Patrick's hospital is maintained by sisters of charity. Missoula is about 35 ft. above sea-level, with Mount Jumbo immediately north, and University Mountain immediately south of the Clark Fork, and the Bitter Root range to the west. The city is situated on the bed of a prehistoric lake. Missoula is the seat of the Sacred Heart academy (for girls), of a Christian Brothers' school (for boys), of the Garden City commercial college, and of the state university (founded in 1893, and opened in 1895), which occupies a campus of 40 acres. On the Bitter Root river, 4 m. distant, is the United States army post, Fort Missoula. Missoula has considerable trade with the surrounding country in farming, fruit-growing, lumbering and mining. The Clark Fork furnishes water power, and at Bonner, 6 m. east, is the Clark dam (28 ft.), which furnishes electric power. Missoula was founded in 1864, and chartered as a city in 1887.

MISSOURI, a north-central state of the United States of America, and one of the greatest and richest, and economically one of the most nearly independent, in the Union, lying almost midway between the two oceans, the Gulf of Mexico and Canada. It is bounded N. by Iowa; E. by Illinois, Kentucky and Tennessee; S. by Arkansas; and W. by Oklahoma, Kansas and Nebraska. Its N. and S. limits are mainly coincident with the parallels of 40° and 43° 35' 30" N. lat.—the southernmost boundary, in the S.E. corner, is the meridian of 36° N. lat.—and much of the western border is the meridian of 94° 43' W. long. respectively; but natural boundaries are afforded on the extreme N.E. by the Des Moines river, on the E. by the Mississippi, on the S.E. by the St Francis and on the N.W. by the
Missouri. Altogether, about 830 m., or considerably more than half of the entire boundary, is water-front: about 560 m. along the Missouri, about 208 m. along the Missouri, and about 100 m. along the St Francis and Des Moines. The length of the state from north to south, disregarding the St Francis projection southward, is 282 m,1 the width from west to east varies from 208 to 386 m., and the total area is 69,420 sq. m., of which 603 sq. m. are water surface.

Physical Features.—Missouri has three distinct physiographic divisions: a north-western upland plain, or prairie region; a lowland, in the extreme south-east; and, between these, the Missouri portion of the Ozark uplift. The boundary between the prairie and Ozark regions follows the Missouri river from its mouth to Glasgow, running thence south-westward, with irregular limits, but with a direct trend, to Jasper county at the south-east corner of Kansas; and the boundary between the Ozark and embayment regions runs due south-west from Cape Girardeau.

1. The prairie region embraces, accordingly, somewhat more than one-third of Missouri—i.e., the portion of the state north of the Missouri river—except a few water-remnants. It is a beautiful, rolling country, with a great abundance of streams, more hilly and broken in its western than in its eastern half. The elevation in the extreme north-west is about 1200 ft. and in the extreme south-east about 500 ft. The streams of the south-east, along the border of the Ozark region, has an elevation of about 900 ft. The larger streams have valleys 250 to 300 ft. deep and sometimes 8 to 10 m. broad, the country bordering them being undulating in relief, while the interior is low. The smaller streams have so eroded the whole face of the country that little of the original surface plain is to be seen. The Mississippi river is skirted throughout the length of the state by contours of 400 to 600 ft. elevation.

2. The post-Carboniferous strata and faults are generally horizontal, with minor undulations, dominated by a ridge—or, more exactly, a relatively even belt of highland—that runs from near the Missouri river to Ste Genevieve county to Barry county on the west. The valleys of the streams of the prairie region are lined with a mantle of glacial deposits, generally thick, although in the stream valleys of the north-east the bed-rocks are widely exposed. The southern limits of these glacial deposits is practically the Ozark border, and the deposits of the Missouri river are not of glacial origin.

3. The Ozark region, which comprises the western half of the state, is bordered by the Missouri river, from 40 to 90 m. in width; by the Jordan river, 20 to 40 m. wide; and by several smaller streams. The region is composed of old rock and sedimentary strata, and the surface is composed of sandstone, shale, and limestone. The region is characterized by a low grade of relief and a low grade of erosion. The hills are generally low and rounded, and the valleys are generally narrow and deep. The surface is generally flat and featureless.

4. The Ozark region, which comprises the western half of the state, is bordered by the Missouri river, from 40 to 90 m. in width; by the Jordan river, 20 to 40 m. wide; and by several smaller streams. The region is composed of old rock and sedimentary strata, and the surface is composed of sandstone, shale, and limestone. The region is characterized by a low grade of relief and a low grade of erosion. The hills are generally low and rounded, and the valleys are generally narrow and deep. The surface is generally flat and featureless.

5. The Ozark region, which comprises the western half of the state, is bordered by the Missouri river, from 40 to 90 m. in width; by the Jordan river, 20 to 40 m. wide; and by several smaller streams. The region is composed of old rock and sedimentary strata, and the surface is composed of sandstone, shale, and limestone. The region is characterized by a low grade of relief and a low grade of erosion. The hills are generally low and rounded, and the valleys are generally narrow and deep. The surface is generally flat and featureless.

6. The Ozark region, which comprises the western half of the state, is bordered by the Missouri river, from 40 to 90 m. in width; by the Jordan river, 20 to 40 m. wide; and by several smaller streams. The region is composed of old rock and sedimentary strata, and the surface is composed of sandstone, shale, and limestone. The region is characterized by a low grade of relief and a low grade of erosion. The hills are generally low and rounded, and the valleys are generally narrow and deep. The surface is generally flat and featureless.

7. There has been some controversy as to whether this condition is due to the elevation and corrosion of original flood-plain meanders after their development in a past base-level condition—which theory is probably correct—or to the natural, simultaneous lateral and vertical cut of an originally slightly sinuous stream. Other special conditions of stream declivity and horizontal bedstrata (conditions supposed by some to be peculiarly fulfilled in this region) as would be favorable to the requisite balance of bank cutting and channel incision.
embayment lies in the Austro-riparian area of the same zone. Among wild animals, deer and bear are not uncommon. Opossums, raccoons, woodchucks, foxes, grey squirrels and fox-squirrels are common. The game birds include quail ("Bob White") and pheasants, and waterfowl are especially abundant. Commercial plums, peaches, and turkeys, all very common as late as 1860, are no longer to be found save in remote and thinly-settled districts. A state fish commission has laboured to increase the common varieties of river fish. So far as the data at hand show, certain commercial species have increased in number: carp, fingerlings, and terrapin and turtles, mainly from the counties of the embayment region. Mussel fisheries, an industry confined to the Mississippi river counties from Lincoln to Lewistown, are economically important, as the shells are used in the manufacture of pearl buttons. There are state fish-hatcheries at St. Louis and St. Joseph.

Flora.—The most valuable forests are in the southern half of the state, which, except where cleared for farms, is almost continuously wooded. Some of the most important products of Missouri forests. The finest woods are on the eastern upland and on the Missouri lowlands. The entire woodland area of the state was estimated at 41,000 sq. m. by the national census of 1900. Ash, oaks, black and sweet gums, chestnuts, hickories, hard maple, beech, walnut and short-leaved pine are noteworthy among the trees of the Carolinian area; the tulip and bald cypress of the embayment region, and long-leaf and lobolly pines, pecans and live oaks of the uplands, among those characteristic of the Austro-riparian.

But the habitats overlap, and persimmons and magnolias of different species are common and notable in both areas. The heavy timber in the south-eastern counties (cypress, &c.), and even scattered stands of beech in the north-west, northern white oak and red gum, have already been considerably exploited.

Climate.—Missouri has a continental climate, with wide range of moisture and temperature. The Ozark uplift tempers very greatly the conditions of the south. The average temperature of the area of the state as a whole. The normal mean annual temperature for the entire state is about 54°; the normal monthly means through the year are approximately 23.3, 30.4, 41.5, 52.8, 64.6, 73.4, 77.1, 75.7, 59.3, 44.1, 35.0, 26.9°. The average temperature for the state is 60°, the north-western by one of 50°; and although in the former region sometimes not a day in the year may show an average temperature below freezing-point, at the latter the life of winter is but a few weeks, and at Rockport three. Nevertheless, the yearly means of the five districts into which the state is divided by the national weather service exhibit very slight differences: approximately 52.1, 57.2, 54.3, 52.1, and 51.5°. The climate is most characteristic of the central, south-east, south-west.

On the other hand, the range in any month of local absolute temperatures over the state is habitually great (normally about 10° in the hottest and 10° or more in the coldest), and there are many places with records of absolute extremes higher than 110°, as at Warsaw, Benton county, in February 1905. The average fall of snow, which is mostly within the months from November to March inclusive, ranges from about 8 in, in the south-east counties to 30 in.

The climate of Missouri is determined by the geographic situation of the state. Missouri lies very frequently in the dangerous quadrat of the great cyclonic storms passing over the Mississippi valley,—indeed, northern Missouri lies in the area of maximum frequency of tornadoes.

The region is well watered, although the waters are not very abundant. Rainfall comes from the Gulf of Mexico. The south-east winds blow from the arid lands and carry rising temperatures across the state; and the winter anti-cyclones from the north, which is the great source of cold winds, bring some of the coldest weather. Missouri lies very frequently in the dangerous quadrat of the great cyclonic storms passing over the Mississippi valley,—indeed, northern Missouri lies in the area of maximum frequency of tornadoes.

Minerals.—Coal, lead, zinc, clays, building stones and iron are the most important minerals. Cobalt and nickel are associated with the clays. The coal reserves are estimated to be about 8,000,000 tons, of which 140,000 is in the Ozark region, and is almost exclusively derived from Missouri the production is small in comparison with the amount derived from abroad. Practically the whole comes from Misle La Motte, in Madison county. Missouri has no iron ore. The production of the coal is probably insufficient for the iron-making of the country. But it is of great importance to the state, nevertheless, and its production has possibilities much beyond present realization. The ore occurs in two forms, haematite and magnetite. The haematite is mined almost exclusively in the Ozark region; it is rich in haematite, and the ore is worked for use in the iron industry. The magnetite is found in the Ozarks, and is worked for the manufacture of steel. The iron is found in the Ozarks, and is worked for the manufacture of steel. The iron is found in the Ozarks, and is worked for the manufacture of steel. The iron is found in the Ozarks, and is worked for the manufacture of steel.

The limits of the coal belt have already been defined. The area of the Coal Measures is about 23,000 sq. m., and that of those classified as productive is about 12,000 sq. m., or nearly the entire area of the lower measures. The coal is almost wholly bituminous, with very little cannelite. The seams are generally from one to five feet in thickness. Mazon, Marquette, and Kansas are the leading mining counties. Lead and silver, in order of importance, are next in importance. Lead and silver, in order of importance, are next in importance. Lead and silver, in order of importance, are next in importance. Missouri is one of the leading lead states in the United States, and is extensively worked for the supply of Kansas City and other parts of western Missouri.

Lead occurs in three areas in southern Missouri. In the first, of which St. Francois county is the centre, it occurs generally in disseminated in Cambrian limestone; in the second, of which the counties immediately south-west of Jefferson city are the centre, and the St. Francois and Mineral counties are the leading areas.
it occurs with zinc in reticulated deposits and fissure veins in clays and clastic limestones; and in the third, of which Jasper county is much the most important county, the two metals occur in pockets and joints in the Burlington-Keokuk beds of the sub-Carboniferous. The mineralization is not very great, but the ore is of good quality.

The town of Hannibal, founded in 1806, was named after Napoleon's brother, and is one of the most important centers of the zinc industry in Missouri. The zinc industry began in 1854, and by 1900, the state was the leading producer of zinc in the United States. The zinc ore is found in the Linn, Boone, and Pettis counties, and the production is concentrated in the town of Hannibal.

Missouri has a long history of mining, with the zinc industry being one of the most significant. The state's mining history dates back to the early days of settlement, with the discovery of gold in the mid-1800s.

Manufactures.—Manufacturing and mechanical pursuits absorbed in 1900 $400,000,000, and engaged in one or more occupations, less than half as many as in agriculture. The town of Hannibal, founded in 1806, was named after Napoleon's brother, and is one of the most important centers of the zinc industry in Missouri. The zinc industry began in 1854, and by 1900, the state was the leading producer of zinc in the United States. The zinc ore is found in the Linn, Boone, and Pettis counties, and the production is concentrated in the town of Hannibal.

Missouri has a long history of mining, with the zinc industry being one of the most significant. The state's mining history dates back to the early days of settlement, with the discovery of gold in the mid-1800s.
yrs or more. Thus the foreign element is an old one, and other statistics show that it is being effectively absorbed into the native mass by intermarriage. The German influence has been felt in education and in the anti-slavery cause. The early settlers of the state were practically all from Kentucky, Tennessee, Virginia and the old slave-states of the south-east, and their influence was essentially dominant in the state until well after the Civil War (about 1875), when northerners first began to enter the state in large numbers. The south-western Ozarks were settled originally by mountaineers from Kentucky and Tennessee, and retained a character of social primitiveness and industrial backwardness until after the Civil War. This region has been industrially regenerated by the mine development. In addition to St Louis, Kansas City and St Joseph, the leading cities in 1900 were Joplin, Springfield, Sedalia, Hannibal, Jefferson City, Carthage, Webb City and Moberly. As Missouri was originally a French colony the Roman Catholic is its oldest church; and it is still the strongest with 382,042 communicants in 1906 out of a total of 1,299,230 for all denominations. In the same year there were 218,535 Baptists, 214,004 Methodists, 166,137 Disciples of Christ, 71,590 Presbyterians, 45,018 Lutherans and 32,775 members of the German Evangelical Synod of North America.

Administration. — These constitutions, framed by conventions in 1820, 1865 and 1875, have been adopted by the people of the state, and a fourth (1845) was rejected, principally because it provided for popular election of the state judiciary, which was then appointed. In addition to these four constitutional conventions, mention should be made of the special body chosen in 1861 to decide the question of secession, which retained supreme though irregular control of the state during the Civil War, and some of whose acts had all the force of promulgated constitutional amendments. Universal manhood suffrage was established by the first constitution. The constitution of 1865 was a partisan and intolerant document, a part of the evil aftermath of war; it was adopted by an insignificant majority and never had any strength in public sentiment. The present constitution (that of 1875) was a notable piece of work when framed. The term of the governor and other chief executive officers, which had been four years until the adoption of the constitution of 1865, under which it was two years, was restored to the long term (unusual in American practice). The legislature (or, as it is called in Missouri, General Assembly) had been permitted to hold adjourned sessions under the constitution of 1865. This provision was omitted, and instead various restrictions were placed upon legislative extravagance, and upon financial, special and local legislation generally; and among reform provisions, common enough to-day, but uncommon in 1875, were those forbidding the General Assembly to make irrevocable grants of special privileges and immunities; requiring finance officials of the state to clear their accounts precedent to further eligibility to public office; preventing private gain to state officials through the deposit of public moneys in banks, or otherwise; and permitting the governor to veto specific items in general appropriation bills. The grand jury was reduced to twelve members, and nine concurring may indict. The township system may be adopted by county option, but has not been widely established, though purely administrative (not corporate) "townships" are an essential part of state administration. St Louis and Kansas City have adopted their own charters under constitutional provision. Up to 1909 37 constitutional amendments were submitted to the people for adoption or rejection, and 22 were adopted. Three of these (1900) restrict the calling of the grand jury, permit two-thirds of a petit jury to render verdicts in courts not of record, and three-fourths to give verdict in civil cases in courts of record. Cities have been allowed (1892), upon authorization by the General Assembly, to organize pension home, and the legislature enacted a special act to tax the net value of property for the benefit of disabled firemen, but not allowed (1904) to organize the same for police. A special amendment was adopted (177,615 for; 147,290 against) in November 1896, and came in effect on the 4th of December 1908, providing for a referendum applying to statutory law and to constitutional amendments, but emergency measures, and appropriations for the state government, for state institutions, and for public schools are exempt from referendum. Initiative petitions, signed by at least 8% of the legal voters in each of two-thirds (at least) of the congressional districts of the state, must be filed not later than four months before the election at which the measure is to be voted upon. The referendum may be ordered by the legislature or by a petition signed by at least 5% of the legal voters in each of two-thirds (at least) of the congressional districts of the state; such petition must be filed not more than 90 days after the final adjournment of the legislature; referred measures become law upon receiving a favourable majority of the popular vote. Among defeated amendments that are indicative of socio-political tendencies was one (1860) to authorize cities of a population of 30,000 or more to purchase, erect or maintain waterworks or lighting plants.

MISSOURI

The nullification system is nothing extraordinary in the general judicial system. The civil laws were adopted in 1836 and 1875, and as soon as American immigration began a limited application. The common law was introduced with the American settlers, and after 1804 was the explicitly declared basis of judicature. Practically no trace of French and Spanish administration was left except in the law of property. The metropolitan primacy of St Louis and Kansas City is reflected in the general organization of the courts. The Bureau of Labor Statistics maintains free employment-bureaus in St Louis, Kansas City and St Joseph, and a system of Mediation and Arbitration to settle labour disputes. A Board of Railroad and Warehouse Commissioners, elected by the people, was established in 1875, under a provision of the constitution requiring the general assembly to establish maximum rates and prohibit against discriminations.

The homestead of a housekeeper or head of a family, together with the rents and products of the same, is exempt from levy and attachment except to satisfy its liabilities at the time he acquired it. A homestead cannot be assessed, however, limited to 18 sq. rods of land and to $3000 in value if it is in a city having a population of 40,000 or more, or to 30 sq. rods and $1500 in value if in a city having a population of 10,000 and less than 40,000, to 5 acres and $3000 in value if in a county having a population of less than 10,000, and to 16 acres and $5000 in value if it is in the country. A husband owning a homestead is debarred from selling or mortgaging it without the joinder of his wife, and if the husband dies before the homestead is exempted from taxation, its exemption passes to either or to both jointly, and may be so held until the youngest child is twenty-one years of age or until the marriage or death of the widow. The principal grounds for divorce are impotence, bigamy, adultery, conviction of felony or other infamous crime subsequent to the marriage or before the marriage if it was known to the other party, desertion or habitual drunkenness for one year, such cruel or barbarous treatment as to endanger the life of the other, such conduct as to render the condition of the other intolerable, and vagrancy of the husband; but before applying for divorce the plaintiff must reside in the state for one year immediately preceding, unless the cause of action was given within the state or while the plaintiff was a resident of the state. A married woman may have a homestead of the same size as her husband. 2. She is entitled to the wages for her separate labour and that of her children, and is not liable for her husband’s debts. A widow has a dower right to one-third of her husband’s real estate. He is entitled to a homestead of 5 acres if he dies without leaving children or other descendants, the widow is entitled to all the real and personal estate which came to him by marriage, to what remains of the personal property which came to her by marriage, and one-half of his other real and personal estate at the time of his death. If a husband dies leaving descendants only by a former marriage, the widow may take in lieu of dower the personal property that came to him by means of marriage, or if there be children by both marriage, the husband may bequeath to the real and personal estate an absolute right therein equivalent to the share of a child. Her dower is not lost by a divorce resulting from the fault or misconduct of the husband. A widow is entitled to a share in his wife’s personal estate equal to the share of a child, and if there are

In 1907, in Missouri, as in various other states, passenger rates were increased by law to 2 cents per mile; but this law was declared unconstitutional in 1909.
no descendants he has an absolute right to one-half of her property, both real and personal.

Finance.—Revenue is drawn mainly from a general property tax. In 1904 the gross valuation of all taxable wealth was put at $1,400,000,000, or a valuation of $26.64 per head. In the years 1851-1857 a debt of $23,701,000 was incurred in aiding railways, and all the roads made during the Civil War. The state could not meet its guarantee obligations (being for loans of $35,000,000) on the expiration of the Constitution of 1875, and in 1866 had a bonded debt of $36,000,000. This was reduced to $21,675,000 by 1869, and in 1903 was wholly extinguished, every obligation having been fully discharged. A small debt (at the close of 1906, $4,398,839) is carried in the form of non-negotiable certificates. There are no trusts, and no farms purchased and taken from the educational funds of the state, and is intended as a permanent obligation to those funds. An amendment to the constitution adopted in 1908 permitted counties to make an extra levy of one-half of one per cent on the assessed valuation of property for the construction and repair of roads and bridges.

Charitable and Penal Institutions.—The charitable and penal institutions of the state include the penitentiary at Jefferson City, opened in 1836, which is self-supporting; a training school at Boonville (opened 1886), an industrial home for girls at Chillicothe (established 1887), hospitals for insane at Fulton (1847), St. Joseph (opened 1874), Nevada (1887), and Farmington (1899); a school for the blind at St. Louis (opened 1851); a school for the deaf and dumb at St. Louis (opened 1869); a school for the feeble-minded at Marshall (established 1899); a state sanitorium, for consumptives, at Mount Vernon (established 1905, opened 1907); a Federal soldiers' home at St. James, and a Confederate soldiers' home at Bellefontaine (opened 1896). The total number of pupils attending schools in 1908 was 48,223, and the percentage of the total enumeration enrolled was about 71; the general showing being excellent, and that for negroes remarkably so. Boys and girls are segregated in high schools scattered over the state, as is given over to the negroes; and in 1904 the number of pupils attending these schools was exceeded only by the corresponding numbers in Texas and Mississippi—states with five- and six-fold the negro population of Missouri. Illiteracy is practically unknown as an institution in the home of the state population, 28-1% of the negroes, 7-1% of the natives, 6-9% of the foreign-born. The idea of providing a university and free local schools as parts of a public school system occurs in the constitutions of 1821 and 1865, and in the Acts of Congress that pass down the way for statehood), and the occurrence is noteworthy; but the real beginnings of the system scarcely go back further than 1850. Nor was much progress made until a law was passed in 1853 requiring all the counties to erect and maintain general schools, and the revenue distributed among the county schools. This appropriation was made regularly after 1855 (save in 1861-1867), and since 1875 has rested on a constitutional provision. The maintenance of a free public school system was planned on a firm and broad foundation by the state constitution of 1875, and in 1887 one-third of the total revenue was appropriated to the public schools; and in 1908 the total appropriation for public schools, normal schools, and the state university was about three-fifths of the entire state revenue. Local taxation is another source of the school funds. In 1908 the total school fund, including state, county, township and special district funds, was about $14,000,000, of which the state fund was nearly one-third. The schools of St. Louis are a very important feature.

Among institutions of higher learning the university of Missouri at Columbia is the chief one maintained by the state. It was opened to students in 1831, received aid for the first time from the state in 1851, was chartered by the legislature in 1865, became a state institution in 1869, to the academic department in 1870, and soon afterwards to all departments. In addition to the academic department or college proper, the university embraces special schools of pedagogics (1868), agriculture and mechanic arts (1870), mines and metallurgy (1874), veterinary medicine (1875), fine arts (1875), engineering (1877), military science, commerce, a graduate school of arts and sciences (1896), and a department of journalism (1898). An experiment station supported by the national government was established in 1894. In 1898 the Missouri state Board of Agriculture organizes educational farmers' institutes; and agriculture is taught, moreover, in the normal schools of the state. Of these five are maintained as follows: at Kirkville (1870), at Warrensburg (established 1870), at Cape Girardeau (established 1873), at Springfield (established 1895), at Maryville (established 1905), and there is a normal department in connection with the Lincoln Institute, for negroes, at Jefferson City. Lincoln Institute (opened in 1866) is for negroes and women. The buildings of its endowment was a fund of $6379 contributed in 1866 by the 62nd and 65th regiments U.S. Colored Infantry upon their discharge from the service; it has agricultural, industrial, sub-normal, normal and college departments. The greatest is Washington University in St Louis; it is non-sectarian and was opened in 1857. Noteworthy, too, is the St Louis University, opened in 1829, the oldest institution for higher learning west of the Mississippi; it is a Jesuit college, and it has under its control a school of six other Jesuit institutions in the states of the middle west. There are many minor colleges and schools, most of them coeducational, and special colleges or academies for women are maintained. There are about 1000 dollars valuation for the construction and repair of roads and bridges.

Historic.—The early French explorers of the Mississippi valley left the first trace of European connexion in the history of Missouri. Ste Genevieve was settled in 1735; Fort Orleans, two-thirds of the way across the state up the Missouri river, had been temporarily established in 1720; the famous Mine La Motte, in Madison county, was opened about the same time; and before the end of the century there were French missions known to trappers and hunters for hundreds of miles above its mouth. It was in 1764 that St Louis (q.v.) was founded. Two years before, the portion of Louisiana west of the Mississippi had secretly passed to Spain, and in 1763 the portion east passed to England.

When the English took possession a large part of the people in the old French settlements removed west of the river. Not until 1770, after O'Reilly had established Spanish rule by force at New Orleans, did a Spanish officer at St Louis take actual possession of the upper country; another on the ground, in 1768-1769, had forborne to assert his powers in the face of the unfriendly attitude of the inhabitants. Spanish administration began in 1771. French remained the official language, and administration was so little altered that the people quickly grew reconciled to their changed allegiance. Settlement was confined to a fringe of villages along the Mississippi. French-Canadian hunters and trappers, and soon the river boatmen, added an element of adventure and colour in the primitive life of the colony. Lead and salt and peltries were sent to Montreal, New Orleans, and up the Ohio river to the Atlantic cities.

The Americans were hospitably received; the immigrants, even Protestant clergymen, enjoyed high privileges, and would complete religious toleration; and land by about 1752 other land grants to Americans were made by the authorities, who wished to strengthen the colony against anticipated attacks by the British, from Canada. Kentucky, Tennessee and Virginia furnished most of the new-comers. The French had lived in villages and maintained considerable communal life; the Americans scattered on homesteads. With them came land speculation, litigiousness, the development of mines and mining-camp law, and the passion of politics, of which duel was one feature of early days. In 1804 there were some 10,000 inhabitants in Upper Louisiana (mainly in Missouri), and of these three-fifths were Americans and their negroes. Racial antipathies were unimportant, and all parties were at least passively acquiescent when Louisiana became a part of the United States. On the 9th of March 1804, at St Louis, Upper Louisiana was formally transferred. In 1818, after passing meanwhile through four stages of limited self-government, that portion of the Purchase now included in the state of Missouri made application for admission to the Union as a state. In 1812-1813 a remarkable earthquake devastated the region about New Madrid. A large region was shaken, enormous fissures were opened in the earth, the surface soil was displaced

1 The constitutional provision requiring assessments at cash valuations is not at all observed; according to the State Revenue Commission of 1902 the average tax valuation was 40 to 50% of the insurance valuation. The national censuses of 1880 and 1890 (no estimate of the latter being made in 1900) put the total value of all property at $1,502,000,000 and $2,397,902,945 respectively.

2 In 1902 the bonded debts of counties and townships aggregated $6,066,668; that of towns and cities (mostly that of St Louis), $3,179,570.
and altered, and great lakes were formed along the Mississippi. One of these, Redfoot Lake, east of the river, is 20 m. long and 7 wide, and so deep that boats sail over the submerged tops of tall trees. Indian troubles again disturbed the peace during the second war with Great Britain. By 1808 the Indian title was extinguished to two-thirds of the state, though actual settlement did not extend more than a few miles westward from the Mississippi; in 1825, by a treaty with the Shawnee made at St Louis on the 7th of November, the title to the rest of the state was cleared, and a general removal of the Indians followed. Meanwhile, after the peace of 1815 a great immigration had set in, many settlers coming from the free states north of the Ohio. The application for statehood precipitated one of the most famous and significant episodes of national history—the Missouri Compromise (q.v.). In August 1821, after three years of bitter controversy, Missouri was formally admitted to statehood.

In the four decades before the Civil War, two matters stand out as most distinctive in the history of the state: the trouble with the Mormons, and the growth of river and prairie trade. In 1831–1832 Joseph Smith, the Mormon leader, selected a tract at the confluence of the Missouri and the Platte, who called the place Zion and resolved to solve the problem, to which his followers came from Ohio in 1832. They were not welcome. Their "revelations" in their papers predicted dire things for the Gentiles; they were trifling and well-to-do, and were rapidly widening their lands: they were accused of disregard for Gentile property titles, and they obstructed the processes of Gentile law within their lands. In 1833 the Missourians, in mass meeting, resolved to drive them from the country. The five years thereafter were marked by plunder and abuse of the sect. The militia and the courts gave them no protection. They were driven out, and went to Illinois, but continued to hold part of their abandoned lands. First St Louis, and then other towns on the Missouri river in succession westward, as they were settled and became available as dépôt, served as the outfit points for the Indian trade up the Missouri and the trade with Mexico through Santa Fé. The trail followed by the latter had its beginning about 1812, and (beginning in 1825) was surveyed by the national government. In early days Mexican and American military detachments escort the caravans on either side of the international line. Independence, Missouri (after about 1831) and Kansas City (after 1844) were the great centres of this trade, which by 1860 was of national importance.1 After the Civil War the railways gradually destroyed it, the Atchison Topeka & Santa Fé railroad running along the old wagon trail. No steamer traversed the Mississippi above the Ohio until 1817, nor was a voyage made between New Orleans and St Louis, nor the lower Missouri entered, until 1819. In 1832 a steamer ran to the mouth of the Yellowstone, and in 1890 the last commercial trip was made to old Fort Benton (Great Falls), Montana. The interval of years witnessed the growth of a river trade and its gradual decline as point after point on the river—Kansas City, St Joseph, Council Bluffs (Iowa), Sioux Falls (South Dakota) and Helena (Montana)—was reached and commanded by the railways. In 1906–1907 an active campaign was begun at Kansas City for improving the channel of the Missouri and elevating river freighting below that point.

Among events leading up to the Civil War, first the annexation of Texas and then the war with Mexico left special impress on Missouri history. Since 1828, when national political parties were first thoroughly organized in the state, the Democrats had been supreme, and carried Missouri on the pro-slavery side of every issue of free and slave territory. But there was always a strong body of anti-slavery sentiment,2 nevertheless; and this took organized form in 1849, when Senator Benton repudiated certain ultra pro-slavery instructions, breathing a secession spirit, passed by the General Assembly for the guidance of the representatives of the state in Congress. From that time until his death he organized and led the anti-disunion party of the state, Francis Preston Blair, jun., succeeding him as leader. The struggle over Kansas (q.v.) aroused tremendous passion in Missouri. Her border counties furnished the bogus citizens who invaded Kansas to carry the first territorial elections, and soon guerrilla forays back and forth gave over the border to a carnival of crime and plunder. Political conditions were chaotic. In the presidential election of 1860, Douglas received the electoral vote of the state, the only one he carried in the Union. The Republicans had little strength outside St Louis, where the German element was strong. A party led by Claiborne F. Jackson, the governor-elect, was resolved to carry the state out of the Union. Such secession, it was supposed, would carry the other border states out also. With equal blindness the Secessionists favoured, and the Republicans opposed, the calling of a special state convention to decide the issue of secession. The anti-secession party, which seemed to be the only well-organized, was perceived to be suicidally hostile to secession; and the convention, by a vote of 80 to 1, resolved (March 4, 1861) that Missouri had "no adequate cause" therefor. Governor Jackson thereupon sought to attain his ends by intrigue, and the national arsenal at St Louis became the objective of both parties. It was won by the unconditional-union men, but a smaller arsenal at Liberty was seized by the Secessionists. Governor Jackson refused point-blank to contribute the quota of troops from Missouri called for by President Lincoln. Aggressive conflict really opened at St Louis on the roth of May, and armed hostilities began in June. On the 10th of August 1861 at Wilson's Creek, near Springfield, General Nathaniel Lyon was defeated by a superior Confederate force in one of the bloodiest battles of the war. After this the Confederates held much of southern Missouri until the next spring, when they were driven into Arkansas, never afterward regaining foothold in the state. In the autumn of 1864 Sterling Price led a brilliant but rather bootless Confederate raid across the state, along the Missouri River, and was only forced to retreat southward by defeat at Westport (Kansas City). The western border was rendered desolate and deserted by guerrilla forays throughout the war. Probably 25,000 or 30,000 soldiers served in the Confederate armies, and 100,112 were furnished to the Union arms.3 This was a remarkable showing. There was more or less interne conflict throughout the war, and local disaffection under Union rule; and Confederate recruiting was carried on even north of the Missouri.

Altogether, the state offered a difficult civil and military problem throughout the Civil War. An emancipation proclamation issued by General J. C. Frémont at St Louis in August 1861, though promptly disavowed by President Lincoln, precipitated the issue. The state convention, after voting against secession, had adjourned, and after various sessions was dissolved in October 1863. Assuming revolutionary powers, it deposed Governor Jackson and other state officers, appointed their successors, declared vacant the seats of members of the Assembly, and abrogated the disloyal acts of that body. In October 1861 a rump of the deposed Assembly passed an act of secession, which the Confederate States saw fit to regard as legitimate, and under which they admitted Missouri to their union by declaration of the 28th of November. In 1862 the convention rejected the President's suggestion of gradual emancipation, disfranchised Secessionists, and prepared a strong oath of allegiance. In the summer of 1863 the convention decreed emancipation with compensation to owners. This did not satisfy the Radical Republicans, and on the issue of came of the plan, and the manner of its defeat proves that it could not possibly have been pushed to success. The trouble over Lovejoy's printing office at St Louis (1833–1836) put an effectual end to the movement for emancipation.

1 In 1855 its value was estimated at $5,000,000. In 1860 it was much greater. In the latter year the trade employed 3000 wagons, 62,000 oxen and mules, and 7000 men.

2 Under the constitution of 1820 the General Assembly had power to emancipate the slaves with the consent of their masters. In 1855 Senator T. H. Benton and others prepared a plan for educating the slaves and gradually emancipating them under state law; and undoubtedly a considerable party would have supported such a project, for the Whigs and Democrats were not then divided along party lines on the slavery issue; but nothing
**MISSOURI COMPROMISE**

immediate and unconditional emancipation they swept the state in November 1864. By the constitution of 1865 slavery was abolished outright. The convention of 1861, by maintaining continuous government, had saved the state from anarchy and from reconstruction by the national power; but an ironclad test oath (it required denial of forty-five distinct offences) was provided, to be taken by all voters, state, county and municipal officers, lawyers, jurors, teachers and clergymen. Its attempted enforcement was a grave error of judgment, and was attended by great abuses, and it was finally held unconstitutional by the United States Supreme Court. The legislature, however, maintained its ends by registration laws that reduced to impotence the Democratic electorate. The Radical Republicans held control until 1870, when they were defeated by a combination of Liberal Republicans and Democrats, and the test oath and the rest of the intolerant legislation of the war period were swept away. In 1872 the Democrats gained substantial control, and after 1876 their power was established beyond challenge. The constitution of 1875 closed the war period with blanket amnesties. Though in politics habitually Democratic, Missouri has generally had a strong opposition party. Whig in antebellum days, the war, Republicans, which in recent years has made political conditions increasingly unstable. This instability is shown in congressional and local rather than in general state elections. In 1908 a Republican governor was elected, the first for more than thirty years.

The Governors of Missouri since 1804 have been as follow—

**MISSOURI COMPROMISE,** an agreement (1820) between the pro-slavery and anti-slavery factions in the United States, involving primarily the regulation of slavery in the public territories. A bill to enable the people of Missouri to form a state government preliminary to admission into the Union came before the House of Representatives in Committee of the Whole, on the 13th of February 1819. An amendment offered by James Tallmadge (1778-1853) of New York, which provided that the further introduction of slaves into Missouri should be forbidden, and that all children of slave parents born in the state after its admission should be free at the age of twenty-five, was adopted by the committee and incorporated in the Bill as finally passed (Feb. 17) by the house. The Senate refused to concur in the amendment and the whole measure was lost. During the following session (1819-1820), the house passed a similar amendment, with an amendment introduced on the 26th of January 1820 by John Taylor (1784-1854) of New York making the admission of the state conditional upon its adoption of a constitution prohibiting slavery. In the meantime the question had been complicated by the admission in December of Alabama, a slave state (the number of slave and free states now becoming equal), and by the passage through the house (Jan. 3, 1820) of a bill to admit Maine, a free state. The Senate decided to connect the two measures, and passed a bill for the admission of Maine with an amendment enabling the people of Missouri to form a state constitution. Before the bill was returned to the house a second amendment was adopted on the motion of J. B. Thomas (1777-1850) of Illinois, excluding slavery from the "Louisiana Purchase" north of 36° 30' (the southern boundary of Missouri), except within the limits of the proposed state of Missouri. The House of Representatives refused to accept this and a conference committee was appointed. There was now a controversy between the two houses not only

---

1 Thus liberating about 114,000 blacks, of a tax valuation of $40,000,000.  
2 The Liberals were those who thought unjust the proscriptionary legislation passed against the Secessionists and Democrats; and to this issue of local politics were added the issues of national reform which the course of President Grant's administration had forced upon his party. A convention of Liberals that met at Jefferson City in January 1872 issued to all Republicans favorable terms within the party an invitation to meet at Cincinnati in May; and this was the convention of revolters against General Grant that nominated Horace Greeley of New York and B. Gratz Brown of Illinois as general candidates for the president and vice-presidency respectively. The first definite organization of the Liberal Republican party may therefore be said to have been made in Missouri in 1870.  
3 From 1803-1844 the elections were in August and inaugurations in November; Governor King served from the 27th of December 1848 till January 1853; thereafter the inauguration was in January, and beginning with 1864 the election was in November. The term was four years except under the constitution of 1865.
on the slavery issue, but also on the parliamentary question of the inclusion of Maine and Missouri within the same bill. The committee recommended the enactment of two laws, one for the admission of Maine, the other an enabling act for Missouri without any restrictions on slavery but including the Thomas amendment. This was agreed to by both houses, and the measures were passed, and were signed by President Monroe respectively on the 3rd and on the 6th of March 1820. When the question of the final admission of Missouri came up during the session of 1820-1821 the struggle was revived over a clause in the new constitution (1820) requiring the exclusion of free negroes and mulattoes from the state. Through the influence of Henry Clay an act of admission was finally passed, to come into operation as soon as the state legislature would pledge itself not to pass any legislation to enforce this clause. This is sometimes known as the second Missouri Compromise.

These disputes, involving as they did the question of the relative powers of Congress and the states, tended to turn the Democratic-Republicans, who were becoming nationalized, back again toward their old state sovereignty principles— to prepare the way for the Jacksonian-Democratic Party. On the other hand, the old Federalist nationalistic element was soon to emerge first as National Republicans, then as Whigs, and finally as Republicans. On the constitutional side the Compromise of 1820 was important as the first precedent for the congressional exclusion of slavery from public territory acquired since the adoption of the Constitution, and also as a clear recognition that Congress has no right to impose upon a state asking for admission into the Union conditions which do not apply to those states already in the Union. The compromise was specifically repealed by the Kansas-Nebraska Bill of 1854.

MISSOURI RIVER, the principal western tributary of the Mississippi river, U.S.A. It is formed at Gallatin City, in the Rocky Mountain region of south-western Montana, by the confluence of the Jefferson, Madison and Gallatin forks; thence it flows N. into the plains, which it traverses in a course at first gradually to the S.E., then S., and again S.E., traversing both North and South Dakota. It forms the eastern boundary of Nebraska and in part of Kansas, and crosses Missouri in an easterly course to its junction with the Mississippi 20 m. above St Louis, and 2,547 m. below the confluence of the three forks. The river, which is known as the Jolens Fork in its lower course, Beaver Head River in its middle course, and Red Rock Creek in its upper course, is really the upper section of the Missouri; it rises on the border between Montana and Idaho, 20 m. west of the western boundary of the Yellowstone National Park, near the crest of the Rocky Mountains, 8,000 ft. above the sea, and 366 m. beyond Gallatin City; and with this and the Lower Missouri the Missouri forms a river channel 4,221 m. in length, the longest in the world. The Madison and Gallatin forks rise within the Yellowstone Park, where the former is fed by geysers and hot springs and the latter by both hot springs and melting snow. The Yellowstone river, which is the principal tributary of the Missouri, traverses the park. The Missouri drains a basin having an area of about 560,000 sq.m.; this includes the eastern slope of the Rocky Mountains from the northern border of the United States to the middle of Colorado, and from the Missouri to the Missouri in those mountains. Besides the Yellowstone and the three forks there are the Platte, which rises in two large branches in Colorado, and the Milk, which rises in north-western Montana. The Kansas in Kansas, the James and Big Sioux in the Dakotas, and the Niobrara in Nebraska, are the principal tributaries wholly of the plains. In the mountain region the Missouri flows through deep canyons and over several cascades. Below Great Falls the slower current is unable to carry all the silt brought down from the mountains and plains, and consequently a winding and unstable channel has been formed on deposits of silt 50 to 200 ft. or more in depth. Bends in the river continue to develop by erosion until the neck between two of them is cut off, and in the process numerous islands, sand-bars, and crescent-shaped lakes are formed. Cottonwood, willow, cedar and walnut trees grow upon the banks that are for a time left undisturbed, but years later the eroding current returns to undermine these banks, the trees fall in and are carried down stream as snags (or "sawyers"), which are especially dangerous to navigation. The variation of level is great and it varies greatly in different parts of the river's course: it is about 15 ft. at Kansas City, about 25 ft. at St Charles, Missouri, and about 8 ft. at Fort Benton, Montana. It is estimated that the Missouri's average discharge per second amounts to about 94,000 cubic ft., and that each year it carries into the Mississippi 550,000 tons of silt. The waters of the Missouri begin to rise in March, and a high-water stage is reached in April as a result of the spring rains and the melting snow on the plains; a second high stage is produced in June by the melting of snow on the mountains, and the river is navigable from early spring to midsummer as far as Fort Benton, within 40 m. of the Great Falls and 2,825 m. above the mouth. Above Great Falls the river is navigable to Three Forks.

The mouth of the Missouri was discovered in 1673 by Marquette and Joliet, while they were coming down the Mississippi. Early in the 18th century French fur-traders began to ascend the river, and in 1764 St Louis was established as a depot; but the first exploration of the river from its mouth to its headwaters was made in 1804-1805 by Meriwether Lewis and William Clark. Until many years later the commerce on the river was restricted to the fur trade and was carried on with such primitive craft as the canoe (made from the log of a cottonwood tree); the pirogue (usually two canoes side by side and with a floor over them on which to place the cargo); the bullboat (made by covering a framework of willow poles with the hides of bison bulls); the mockinaw boat (made of boards and having a flat bottom); and the keelboat (a vessel of some pretensions, with a keel from bow to stern, 60 to 70 ft. in length, with a breadth of beam from 15 to 18 ft., and drawing 20 to 30 in. of water). A canoe, pirogue, bullboat, or mockinaw boat was propelled by two or more men with paddles, poles, or oars; but to propel a keelboat up the river required 20 to 40 men who walked along the shore and pulled a corvée, a line about 1,000 ft. long and fastened to the mast. An average of about 15 m. a day was made with a keelboat going up the river. The first attempt to navigate the Missouri with steamboats was made in the spring of 1819, when the "Independence" made a trip from St Louis to the mouth of the Chariton river and back. The American Fur Company began to use steamers in 1830, and from then until the advent of railways the steamboat on the Missouri was one of the most important factors in the development of the Northwest. The traffic was at its height in 1858, when no fewer than 60 regular packets were engaged in it, but its decline began in the following year with the completion of the Hannibal & St Joseph railway to St Joseph, Missouri, and 20 years later it had nearly disappeared. In an attempt to regulate railway rates, however, four boats were run between Kansas City and St Louis between 1890 and 1894 by the Kansas City & Missouri Transportation Company, and in 1906 the Missouri River Valley Improvement Association was formed at Kansas City. Congress began to make appropriation for the removal of snags about 1858, and forty years later appropriations were made for a general improvement which in 1888 was placed under the charge of the Missouri River Commission. In 1890 its work was restricted to that part of the river below Sioux City and in 1902 the Commission was abolished. Up to the 30th of June 1908 the Federal government had expended $1,398,881 for the improvement of the river.

See H. M. Chittenden, History of Early Navigation on the Missouri River (New York, 1903); E. E. Chappell, A History of the Missouri River (Kansas City, 1903); J. V. Brower, The Missouri River and
MISTAKE—(i.e. take amiss), a misconception or error in thought or action. In law, the word is often used in the sense of ignorance or error, as when it is said that mistake of law affords no excuse for crime. In the law of contract, mistake is of special importance, and may occur either in a matter of law or in a matter of fact. In general, a mistake of law cannot be avoided in allegation of the consequences of contracts or acts, although there are exceptions in which relief may be given. Mistake of fact, however, may be ground for avoidance, provided the mistake was not due to negligence. (See further Contract.)

MISTLETOE 1 (Viscum album), a species of Viscum, of the botanical family Loranthaceae. The whole genus is parasitical, and contains about twenty species, widely distributed in the warmer parts of the old world; but only the mistletoe proper is a native of Europe. It forms an evergreen bush, about 4 ft. in length, thickly crowded with forked branches and opposite leaves, which are about 2 in. long, obovate-lanceolate in shape and yellowish-green; the dioecious flowers, which are small and nearly of the same colour but yellower, appear in March; the white berries when ripe are filled with a viscous semi-transparent pulp (whence birtle-line is derived). The mistletoe is parasitical both on deciduous and evergreen trees and shrubs.

In England it is most abundant on the apple-tree, but barely found on the oak:—Poppars, willows, lime, mountain-ash, maples, are favourite habitats, and it is also found on many other trees, including cedar of Lebanon and larch. The fruit is eaten by most frugivorous birds, and through their agency, particularly that of the species which is accordingly known as mistle-thrush or mistle-thistle, the plant is propagated. The Latin proverb has it that “Turdis malum sibi cactus”: but the sowing is really effected by the bird wiping its beak, to which the seeds adhere, against the bark of the tree on which it has alighted. The viscid pulp soon hardens, affording a protection to the seed; in germination the sucker-root penetrates the bark, and a connection is established with the vascular tissue of the first plant. The growth of the plant is slow, and its durability proportionately great, its death being determined generally by that of the tree on which it has established itself. Mistletoe is extensively used. The mistletoe is largely derived from the apple orchards of Normandy; a quantity is also sent from the apple orchards of Herefordshire.

Pliny (H. N. xvi. 92-93; xxiv. 6) has a good deal to tell about the viscum, a deadly parasite, though slower in its action thanivy. He distinguishes three genera: “On the fir and larch grows what is called stells in Euboea and kyphear in Arcadia. Viscum, called kyphear byper, is most plentiful on the esculent oak, but occurs also on the robor, Prunus sylvestris and terebinth. Hyphem is useful for fattening cattle if they are hardy enough to withstand the purgative effect it produces at first; viscum is medicinally of value in indigestion, and in cases of tumour, ulcers and the like. Pliny is also our authority for the reverence in which the mistletoe was held in the Druids. Prepared as a draught, it was used as a cure for sterility and a remedy for poisoning. It is also mentioned as being the mistletoe whichucus leaf has been used in Europe. Having furnished the material of the arrow with which Baldric (the sun-god) was slain by the blind god Höder. Most probably this story has its origin in a particular tale as to the meaning of the word mistletoe.

MISTRAL, FRÉDÉRIC (1830— ), Provençal poet, was born at Maillane (Bouches-du-Rhône) on the 8th of September 1830. In the autobiographical sketch prefixed to the Islo d'or (1876) he tells us, with great simplicity and charm, all that is worth knowing of his early life. His father was a prosperous farmer,

1 Gr. τεισθ, tēstēs, hence Lat. viscum, Ital. vischio or visco, and Fr. gui. The English word is the O.F. mistel, Icelandic mistel- 

101, in which tan or tei mean a twig, and mistel may be associated either with mist in the sense of fog; mist, because of the prominence of mistletoe in the dark season of the year, or with the same root in the sense of dung (from the character of the berries or the supposed mode of propagation). and his mother a simple and religious woman of the people, who first taught him to love all the songs and legends of the country. In these early days on the farm he received those first impressions which were destined to constitute one of the chief beauties of Mirrò. In his ninth year Mistrail was sent to a small school at Avignon, where he was very wretched at first, regretting the free outdoor life of the country. Gradually, however, his studies attracted him, above all the poetry of Homer and Virgil; and he translated the latter's first eclogue, showing his efforts to a young schoolfellow, A. Mathieu, who was destined to play a part in the foundation of the Félibrige. When Roumianille (see PROVENÇAL LITERATURE) became an usher at Mistrail's school, the two, fired by the same love of poetry and of their native Province, soon became close friends. "Voilà l'âme que mon âme attendait pour s'éveiller à la lumière," he exclaimed, on reading Roumianaillle's first dialect poems; and he goes on to say: "Embrasés tous deux du désir de relier le parler de nos mères, nous étudions ensemble les vieux livres Provençaux, et nous nous proposions de restaurer la langue selon ses traditions et caractères nationaux." On leaving school (1847) he returned to Maillane, where he spent a pastoral term in four cantos (Les Mères de Provence). With all his love for the country, he soon realized that life on a farm did not satisfy his ambition. So he went to study law at Aix, where he contributed his first published poems to Roumianille's Li Provencanu (1852). He had become licencié en droit the year before, but now decided on a literary career. The Félibrige was founded in 1854, and five years later appeared Mirrò, the masterpiece not only of Mistrail, but so far of the entire school. The tale itself was nothing—the old story of a rich girl and her poor lover, kept apart by the girl's parents. Mireille, in despair, wanders along a wide tract of country to the church of the Trois-Maries, in the hope that these may aid her. But the effort was too great: she sinks exhausted, and dies in the presence of her stricken parents and her frenzied lover. Into this simple web Mistrail has woven descriptions of Provençal life, scenery, character, customs and legends that raise the poem to the dignity of a rustic epic, unique in literature. Nothing is forced: every detail is filled into the framework of the whole with a cunningly wrought interweave. The poet was never again to attain. There is no deep psychology in the characters, but then the people depicted are simple rustic folk, who wear their hearts on their sleeve. Calendau (1867), the story of a princess held in bondage by a ruthless brigand, and eventually rescued by a youthful hero, is a comparative failure. The description of scenery is again masterly; but the old lore, which had charmed all readers in Mirrò, here becomes forced, not inevitable. The characters are mere symbols—indeed the whole poem is obviously an allegory, the princess standing for Provence, the brigand for France, and the young lover for the Félibrige. Mistrail lavished enormous labour on this work, which probably accounts for its lack of spontaneity, as also for the love he bears it. In 1866 (the same year in which he married Mlle Marie Rivière, of Dijon) was published the volume L'Isle d'or—a collection of the shorter poems Mistrail had composed from the year 1848 onwards. Here he is again at his very best. Old legends, servantes (mostly, as in medieval times, poems with a tendency, and lyrics—all are admirable. Even the pêches d'occasion may be acknowledged with the best of their kind. Two pieces, the Coupe and the Princesse, aroused violent controversy on their first appearance. They reproduce, in effect, the theme of Calendau, and Mistrail was accused of trying to sow discord between the north and south of France. Needless to say he was altogether innocent of such a design. Nero (1848) is a charming tale of Avignon in the olden days, in which a girl's purity triumphs over her lover's base designs and leads him to nobler thoughts. There is little individuality in the characters, which should rather be regarded as types; and we feel no terror or pity at the tragic close. But we are carried along by Mistrail's art by and by the brilliancy of his epistles; and he achieved the object he had in view: a pretty tale imbued with the proper touch of local colour and with the true spirit of romance. The play La Rêno Jono (1890) is a complete failure, if judged from the dramatic
MISTRAL—MITCHELL, M.

617

pointed: it is neither a brilliant panorama, a series of stage pictures, and the characters either live or occur by our own consent. In the great epopee on the Rhone (Lou Penseur du Rhone, 1897) M. MISTRAL depicts the former barge-life of that river, and intertines his narrative with the legends clustering round its banks, and with a graceful love episode. For the first time he employs blank verse, and uses it with great mastery, but again the ancient lore is overdone. A splendid piece of work is Lou Tresor du Félibrige (1886). In these two volumes MISTRAL has deposited with loving care every word and phrase, every proverb, every scrap of legend, that he had gathered during his many years' journeyings in the south of France. In 1894 he was awarded one of the Nobel prizes for literature.

An excellent literary appreciation of the poet is that by Gaston Paris, in his Origines du MISTRAL (originally in the Revue de Paris (Oct., and Nov. 1894); then in Penseurs et Poètes (Paris, 1896). More elaborate accounts are Welter, Frédéric MISTRAL (Marburg, 1890); and Downer, Frédéric MISTRAL (New York, 1901), with a full bibliography.

MISTRAL, a local wind similar to the bora (q.v.), met with on the French Mediterranean coast. The warm Gulf of the Lion (Golfe de Lion) has to the north the cold central plateau of France, which during winter is commonly a centre of high barometric pressure, and the resulting pressure gradient causes persistent currents of cold dry air from the north-west in the intermediate zone. The mistral occurs along the coast from the mouth of the Ebro to the Gulf of Genoa, but attains greatest strength and frequency in Provence and Languedoc, i.e. the district of the Rhone delta, where it blows on an average one day out of two; the record at Marseilles is 175 days in the year. It is usually associated with cloudless skies and brilliant sunshine, intense dryness and piercing cold. With the passage of a cyclone over the Gulf, or a rapid rise of pressure following a fall of snow on the central plateau, the mistral develops into a stormy wind of great violence.

MISTRESS (adapted from O. Fr. maistresse, mod. madame, the feminine of maître, maître, master), a woman who has authority, particularly over a household. As a form of address the term of courtesy the word is used in the same sense as "madam." It was formerly used indifferently of married or unmarried women, but now, written in the abbreviated form Mrs. (pronounced "miss"), it is practically confined to married women and prefixed to the surname; it is frequently retained, however, in the case of spinster cooks or housekeepers, as a title of dignity; as the female equivalent of "master" the word is used in other senses by analogy, e.g. of Rome as "the mistress of the world," Venice "the mistress of the Adriatic," &c. From the common use of "master" as a teacher, "mistress" is similarly used. The old usage of the word for a lady-love or sweetheart has degenerated into that of paramour. "Miss" a shortened form of "mistress," is the term of address for a girl or unmarried woman; it is prefixed to the surname in the case of the eldest or only daughter of a family, and to the Christian names in the case of the younger daughters.

MITAU (Russian, Miluta; Lettish, Vēlga), a town of Russia, capital of thegovernment of the same name, 39 m. by rail S.W. of Riga, on the right bank of the river As, in a fertile plain which rises only 12 ft. above sea level, and has probably given its name to the town (mitte in the Aue). Pop. (1897), 35,011 inhabitants, mainly Germans, but including also Jews (6,900), Letts (5,000) and Russians. At high water the plain and sometimes also the town are inundated. Mitau is surrounded by a canal occupying the site of former fortifications. It has regular, broad streets, bordered with the mansions of the German nobility, who reside at the capital of Courland. Mitau is well provided with educational institutions, and is also the seat of the Lettish Literary Society. The old castle (1266) of the dukes of Courland, situated on an island in the river, was destroyed by Duke Biren, who erected in its place (1738-1772) a spacious palace, now occupied by the governor and the courts. Manufactures are few, those of wax-cloth, linen, soap, ink and beer being the most important. Mitau is supposed to have been founded in 1266 by Conrad Mandern, grand-master of the order of the brethren of the Sword. In 1354, when it was plundered by the Lithuanians, it was already an important town. In 1561 it became the residence of the dukes of Courland. During the 17th century it was thrice taken by the Swedes. Russia annexed it with Courland in 1705. It was the residence (1708-1801 and 1804-1807) of the count of Provence (afterwards Louis XVIII). In 1812 it was taken by Napoleon I.

MITCHAM, a suburb of London, in the Wimbledon parliamentary division of Surrey, England, ro m. S. of London Bridge by the London, Brighton & South Coast railway. Pop. (1901), 14,903. Mitcham Common covers an area of 480 acres, and affords one of the best golf courses near London. The neighbourhood abounds in market gardens and plantations of aromatic herbs for the manufacture of scents and essences.

MITCHELL, ORMSBY MACKNIGHT (1809-1862), American astronomer, was born at Morganfield, Kentucky, on the 28th of July, 1809. He began life as a clerk, but, obtaining an appointment as a volunteer at Fort Point in 1825, he graduated in 1829, and acted as assistant professor of mathematics 1829-1832. He was then called to the bar, but in 1836 became professor of mathematics and natural philosophy at Cincinnati College. In 1845 he was made director of an observatory established there through his initiative, and also in 1859 superintendent of the Dudley observatory at Albany. In 1861 he took part in the war as brigadier-general of volunteers, and for his skill in seizing certain important strategic points was on the 11th of April 1862 made major-general. He died of yellow fever at Beaufort, South Carolina, on the 30th of October 1862. He founded the Sidereal Messenger in 1846, was one of the first to adopt (in 1848) the electrical method of recording observations, and published besides other works, The Orbs of Heaven (1848, &c.), and Popular Astronomy (1862), both reissued at London in 1892.

MITCHELL, DONALD GRANT (1822-1908) American author, was born in Norwich, Connecticut, on the 12th of April 1822. He graduated at Yale College in 1841; studied law, but soon took up literature. Throughout his life he showed a particular interest in agriculture and landscape-gardening, which he followed at first in pursuit of health. He produced books of travel, volumes of essays on rural themes, of which My Farm of Edgewood (1863) is the best; sketchy studies of English monarchs and of English and American literature; and a character-novel entitled Doctor Johns (1860), &c.; but is best known as the author (under the pseudonym of "Jk Marvel"), of the sentimental essays contained in the volumes Recollections of a Bachelor, or a Book of the Heart (1850), and Dream Life, a Fable of the Seasons (1851).

MITCHELL, MARIA (1818-1885), American astronomer, was born of Quaker ancestry on the island of Nantucket on the 1st of April, 1818. In 1840 the Rev. S. W. Due, her father, a school teacher and self-taught astronomer, who rated chronometers for Nantucket whalers, was an overseer of Harvard University (1857-1865), and for a time was employed by the United States Coast Survey. As early as 1851 (during the annular eclipse of the sun) she had been her father's assistant in his observations. On the 1st of October 1847 she discovered a telescopic comet (seen by De Vico Oct. 3, by W. R. Dawes Oct. 7, by Madame Rümker Oct. 11), and for this discovery she received a gold medal from the King of Denmark, and was elected (1848) to the American Academy of Arts and Sciences, and (1850) to the American Association for the Advancement of Science. In 1861 she removed from Nantucket to Lynn, where she used a large equatorial telescope presented to her by the women of America; and there she lived until 1867, when she became professor of astronomy and director of the observatory at Vassar College; in 1888 she became professor emeritus. In 1874 she began making photographs of the sun, and for years she made a special study of Jupiter and Saturn. She died at
MITCHELL, S. W.—MITE

Lynn on the 28th of June 1889. In 1908 an observatory was established in her honour at Nantucket.

See Phoebe Mitchell Kendall, *Maria Mitchell: Life, Letters and Journals* (Boston, 1908); *In Memoriam* (1888), her pupil and successor at Vassar, Mary W. Whitney; and a sketch by her brother, Henry Mitchell (1830–1902), himself a well-known hydrographer, in the *Proceedings of the American Academy of Arts and Sciences*, vol. xxv. (1889–1890), pp. 331–343.

MITCHELL, SILAS WEIR (1839–1923), American physician and author, son of a Philadelphia doctor, John Kearseley Mitchell (1798–1858), was born in Philadelphia on the 15th of February 1830. He studied at the University of Pennsylvania in that city, and received the degree of M.D. at Jefferson Medical College in 1850. During the Civil War he was surgeon to a number of hospitals in the North, and upon the close of the war became a specialist in nervous diseases. In this field Weir Mitchell’s name became prominently associated with his introduction of the “rest cure,” subsequently taken up by the medical world, for nervous diseases, particularly hysteria; the treatment consisting primarily in isolation, confinement to bed, dieting and massage. In 1863 he wrote a clever short story, combining physiological and psychological problems, entitled “The Case of George Dedlow,” in the *Atlantic Monthly*. Thenceforward Dr Weir Mitchell, as a writer, divided his attention between professional and literary pursuits. In the former field he produced monographs on rattlesnake poison, on intellectual hygiene, on injuries to the nerves, on neurasthenia, on nervous diseases of women, on the effects of gunshot wounds upon the nervous system, and on the relations between nurse, physician, and patient; while in the latter he wrote juvenile stories, several volumes of respectable verse, and prose fiction of varying merit, which, however, gave him a leading place among the American authors of the close of the 19th century. His historical novels, *Hugh Wynne Free Quaker* (1897), *The Adventures of Francois* (1898) and *The Red City* (1900), take high rank in this branch of fiction.

MITCHELL, SIR THOMAS LIVINGSTONE (1792–1855), Australian explorer, was born at Craighend, Stirlingshire, Scotland, on the 16th of June 1792. From 1808 to the end of the Peninsular War he served in Wellington’s army, and was raised to the rank of major. He was appointed to survey the battlefields of the Peninsula, and his map of the Lower Pyrenees is still admired. In 1827 he was appointed deputy surveyor-general, and afterwards surveyor-general of New South Wales. He made four exploring expeditions between 1831 and 1846, and discovered the Peel, the Namoi, the Gwyder and other rivers, traced the course of the Darling and Glenelg, and was the first to penetrate into that portion of the country which he named Australia Felix. His last expedition was mainly devoted to the discovery of a route between Sydney and the Gulf of Carpentaria, and during the journey he explored the Fitzroy Downs, and discovered the Bucanan, Victoria, Warrego and other streams. In 1838, while in England, Mitchell published his *Three Expeditions into the Interior of East Australia*. In 1839 he was knighted and made a D.C.L. of Oxford. During this visit he took with him some of the first specimens of gold and the first diamond found in Australia. In 1848 the narrative of his second expedition was published in London, *Journal of an Expedition into the Interior of Tropical Australia*. In 1851 he was sent to report on the Bathurst goldfields, and in 1853 he again visited England and patented his boomerang propeller for steamers. He died at Darling Point, Sydney, on the 5th of October 1855.

Besides the above works, Mitchell wrote a book on *Geographical and Military Surveying* (1827), an *Australian Geography*, and a translation of *C. F. Weidmann’s Dictionary* (1827). In 1843, when he was surveyor-general he published an admirable map (still in use) of the settled districts of New South Wales.

MITCHELL, a city and the county-seat of Davison county, South Dakota, U.S.A., about 70 m. W.N.W. of Sioux Falls. Pop. (1905), 5719; (1910), 6315. Mitchell is served by the Chicago, Milwaukee & St Paul and the Chicago, St Paul, Minneapolis & Omaha railways. Among its buildings and institutions are the city hall, the Federal building, a Carnegie library, a hospital, and a sanatorium. Mitchell is the seat of the Dakota Wesleyan University (1885; Methodist Episcopal). At Mitchell is a “corn palace,” which is decorated each autumn with split ears of Indian corn, and is the centre of an annual festival, held in September and October. The city is an important shipping point for grain and livestock, and has a large wholesale drygoods stock. There are railway repair shops of the Chicago, Milwaukee & St Paul railway, machine shops, and manufactories of bricks and dressed lumber. Mitchell was settled in 1879 and charted as a city in 1883.

MITCHELSTOWN, a market town of Co. Cork, Ireland, situated between the Kilkowth and Gyatt Mountains, on a branch of the Great Southern & Western railway. Pop. (1901), 2146. Here is the Protestant Kingston College, a home for poor gentlefolk, founded by James, Lord Kingston, in 1760. The seat of the earls of Kingston was built in 1823. It is a massive castellated structure, among the finest of its kind in Ireland. The Mitchelstown limestone caves, exhibiting beautiful stalactite formations, are 6 m. distant in Co. Tipperary (q.v.). On the 9th of September 1887 Mitchelstown was the scene of a riot in connexion with the Irish Nationalist “plan of campaign.” Two police constables were killed, three more wounded, and two men were killed, after which the coroner’s jury brought in a verdict of wilful murder against the police. This verdict was ignored by the government, and subsequently quashed by the Queen’s Bench in Dublin, but additional feeling was aroused in respect of the incident owing to a message later sent by Mr Gladstone ending with the words “Remember Mitchelstown.”

MITE, a name applied to an order of small Arachnida, with which this article deals, and to a coin of very slight value. The origin of both would appear to be ultimately the same, viz., a root *mei-*, meaning something exceedingly small. It has been suggested that the name for the animal comes from a secondary root of the root *mei-*, to cut, whence come such words as Goth. *motelan*, to cut, and Ger. *messer*, knife. In this case mite would mean “the biter” or “cutter.” The coin was originally a Flemish copper coin (Dutch *mijl*) worth one-third or, according to some authorities, a smaller fraction of the Flemish *penning*, penny. It has become a common expression for a coin of the smallest value, from its use to translate Gr. *mesoiv*, two of which made a *kolpaeis*, translated “farting” (Mark xii. 43).

In zoology, “mite” is the common name for minute members of the class Arachnida (q.v.), which, with the ticks, constitute the order Acari. The word “mite,” however, is merely a popular and convenient term for certain groups of Acari, and does not connote a natural assemblage as contrasted with the ticks (q.v.). Mites are either free-living or parasitic throughout their lives or parasitic at certain periods and free-living at others. They are almost universally distributed, and are found wherever terrestrial vegetation, even of the lowest kind, occurs. They are spread from the arctic to the antarctic hemisphere, and inhabit alike the land, fresh-water streams and ponds, brackish marshes and the sea. The largest species, which occur in the tropics, reach barely half an inch in length; while the smallest, the most diminutive of the Arthropoda, are invisible to the naked eye. *In Mites*. Mites are divided into a considerable number of families. The Bdellidae (Bdello) are (free-living forms with long antenniform palp). The large tropical forms above mentioned belong to the genus *Trombiculidium* of the family Trombidiidae. The members of this genus are covered with velvety plush-like hairs, often of an exquisite crimson colour. The legs are adapted for crawling or running, and the palpi are raptorial. They are non-parasitic in the adult stage; but immature individuals of a British species (T. holosericum) are parasitic upon various animals (see Harvest Bug). The Tetranychidae are nearly related to the last. A well-known example, *Tetranychus telarius*, spins webs on the backs of leaves, and is sometimes called the money spider. The fresh-water mites or Hydrachnidae are generally beautifully coloured red or green, and are commonly globular in shape. Their legs are furnished with...
long hairs for swimming. The marine mites of the family Halacaridae, on the contrary, are not active swimmers but merely crawl on the stems of seaweeds and zoophytes. The Gamasidae are mostly free-living forms with a thick exoskeleton, and are allied to the Ixodidae or ticks (q.v.). A common species is Gamasus coleoptratorum, the females and young of which may be found upon the common dung-beetle. The Oribatidae or beetle-mites, so called from their resemblance to minute beetles, are non-parasitic, and often go through remarkable metamorphoses during development. The Sarcoptidae, as stated below, are mostly parasitic forms. Some members of this family, however, live in decaying animal substances, the best known perhaps being the cheese-mite (Tycholyphus siri) which infests cheese, especially Stilton, in thousands. An allied species (T. entomophagus) often causes great damage to collections of insects by destroying the dried specimens. They may be easily exterminated by application of benzine, which does not harm the contents of the cabinet.

From the economic standpoint the most important mites are those which are parasitic upon mammals and birds. They belong to the four families, Gamasidae, Trombiidiidae, Sarcoptidae and Demodicidae. Most of the Gamasidae are free-living mites. The family, however, contains an aberrant genus, Gamasus, in which real species have been described, although they are all perhaps merely varieties of one and the same species commonly known as D. gallinae or D. avium. This species is found in fowl-houses, dovecotes and bird-cages. During the day they lurk in cracks in the floor, walls or perches, and emerge at night to attack the roosting birds. They are a great pest, and frequently do much damage to birds both by sucking their blood and by depriving them of rest at night. They are sometimes transferred from birds to mammals. The Trombiididae also are mostly free-living predaceous mites. A few, however, are parasitic upon mammals and birds, the best-known being Trombidium holosericum, the larva of which attacks human beings, as well as chickens and other birds, sometimes producing considerable mortality amongst them (see Harvest Bug). Another genus, Cheyletiella, affects rabbits as well as birds. Birds are also attacked by many species of Sarcoptidae, which according to the organs infected are termed plumicolous (Analogesina), epiceromicolous (Epidermoptinae), and cystic (Cytoditinae). The Analoginae (Pterolichus, Analges) live almost wholly upon and beneath the skin, their mantles being more or less typical of every species of bird without apparently affecting the health in any way. The Epidermoptinae (Epidermoptes) occur on diseased fowls and live, as their name indicates, upon the skin at the base of the feathers, where their presence gives rise to an accumulation of yellowish scales. The Cytoditinae (Cytodites), on the other hand, live in the subcutaneous or intermuscular connective tissue round the respiratory organs, or in the air sacs, especially of gallinaceous species. They also penetrate certain internal organs, and may become encysted and give rise to tuberculosis-like nodules. Sometimes they exist in such quantities in the air passages as to cause coughing and asphyxia.

The cutaneous mites, mentioned above, and others akin to them, produce no very marked disturbance in the skin of the species they infest. They merely suck the blood or feed upon the feathers, scurf and desquamating epidermis. Hence they are termed "non-psoritic" mites. A certain number of species, however, called in contradistinction "psoritic" mites, give rise by their bites, by the rapidity of their multiplication, and by the excitation of galleries in the skin, to a highly contagious disease which is more or less serious, which, if not checked in time produces the gravest results. These mites belong exclusively to the Sarcoptidae and Demodicidae. A variety of species are responsible for Sarcoptic mange, Sarcoptes mutans producing it in the feet of gallinaceous and passerine birds by burrowing beneath the scales and giving rise to a crustated exudation which pushes up beneath and between the scales. Feather scabies or depilating scabies of poultry is caused by another species, S. laevis. Three genera of Sarcoptidae, namely Sarcoptes, Cheyletiella and Psoropticus cause mange or scabies in mammals, the mange produced by Sarcoptes being the most serious form of the disease, because the females of the species which produces it, Sarcoptes scabiei, burrow beneath the skin and are more difficult to reach with acaricides. A considerable number of varieties of this species have been named after the hosts upon which they most commonly and typically occur, such as S. scabiei hominis, equi, bovis, caprae, ovis, camel, lupi, vulpis, &c.; but they are not restricted to the mammals from which their names have been derived and structural differences between them are often difficult to define and sometimes non-existent. Under favourable conditions the multiplication of this species is very rapid. It has been computed indeed that a single pair may give rise to one million and a half individuals in about three months. Psoropticus lives in the epidermic incrustations to which it gives rise, without, however, excavating subcutaneous burrows. One species, P. communis, is known to affect various domestic animals. Of the genus Cheyletiella two species have been described on domestic animals, viz. Ch. symbiotecus, which has the same mode of life as Psoropticus communis and Ch. cymotis, which has been detected only in the ears of certain carnivora such as dogs, cats and ferrets. Mange, if taken in time, can be cured by applications of sulphur ointment or of sulphur mixed with an animal or vegetable oil. The family Demodicidae give rise to a skin disease called "Demodeca," which, although often serious and always difficult to cure, amounts to no more than a small percentage of the deep situation taken up by the parasites. These infest the hair follicles and sebaceous glands, and are therefore termed Demodeca follicularum. These mites differ greatly from those previously noticed—in the reduction of their legs to short three-jointed tubercles, and in the great elongation of the abdomen to form an annulated flexible postanal area to the body. They live not uncommonly in small numbers in the skin of the human face and their presence may never be detected. They also occur on dogs, pigs and other domesticated animals, as well as on mice and bats, and numerous varieties named after their hosts, hominis, bovis, ovis, cat, &c., have been described, but they apparently differ from each other, principally in size.

The mites of the family Eriophyidae or Phytopytidae produce in various plants pathological results analogous to those produced in animals by parasitical Sarcoptidae and by Demodicidae. As in the Demodicidae the abdomen is elongate and annulate, but the Eriophyidae differ from all other mites in having perpendicularly the four or six pairs of legs. The exoskeleton and patches may produce on leaves are called "galls," which are known of which are perhaps the nail-galls of the lime caused by Eriophyes litlea. A very large number of species have been described and named after the plants upon which they live. They often inflict very considerable loss upon fruit-growers by destroying the growing buds of the trees.

MITFORD, MARY RUSSELL (1787–1855), English novelist and dramatist, only daughter of Dr George Mitford, or Midford, was born at Alresford, Hampshire, on the 16th of December 1787. She retains an honourable place in English literature as the authoress of Our Village, a series of sketches of village scenes and characters unsurpassed in their kind, and as fresh as if they had been written yesterday. Her father was a curious character. He first spent his wife's fortune in a few years; then he spent the greater part of £20,000, which in 1797 his daughter, then at the age of ten, drew as a prize in a lottery; then he lived on a small remnant of his fortune and the proceeds of his daughter's literary industry. The father kept fresh in his daughter the keen delight in incongruities, the lively sympathy with self-willed vigorous individualist, the courtesy to all that inspired so many of her sketches of character. Miss Mitford lived in close attendance on him, refused all holiday invitations because he could not live without her, and worked incessantly for him except when she broke off her work to read him the sporting newspapers. Her writing has all the charm of perfectly unaffected spontaneous humour, combined with quick wit and exquisite literary skill. Miss Mitford met Elizabeth Barrett (Mrs Browning) in 1836, and the acquaintance ripened into a warm friendship. The strain of poverty began to tell on her
MITFORD, W.—MITHRADATES

work, for although her books sold at high prices, her income did not keep pace with her father's extravagances. In 1837, however, she received a civil list pension, and five years later her father died. A subscription was raised to pay his debts, and the surplus increased the daughter's income. Miss Mitford eventually removed to a cottage at Swallowfield, near Reading, where she died on the 10th of January 1835.

Miss Mitford's youthful ambition had been to be "the greatest English poetess," and her first publications were poems in the manner of Coleridge and Scott (Miscellaneous Verses, 1810, reviewed by Scott in the Quarterly; Christine, a metrical tale, 1811; Blanche, 1813). Her play Julian was produced at Covent Garden, with Macready in the title rôle, in 1823; The Foscari was performed at Covent Garden, with Charles Kemble as the hero, in 1826; Riest, 1828, the best of her plays, had a run of thirty-four nights, and Miss Mitford's friend, Talfourd, imagined that its vogue mitigated against the success of his own play Ion. Chatham Fforby was based upon a licence, with which the Lord Chamberlain, but was played at the Surrey Theatre in 1834.

But the prose, to which she was driven by domestic necessities, has rarer qualities than her verse. The first series of Our Village sketches appeared in 1824, a second in 1826, a third in 1828, a fourth in 1830, a fifth in 1832. Our Village was several times reprinted; Belford Regis, a novel in which the neighbourhood and society of Reading were idealized, was published in 1835.

Her Recollections of a Literary Life (1852) is a series of causties about her favourite books. Her talk was said by her friends, Mrs Browning and Hengist Horne, to have been even more amusing than her books, and five volumes of her Life and Letters, published in 1870 and 1872, show her to have been a delightful letter-writer.

MITFORD, WILLIAM (1744-1827), English historian, was the elder of the two sons of John Mitford, a barrister, who lived near Beaumieu, at the edge of the New Forest. Here, at Exbury House, his father's property, Mitford was born on the 9th of February 1744. After attending the College of St George, Sandwich, and the picturesque writer William Gilpin, but at the age of fifteen a severe illness led to his being removed, and after two years of idleness Mitford was sent, in July 1761, as a gentleman-commoner to Queen's College, Oxford. In this year his father died, and left him the Exbury property and a considerable fortune. Mitford, therefore, being "very much his own master, was easily led to prefer amusement to study." He left Oxford (where the only sign of assiduity he had shown was to attend the lectures of Blackstone) without a degree, in 1763, and proceeded to the Middle Temple. But when he married Miss Fanny Molloy in 1766, and retired to Exbury for the rest of his life, he made the study of the Greek language and literature his hobby and occupation.

After ten years his wife died, and in October 1776 Mitford went abroad. He was encouraged by French scholars whom he met in Paris, Avignon and Nice to give himself systematically to the study of Greek. Mitford was a member of the House of Commons, with intervals, from 1785 to 1816, and he was for many years verderer of the New Forest and a county magistrate; but it does not appear that he ever visited Greece. After a long illness, he died at Exbury on the 10th of February 1827. In addition to his History of Greece, he published a few smaller works, the most important of which was an Essay on the Harmony of Language, 1774. The style of Mitford is natural and lucid, but without the rich colour of Gibbon. He affected some oddities both of language and of orthography, for which he was censured and which he endeavoured to revise. But his political opinions were still more severely treated, since Mitford was an impassioned anti-Jacobin, and his partiality for a monarchy led him to be unjust to the Athenians. Hence his History of Greece, after having had no peer in European literature for half a century, faded in interest on the appearance of the work of Grote. Clinton, too, in his Fasti hellenici, charged Mitford with "a general negligence of dates," though admitting that in his philosophical range "he is far superior to any former writer" on Greek history. Byron, who dilated on Mitford's shortcomings, nevertheless declared that he was "perhaps the best of all modern historians altogether."

This Mitford certainly is not, but his pre-eminence in the little school of English historians who succeeded Hume and Gibbon it would be easier to maintain.

William Mitford's cousin, the Rev. John Mitford (1781-1859), was editor of the Gentleman's Magazine and of various editions of the English poets. For the Freeman-Mitfords, who were also relatives, see REDERSEALE, EARL OF.

MITHILA, an ancient kingdom of India, corresponding to that portion of Behar lying N. of the Ganges, with an extension into Nepal, where was the capital of Janakpur. Its early history is obscure, but it has always been noted for its peculiar conservatism and the learning of its Brahmins. They form to this day one of the five classes of northern Brahmins, and their head is the Maharaja of Darbanga. The language, known as Maithili, is a dialect of Bihari, with an archaic system of grammar and a literature of its own.

MITHRADATES, less correctly Mithradates, a Persian name derived from Mithras (q.v.), the sun-god, and the Indo-European root da, "to give," i.e. "given by Mithras." The name occurs also in the forms Mitridates (Herod. i. 110) and Meherdates (Tac. Ann. xii. 10). It was borne by a large number of Oriental kings, soldiers and statesmen. The earliest are Mithradates, the eunuch who helped Artabanus to assassinate Xerxes I. (Diod. xi. 69), and the Mithradates who fought first with Cyrus the Younger and after his death with Artaxerxes against the Greeks (Xen. Anab. ii. 5, 35; iii. 3, 10; iii. 4, 5, 8), and is the ancestor of the kings of Pontus. The most important are three kings of Parthia of the Arsacid dynasty, and six (or four) kings of Pontus. There were also two kings of Commagene, (two of the Bosporus and one of Armenia (A.D. 32-51).

MITHRADATES I. (Arsaces VI.), successor of his brother, Phraates I., came to the Parthian throne about 175 B.C. The first event of his reign was a war with Eucratides of Bactria, who tried to create a great Greek empire in the East. At last, when Eucratides had been murdered by his son about 150, Mithradates was able to occupy some districts on the border of Bactria and to conquer Arachosia (Kandahar); he is even said to have crossed the Indus (Justin 41, 6; Strabo xii. 515, 517; cf. Orosius v. 4, 16; Diod. 33, 18). Meanwhile the Seleucid kingdom was torn by internal dissensions, fostered by Roman intrigues. Phraates I. had already conquered eastern Media, about Rhagae (Rai), and subjected the Mares on the border of the Caspian (Justin 41, 5; Isidor. Charac. 7). Mithradates I. conquered the rest of Media and advanced towards the Zagros chains and the Babylonian plain. In a war against the Elymaeans (in Susiana) he took the Greek town Seleucia on the Euphrates, and forced their king to become a vassal of the Parthians (Justin 41, 6; Strabo xv. 744). About 141 he must have become master of Babylonia. By Diodorus 33, 18 he is praised as a mild ruler; and the fact that from 140 he takes on his coin the epithet Philhellen (W. Wroth, Catalogue of the Coins of Parthia, p. 14 seq.; still then he only calls himself "the great king Arsakes") shows that he tried to conciliate his Greek subjects. The Greeks, however, induced Demetrius II. Nicator to come to their delivery, although he was much pressed by Syria by the pretender Diodotus Tryphon. At first he was victorious, but in 138 he was defeated. Mithradates settled him with a royal household in Hycrania and gave him his daughter Rhodogune in marriage (Justin 36, 1, 38; Strabo xvi. 13, 5, 11; Euseb. Chron. i. 257; Appian, Syr. 67). Shortly afterwards Mithradates I died, and was succeeded by his son Phraates II. He was the real founder of the Arsacid Empire.

MITHRADATES II. the Great, king of Parthia (c. 120-88 B.C.), saved the kingdom from the Mongol Saace (Tochari),
who had occupied Bactria and eastern Iran, and is said to have extended the limits of the empire (Justin 42, 2, where he is afterwards confused with Mithradates III). He defeated King Ar Tatevanes of Armenia and conquered seventy valleys; and the prince Tigranes came as hostage to the Parthians (Justin 42, 2; Strabo, xi. 532). In an inscription from Delos (Dittenberger, Or. gr. inscr. 430) he is called "the great King of Kings Arsakes." He also interfered in the wars of the dynasts of Syria (Jos. Ant. xiii. 14, 3). He was the first Parthian king who entered into negotiations with Rome, then represented by Sulla, praetor of Cilicia (92 B.C.).

MITHRADATES III. murdered his father Phraates III. about 57 B.C., with the assistance of his brother Orodes. He was made king of Media, and waged war against his brother, but was soon deposed on account of his cruelty. He took refuge with Gabinius, the Roman proconsul of Syria. He advanced into Mesopotamia, but was beaten at Seleucia by Surenas, fled into Babylon, and after a long siege was taken prisoner and killed in 54 by Orodes I. (Dio Cass. 39, 56; Justin 43, 4; Jos. Bell. i. 8, 7, Ant. 14, 6, 4).

A Parthian king Mithradates, who must have occupied the throne for a short while the reign of Phraates IV., is mentioned by Jos. Ant. xvi. 8, 4, in 10 B.C.; another pretender Mardhates was brought from Rome in A.D. 49 by the opponents of Gotarzes, but defeated (Tac. Ann. xi. 10, xii. 10 sqq.). The name of another pretender Mithrades (often called Mithradates I.) occurs on a coin of the first half of the 2nd century, written in Aramaic, accompanied by the Arisaded titles in Greek (Wroth, Catal. of the Coins of Parthia, p. 219); he appears to be identical with Mardhates, one of the rivals for the Parthian throne who fought against Trajan in 116; he died in an attack on Commagene and appointed his son Sanatruces successor, who fell in a battle against the Romans (Arrian ap. Malalas, Chron. pp. 270, 274).

The kings of Pontus were descended from one of the seven Persian conspirators who put the false Smerdis to death (see DARIUS I.). According to Diodorus Siculus, three of the members of his family—Mithrades, Ariobarzanes, Mithradates—were successively rulers of Cius on the Propontis and Carinè in Mycia. The last of these was put to death in 302 B.C. by Antigonus, who suspected him of having joined the coalition against him. He was succeeded by his son Mithradates I. or III. (if the two dynasts of Cius be included!) the founder (eirenes) of the Pontic kingdom, although this distinction is by some attributed to the father and by his friend (eirenes) son of Antigonus, that he was threatened with the same fate as his father, he fled to Phrygia, where he seized Cimiana, a fort at the foot of the Olympos range. Being joined by the Macedonian garrison and the neighbouring populations, he conquered the Cappadocian and Phrygian territories on both sides of the Halys and assumed the title of king. Before his death he further enlarged Pontic Cappadocia. He was succeeded by Ariobarzanes, who left the throne to MITHRADATES II. (c. 256–190, according to Meyer, Mithradates II. and III.), a mere child. Early in his reign the Gauls of Galatia invaded his territory. Mithradates was at the battle of Ancyræ (c. 241), in which he assisted Antiochus Hierax against his brother Seleucus Callinicus, in spite of the fact that he had married the daughter of the latter with Greater Phrygia as her dowry. His two daughters, both named Laodice, were married, one to Antiochus the Great, the other to his cousin Achaæus, a dynasty of Asia Minor. He unsuccessfully attacked Sinope, which was taken by his successor Pharnaces, the brother (not the son) of MITHRADATES III. (169–121), surnamed Philopator, Philadæus, and Euergetes. Among his successors, there were two kings (Mithradates IV. Philopator and V. Euergetes). He was the last king of Pontus to recognize the suzerainty of the Romans, of whom he was a loyal ally. He assisted Attalus II. of Pergamus to resist Prusias II. of Bithynia; furnished a contingent during the Third Punic War; and aided the Romans in obtaining possession of Pergamus, bequeathed to them by Attalus III., but claimed by Ariosticus, a natural son of

1 There is much difference of opinion in regard to the kings of Pontus called Mithradates to the accession of Mithradates Eupator. Ed. Meyer reckons five, T. Reinhart three.

MITHRADATES VI. Eupator, called the Great, a boy of eleven, now succeeded his father. Alarmed at the attempts made upon his life by his mother, he fled to the mountains and was for many years a hunter. In 111 he returned to Sinope, threw his mother into prison, and put his younger brother to death. Having thus established himself on the throne, he turned his power against the conquered territory of the Thracians and the Scythians, the Greeks of the Cimmerian Bosporus and the Tauric Chersonese recognized his suzerainty. He occupied Colchis, Phrygian and part of Galatia; set his son Ariobarzanes on the throne of Cappadocia and drove out Nicomedes III., the young king of Bithynia. The Romans restored the legitimate kings, and, while apparently acquiescing, Mithradates made preparations for war. He had long hated the Romans, who had taken Phrygia during his minority, and he aimed at driving them from Asia Minor. The cause of rupture was the attack on Pontic territory by Nicomedes at the instigation of the Romans. Mithradates, unable to obtain satisfaction, declared war (88 B.C.). He rapidly overran Galatia, Phrygia and Asia, defeated the Roman armies, and ordered a general massacre of the Romans in Asia. He sent large armies into European Greece, and his generals occupied Athens. But Sulla in Greece and Smbria in Asia defeated his armies in several battles; the Greek cities were disgusted by his severity, and in 84 he concluded peace, abandoning all his conquests, surrendering his captives and giving up his war purposes. During what is called the Second Mithradatic War, Murena invaded Pontus without any good reason in 83, but was defeated in 82. Hostilities were suspended, but disputes constantly occurred, and in 74 a general war broke out. Mithradates defeated Cotta, the Roman consul, at Chalcedon; but Lucullus worsted him, and drove him in 72 to take refuge in Armenia with his son-in-law Tigranes. After two great victories at Tigranocerta (69) and Aratxata (68), Lucullus was disconcerted by mutiny and the defeat of his lieutenant Fabius (see LUCULLUS). In 66 he was superseded by Pompey, who completely defeated both Mithrades and Tigranes. The former established himself in 64 at Panticapaeum, and was planning new campaigns against the Romans when his own troops revolted, and, after vainly trying to poison himself, he ordered a Gallic mercenary to kill him. So perished the greatest enemy that the Romans had to encounter in Asia Minor. His body was sent to Pompey, who buried it in the royal sepulchre at Sinope.

Ancient authorities have invested Mithradates with a halo of romance. His courage, his bodily strength and size, his skill in the use of weapons, in riding, and in the chase, his speed of foot, his capacity for eating and drinking, his penetrating intellect and his mastery of 22 languages are celebrated to a degree which is almost incredible. With a surface gloss of Greek education, he united the subtlety, the superstition, and the obstinate endurance of an Oriental. He collected curiosities and works of art; he assembled Greek men of letters round him; he gave prizes to the greatest poets and the best eaters. He spent much of his time in practising magic, and it was believed that he had so saturated his body with poisons that none could injure him. He trusted no one; he murdered
his mother, his sons, the sister whom he had married; to prevent his harem from falling to his enemies he murdered all his concubines, and his most faithful followers were never safe. For eighteen years he showed himself no unworthy adversary of Sulla, Lucullus and Pompey.

See T. Reinach, *Mithridate Exapor* (1890; Ger. trans. by A. Goetz, 1895, with the author’s corrections and additions); also E. Meyer, *Geschichte des Königreichs Pontos* (1879).

**MITHRAS**, a Persian god of light, whose worship, the latest one of importance to be brought from the Orient to Rome, spread throughout the empire and became the greatest antagonist of Christianity.

I. History and Distribution.—The cult goes back to a period before the separation of the Persians from the Hindus, as is shown by references in the literatures of both stocks, the Avesta and the Vedas. Though but faintly pictured in the Vedic hymns, he is there invoked with Ormazd, or Ahuramazda, the god of the sky, and is clearly a divinity of light, the protector of truth and the enemy of error and falsehood. In the Avesta, after the separation of the Iranian stock from the Hindu and the rise of Zoroastrianism, which elevated Ormazd to the summit of the Iranian pantheon, Mithras was placed in a relatively minor and less important position; between Ormazd, who reigned in eternal brightness, and Ahirman, whose realm was eternal darkness, he occupied an intermediate position as the greatest of the yazatas, beings created by Ormazd to aid in the destruction of evil and the evil of the world. He was thus a deity of the realms of air and light, and, by transfer to the moral realm, the god of truth and loyalty. Because light is accompanied by heat, he was the god of vegetation and increase; he sent prosperity to the good, and annihilated the bad; he was the god of armies and the champion of heroes; as the enemy of darkness and of all evil spirits, he protected souls, accompanying them on the way to paradise, and was thus a redeemer. Animals and birds were sacrificed and libations poured to him, and prayers were addressed to him by devotees who had purified themselves by ablation and repeated flagellation. As a god who gave victory, he was prominent in the official cult of Persia, the seventh month and the sixteenth day of other months being sacred to him. His worship spread with the empire of the Persians throughout Asia Minor; he was an important centre. Its popularity remained unimpaired after the fall of Persia, and it was during the ferment following the conquests of Alexander that the characteristics which mark it during the Roman period were firmly fixed. Mithraism was at full maturity on its arrival at Rome, the only modifications it ever suffered having been experienced during its younger days in Asia.

Modified though never essentially changed, (1) by contact with the star-worship of the Chaldeans, who identified Mithras with Shamash, god of the sun,(2) by the indigenous Armenian religion and other local Asiatic faiths and (3) by the Greeks of Asia Minor, who identified Mithras with Helios, and contributed to the success of his cult by equipping it for the first time with artistic representations (the famous Mithras relief originated in the Pergamene school towards the 2nd century B.C.), Mithraism was first transmitted to the Roman world during the 1st century B.C. by the Cilician pirates captured by Pompey. It attained no importance, however, for nearly two centuries. The lateness of its arrival in the West was due to the fact that its centres of influence were not in immediate contact with the Persian or Roman empires. It never became popular in Greek lands, and was regarded by Hellenized nations as a barbarous worship. It was at rivalry with the Egyptian religion. As late as the time of Augustus it was but little known in Roman territory, and gained a firm foothold in Italy only gradually, as a result of the intercourse between Rome and Asia consequent upon the erection of the Eastern provinces and the submission and colonization of Mesopotamia. It seems at first to have had relations with the cult of the Great Mother of the Gods at Rome, whose influence served to protect it and facilitate its growth. The cult of Mithras began to attract attention at Rome about the end of the 1st century A.D. Statius (c. A.D. 80) mentions the typical Mithraic relief in his *Thebaid* (I. 719,720); from Plutarch’s *A.D. 46–125* Vita Pompei (24) it is apparent that the worship was well known; and the first Roman reliefs show the characteristics of about the same time.

Towards the close of the 2nd century the cult had begun to spread rapidly through the army, the mercantile class, slaves and actual propagandists, all of which classes were largely composed of Asians. It thrived especially among military posts, and in the track of trade, where its monuments have been discovered in greatest abundance. The German frontiers afforded most evidence of its prosperity. Rome itself was a favourite seat of the religion. From the end of the 2nd century the emperors encouraged Mithraism, because of the support which it afforded to the divine right of monarchs. The Persian belief that the legitimate sovereign reigned by the grace of Ormazd, whose favour was made manifest by the sending of the Hvarenò, a kind of celestial aureole of fire, resulted in the doctrine that the sun was the giver of the Hvarenò. Mithras, identified with Sol Invictus at Rome, thus became the giver of authority and victory to the imperial house. From the time of Constantine, who participated in its mysteries, its supporters were able to be found in all classes. Its importance at Rome may be judged from the abundance of monumental remains—more than 75 pieces of sculpture, 100 inscriptions, and ruins of temples and chapels in all parts of the city and suburbs.

Finally, philosophy as well as politics contributed to the success of Mithraism, for the outcome of the attempt to recognize in the Graeco-Roman gods only forces of nature was to make the Sun the most important of deities; and it was the Sun with whom Mithras was identified.

The beginning of the downfall of Mithraism dates from a.D. 275, when Dacia was lost to the empire, and the invasions of the northern peoples resulted in the destruction of temples along a great stretch of frontier, the natural stronghold of the cult. The aggression of Christianity also was now more effective. The emperors, however, favoured the cult, which was the army’s favourite until Constantine destroyed its hopes. The reign of Julian and the usurpation of Eugenius renewed the hopes of its devotees, but the victory of Theodosius (394) may be considered the end of its existence. It still survived at Rome, where the Emperor Valens (362–378) protected the cult of Mithras in the Vatican. It appears in Turkey as a popular cult to life with more tenacity in its Eastern home. Its legitimate successor was Manichaæism, which afforded a refuge to those mystics who had been shaken in faith, but not converted, by the polemics of the Church against their religion.

II. Sources, Remains, Ritual.—The sources of present knowledge regarding Mithraism consist of the Vedas, the Avesta, the Pahlevi writings, Greek and Latin literature and inscriptions, and the cult monuments. The monuments comprise the remains of nearly a score of temples and about 400 statues and bas reliefs. The Mithraic temples of Roman times were artificial grottoes (spelœa) wholly or partially underground, in imitation of the original secluded mountain caverns of Asia. The Mithraeum hewn in the tufa quarries of the Capitoline Hill at Rome, still in existence during the Renaissance, is an example. The main room of the ordinary temple was rectangular, with an elevated apsidal arrangement, like a choir, containing the sacred relief on its wall, at the end opposite the entrance, and with continuous benches (podia) of masonry, about 5 ft. wide and continuous benches towards the floor below, arranged along its long sides. The ceiling was made to symbolize the firmament. There were arrangements for the brilliant illumination of the choir and its relief, which was sometimes sculptured on both sides and reversible, while the podia were intentionally more obscure. The choir and the long space between the podia were for ministers, the podia themselves for kneeling worshippers. Two altars, to the Sun and the Moon, stood before the former, and cult statues along the latter. The approach to the grotto lay through a portico on the level with and fronting the street, and a praetorium, in communication with which was a kind of sacristy. Steps led to the lower level of the sanctuary. The
simplicity and smallness of the Mithraic temples are to be accounted for by structural and financial reasons; an underground temple was difficult to construct on a large scale, and the first inhabitants of the Mithraea were usually from the lower classes. The average grotto held from fifty to a hundred persons. The size of the sanctuaries, however, was compensated for by their number; in Ostia alone there were five.

The typical bas relief, which is found in great abundance in the museums of Europe, invariably represents Mithras, under the form of a youth with conical cap and flying drapery, slaying the sacred bull, the scorpion attacking the genitals of the animal, the serpent drinking its blood, the dog springing towards the wound in its side, and frequently, in addition, the Sun-god, his messenger the raven, a fig-tree, a lion, a ezer, and torch-bearers. The relief is in some instances enclosed in a frame of figures and scenes in relief. The best example is the monument of Osterburken (Cumont, Textes et monuments figurés, No. 246). With this monument as a basis, Franz Cumont has arranged the small Mithraic reliefs into two groups, one illustrating the legend of the origin of the gods, and the other the legend of Mithras. In the first group are found Infinite Time, or Cronus; Tellus and Atlas supporting the globe, representing the union of Earth and Heaven; Oceanus; the Fates; Infinite Time giving into the hand of his successor Ormazd the thunderbolt, the symbol of authority; Ormazd struggling with a glare of evil—the Mithraic gigantomachy. The second group represents, first, the birth of Mithras; then the god nude, cutting fruit and leaves from a fig-tree, which is the bust of a deity, and before which one of the winds is blowing upon Mithras; the god discharging an arrow against a rock from which springs a fountain whose water a figure is kneeling to receive in his palms; the bull in a small boat, near which again occurs the figure of the animal under a roof about to be set on fire by two figures; the bull in flight, with Mithras in pursuit; Mithras bearing the bull on his shoulders; Helios kneeling before Mithras; Helios and Mithras clasping hands over an altar; Mithras with drawn bow on a running horse; Mithras and Helios banquetting; Mithras and Helios mounting the chariot of the latter and rising in full course over the ocean. Few of the Mithraic reliefs are of even mediocre art. Among the best is the relief from the Capitoline grotto, now in the Louvre.

Cumont’s interpretation of the main relief and its smaller companions involves the reconstruction of a Mithraic theology, a Mithraic legend, and a Mithraic symbolism. Faucon’s evidence makes the task difficult. The head of the divine hierarchy of Mithras was Infinite Time, or Cronus, Saturn; Heaven and Earth were his offspring, and Earth, who formed with them the world, was the one corresponding to Earth. Mithras was the most important member of the circle. He was regarded as the mediator between suffering humanity and the unknowable and inaccessible god of all being, who reigned in the ether. The Mithras legend has been lost, and can be reconstructed only from the scenes on the above described relief. Mithras was born of a rock, the marvel being seen only by certain shepherds, who brought gifts and adored him. Chilled by the wind, the new-born god went to a fig-tree, partook of its fruit, and clothed himself in its leaves. He then undertook to vanquish the beings already in the world, and rendered subject to him first the Sun, with whom he concluded a treaty of friendship. The most wonderful of his adventures, however, was that with the sacred bull which had been created by Ormazd. The hero seized it by the horns and was borne headlong in the flight of the animal, which he finally subdued and dragged into a cavern. The bull escaped, but was overtaken, and by order of the Sun, who sent his messenger the raven, was reluctantly sacrificed by Mithras. From the dying animal sprang the life of the earth, although Ahriman sent his emissaries to prevent it. The soul of the bull rose to the celestial spheres and became the guardian of herds and flocks under the name of Silvanus. Mithras was through his deed the creator of life. Meanwhile Ahriman sent a terrible drought upon the land. Mithras defeated his purpose by discharging an arrow against a rock and miraculously drawing the water from it. Next Ahriman sent a deluge, from which one man escaped in a boat with his cattle. Finally a fire desolated the earth, and only the creatures of Ormazd escaped. Mithras, his work accomplished, banqueted with the Sun for the last time, and was taken by him in his chariot to the habitation of the immortals, whence he continued to protect the faithful.

The symbolism employed by Mithraism finds its best illustration in the large central relief, which represents Mithras in the act of slaying the bull as a sacrifice to bring about terrestrial life, and thus portrays the concluding scenes in the legend of the sacred animal. The scorpion, attacking the genitals of the bull, is sent by Ahriman from the lower world to defeat the purpose of the sacrifice; the dog, springing towards the wound in the bull’s side, was venerated by the Persians as the companion of Mithras; the serpent, the symbol of the earth being made fertile by drinking the blood of the sacrificed bull; the raven, towards which Mithras turns his face as a sign of direction, is the herald of the Sun-god, whose bust is near by, and who has ordered the sacrifice; various plants near the bull, and heads of wheat springing from his tail, symbolize the result of the sacrifice; the cypress is perhaps the tree of immortality. There was also an astrological symbolism, but it was superficial, and of secondary importance. The torch-bearers sometimes seen on the relief represent one being in three aspects—the morning, noon and evening sun, or the vernal, summer and autumn sun.

Owing to the almost absolute disappearance of documentary evidence, it is impossible to know otherwise than very imperfectly the inner life of Mithraism. Jerome (Epist. civ.) and inscriptions preserve the knowledge that the mystic, sacramus, passed through seven degrees, which probably corresponded to the seven planetary spheres traversed by the soul in its progress to wisdom, perfect purity, and the abode of the blest: Corax, Raven, so named because the raven in Mithraic mythology was the servant of the Sun; Cyprihus, Occult, a degree in the taking of which the mystic was perhaps hidden from others in the sanctuary by a veil, the removal of which was a solemn ceremony; Miles, Soldier, signifying the holy warfare against evil in the service of the god; Leo, Lion, symbolic of the element of fire; Perses, Persian, clad in Asiatic costume, a reminiscence of the ancient origin of the religion; Heliodromus, Courier of the Sun, with whom Mithras was identified; Pater, Father, a degree bringing the mystic among those who had the general direction of the cult for the rest of their lives. One relief (Cumont, vol. i. p. 175, fig. 10) shows figures masked and costumed to represent Corax, Perses, Miles and Leo, indicating the practice on occasion of rites involving the use of sacred disguise, a custom probably reminiscent of the primitive time when men represented their deities under the form of animals, and believed themselves in closer communion with them when disguised to impersonate them. Of the seven degrees, those mystics not yet beyond the third, Miles, were not in full communion, and were called impersores (servants); while the fourth degree, Leo, admitted them into the class of the fully initiate, the merchories (participants). No women were in any way connected with the cult, though the male sex could be admitted even in childhood. The time requisite for the several degrees is unknown, and may have been determined by the Patres, who conferred them in a solemn ceremony called Sacramentum, in which the initial step was an oath never to divulge what should be revealed, and for which the mystic had been specially prepared by lustral purification, prolonged abstinence, and severe deprivations. Special ceremonies accompanied
MITHRAS

the diverse degrees: Tertullian speaks of "marking the forehead of a Miles," which may have been the branding of a Mithraic sign; honey was applied to the tongue and hands of the Leo and the Perses. A sacred communion of bread, water and possibly wine, compared by the Christian apologists to the Eucharist, was administered to the mystic who was entering upon one of the advanced degrees, perhaps Leo. The ceremony was probably commemorative of the banquet of Mithras and Helios before the former's ascension, and its effect strength of body, wisdom, prosperity, power to resist evil, and participation in the immortality enjoyed by the god himself. Other features reminiscent of the original barbarous rites in the primitive caverns of the East, no doubt also occupied a place in the cult; bandaging of eyes, binding of hands with the intestines of a fowl, leaping over a ditch filled with water, witnessing a simulated murder, are mentioned by the Pseudo-Augustine; and the manipulation of lights in the crypt, the administration of oaths, and the repetition of the sacred formulæ, all contributed toward inducing a state of ecstatic exaltation. What in the opinion of Albrecht Dieterich (Eine Mithrasliturgie, Leipzig, 1876) is a Mithras liturgy is preserved in a Greek MS. of Egyptian origin of about A.D. 300. It is the ritual of a magician, imbedded in which, and alternating with magic formulæ and other occult matter, are a number of invocations and prayers which Dieterich reconstructs as a liturgy in use by the clergy of Mithras between A.D. 100 and 300, and adapted to this new use about the latter date.

The Mithraic priest, sacerdos or antistes, was sometimes also of the degree of pater. Tertullian (De praescr. haeret. 40) calls the chief priest summus pontifex, probably the pater patrum who had general supervision of all the initiates in one city, and states that he could marry but once. According to the same author, there were Mithraic, as well as Christian, virginæ et continentes. Besides the administration of sacraments and the celebration of offices on special occasions, the priest kept the festival in the altar, addressed prayers to the Sun at dawn, midday and twilight, turning towards east, south, and west respectively. Glad in Eastern paraphernalia, he officiated at the numerous sacrifices indicated by the remains of iron and bronze knives, hatchets, chains, ashes and bones of oxen, sheep, goats, swine, fowl, &c. There was pouring of libations, chanting and music, and bells and candles were employed in the service. Each day of the week was marked by the adoration of a special planet, the sun being the most sacred of all, and certain days, perhaps the sixteenth of each month and the equinoxes, in conformity with the character of Mithras as mediator, were set aside for special festivals.

The Mithraic community of worshippers, besides being a spiritual fraternity, was a legal corporation enjoying the right of holding property, with temporal officials at its head, like any other sodalités: there were the decuriones and decem primi, governing councils resembling assembly and senate in cities; magistri, annually elected presidents; curatorœ, financial agents; defensores, advocates; and patroni, protectors among the influential. It may be that a single temple was the resting place of several small associations of worshippers which were subdivisions of the whole community. The cult was supported mainly by voluntary contribution. An abundance of epigraphic evidence testifies to the devotion of rich and poor alike.

III. Moral Influence.—Therapadeumivice of Mithraism was due to its human qualities. Its communities were bound together by a sense of close fraternal relation. Its democracy obliterated the distinctions between rich and poor; slave and senator became subject to the same rule, eligible for the same honours, partners of the same communion, and were interred in the same type of sepulchre, to await the same resurrection. The reward of title and degree and the consequent rise in the esteem of his fellows and himself was also a strong incentive; but the Mithraic faith itself was the greatest factor. The impressiveness and the stimulating power of the mystic ceremonies, the consciousness of being the privileged possessor of the secret wisdom of the ancients, the sense of purification from sin, and the expectation of a better life where there was to be compensation for the sufferings of this world—were all strong appeals and enlarged nature. The necessity of moral rectitude was itself another incentive. Courage, watchfulness, striving for purity, were all necessary in the incessant combat with the forces of evil. Resistance to sensuality was one aspect of the struggle, and asceticism was not unknown. Mithras was ever on the side of the faithful, who were certain to triumph both in this world and the next. The worthy soul ascended to its former home in the skies by seven gates or degrees, while the unworthy soul descended to the realms of Ahriman. The doctrine of the immortality of the soul was accompanied by that of the resurrection of the flesh; the struggle between good and evil was one day to cease, and the divine bull was to appear on earth, Mithras was to descend to call all men from their tombs and to separate the good from the bad. The bull was to be sacrificed to Mithras, who was to mingle its fat with consecrated wine and give to drink of it to the just, rendering them immortal, while the unjust, together with Ahriman and his spirits, were to be destroyed by a fire sent from Heaven by Ormaad. The universe, renewed, was to enjoy eternal happiness.

IV. Relation to Christianity.—What was most interesting aspect of Mithraism is its antagonism to Christianity. Both religions were of Oriental origin; they were propagated about the same time, and spread with equal rapidity on account of the same causes, viz. the unity of the political world and the debasement of its moral life. At the end of the 2nd century each had advanced to the farthest limits of the empire, though the one possessed greatest strength on the frontiers of the Teutonic countries, along the Danube and the Rhine, while the other thrived especially in Asia and Africa. The points of collision were especially at Rome, in Africa, and in the Rhône Valley, and the struggle was the more obstinate because of the ressemblances between the two religions, which were so numerous and so close as to be the subject of remark as early as the 2nd century, and the cause of mutual recrimination. The fraternal and democratic spirit of the first communities, and their humble origin; the identification of the object of adoration with light and the Sun; the legends of the shepherds with their gifts and adoration, the flood and the ark; the representation in art of the fiery chariot, the drawing of water from the rock, the use of bell and candle, holy water and the communion; the sanctification of Sunday and of the 25th of December; the insistence on moral conduct, the emphasis placed upon abstinence and self-control; the doctrine of heaven and hell, of primitive revelation, of the mediation of the Logos emanating from the divine, the atoning sacrifice, the constant warfare between good and evil and the final triumph of the former, the immortality of the soul, the last judgment, the resurrection of the flesh and the fiery destruction of the universe—are some of the resemblances which, whether real or only apparent, enabled Mithraism to prolong its resistance to Christianity. At their root lay a common Eastern origin rather than any borrowing.

On the other hand, there were important contrasts between the two. Mithraism courted the favour of Roman paganism and established orthodoxy with polytheism, while Christianity was uncompromising. The former as a consequence won large numbers of supporters by the possibility it afforded of adopting an attractive faith which did not involve a rupture with the religion of Roman society, and consequently with the state. In the middle of the 3rd century Mithraism seemed on the verge of becoming the universal religion. Its eminence, however, was so largely based upon dailiance with Roman society, its weakness so great in having only a mythical character, instead of a personality, as an object of adoration, and in excluding women from its privileges, that it fell rapidly before the assaults of Christianity. Manichæism, which combined the adoration of Zoroaster and Christ, became the refuge of those supporters of Mithraism who were inclined to compromise, while many found the transition to orthodox Christianity easy because of its very resemblance to their old faith.
MITRA—MITRE

625

See Franz Cumont, Textes et monuments figurés relatifs aux mystères de Mihrâb (Brussels, 1896, 1899), which has superseded all publications on the subject; Albrecht Dieterich, Eine Mithras—liturgie (Leipzig, 1903). See also the translation of Cumont’s first work into English, in the first volume of the Paris Bibliothèque numismatique (1891), and separately in 1901, under the title Les Mystères de Mihrâb, by T. J. McCormack (Chicago and London, 1903). Extended bibliography in Roscher’s Lexicon der Mythologie.

MITRA, RAJENDRA LALA (1824—1891), Indian Orientalist, was born in a suburb of Calcutta on the 15th of February 1824, of a respectable family of the Kayasth or writer caste of Bengal.

To a large extent he was self-educated, studying Sanskrit and Persian in the library of his father. In 1846 he was appointed librarian of the Asiatic Society, and to that society the remainder of his life was devoted—first as a philological secretary, as vice-president, and as the first native president in 1885. Apart from very numerous contributions to the society’s journal, and to the series of Sanskrit texts entitled “Bibliotheca indicâ,” he published three separate works: (1) The Antiquities of Orissa (2 vols., 1875 and 1880), illustrated with photographic plates, in which he traced back the image of Jagannath (Juggernaut) and also the car-festival to a Buddhistic origin; (2) a similarly illustrated work on Bodh Gaya (1878), the hermitage of Sakya Muni, and (3) Indo-Aryans (2 vols., 1881), a collection of essays dealing with the manners and customs of the people of India from Vedic times. He received the honorary degree of L.L.D. from the university of Calcutta in 1875, the companionship of the Indian Empire when that order was founded in 1876, and the title of raja in 1888. He died at Calcutta on the 26th of July 1891.

MITRE (Lat. mitra, from Gr. miýrê, a band, head-band, head-dress), a liturgical head-dress of the Catholic Church, generally proper to bishops.

1. Latin Rite.—In the Western Church its actual form is that of a sort of folding cap consisting of two halves which, when not worn, lie flat upon each other. These sides are stiffened, and when the mitre is worn, they rise in front and behind like two horns pointed at the tips (cornua mitrae). From the lower rim of the mitre at the back hang two bands (infusae), terminating in fringes. In the Roman Catholic Church mitres are divided into three classes: (1) Mitra pretiosa, decorated with jewels, gold plates, &c.; (2) Mitra auriphrygialia, of white silk, sometimes embroidered with gold and silver thread or small pearls, or of cloth of gold plain; (3) Mitra simplex, of white silk damask, silk or linen, with the two falling bands terminating in red fringes. Mitres are the distinctive head-dress of bishops; but the right of wearing a mitre, as of the other dignity of the sacred order, is granted by the popes to other dignitaries—such as abbots or the heads and sometimes all the members of the chapters of cathedral or collegiate churches.

In the case of these latter, however, the mitre is worn only in the church to which the privilege is attached and on certain high festivals. Bishops alone, including of course the pope and his cardinals, are entitled to wear the pretiosa and auriphrygialia; the others wear the mitra simplex.

The proper symbol of episcopacy is not so much the mitre as the ring and pastoral staff. It is only after the service of consecration and the mass are finished that the consecrating prelate asperses and blesses the mitre and places on the head of the newly consecrated bishop, according to the prayer which accompanies the act, “the helmet of protection and salvation,” the two horns of which represent “the horns of the Old and New Testaments,” a term to “the enemies of truth,” and also “the two brazen horns of truth” which God set on the brow of Moses on Mount Sinai. There is no suggestion of the popular idea that the mitre symbolizes the “tongues of fire” that descended on the heads of the apostles at Pentecost.

According to the Roman Caeremonial the bishop wears the mitra pretiosa on high festivals, and always during the singing of the Te Deum and the Gloria at mass. He is allowed, however, “on account of its weight,” to substitute for the pretiosa the auriphrygialia during part of the services, i.e. at Vespers from the first psalm to the Magnificat, at mass from the end of the Kyrie to the canon. The auriphrygialia is worn during Advent, and from Septuagesima to Maundy Thursday, except on the third Sunday in Advent (Gaudete), the fourth in Lent (Laetare) and on such greater festivals as fall within this time. It is worn, too, on the vigils of fasts, Ember Days, Corpus Christi, and. Maundy Thursday. The mitra simplex may be substituted for it in the same way as the auriphrygialia, and at the presanctification of the Eucharist, at the solemn benediction of the Blessed Sacrament, at the blessing of the candles at Candlemas, the singing of the absolution at the coffin, and the solemn investiture with the pallium. At provincial synods archbishops and bishops wear the mitra simplex, and mitres of all the simplexes. At general councils bishops wear white linen mitres, cardinals mitres of white silk damask; this is also the case when bishops and cardinals in pontificalibus assist at a solemn pontifical function, and are dressed in the pontifical vestments.

Lastly, the mitre, though a liturgical vestment, differs from the others in that it is never worn when the bishop addresses the Almighty in prayer—e.g. during mass he takes it off when he turns to the altar, placing it on his head again when he turns to address the people (see 1 Cor. xi. 4).

The origin and antiquity of the episcopal mitre have been the subject of much debate. Some have claimed for it apostolical sanction and found its origin in the liturgical head-gear of the Jewish priesthood. Such proofs as have been adduced for this view are, however, based on the fallacy of reading into words (mitra, infusa, &c.) used by early writers a special meaning which they only acquired later. Mitra, even as late as the 15th century, retained its simple meaning of cap (see Du Cange, Glossarium, s.n.); to Isidore of Seville it is specifically a woman’s cap. Infusa, which in late ecclesiastical usage was to be confined to mitre (and its dependent bands) and chasuble, meant originally a piece of cloth, or the sacred fillets used in pagan worship, and later on came to be used of any ecclesiastical vestment, and there is no evidence for its specific application to the liturgical head-dress earlier than the 12th century. With the episcopal mitre the Jewish miznephet, translated “mitre” in the Authorized Version (Exod. xxviii. 4, 36), has nothing to do, and there is no evidence for the use of the former before the middle of the 6th century even in Rome, and elsewhere than in Rome it does not make its appearance until the 11th.

The first trustworthy notice of the use of the mitre is under Pope Leo IX. (1049—1054). This pope invested Archbishop Eberhard of Trier, who had accompanied him to Rome, with the Roman mitra, telling him that he and his successors should wear it in ecclesiastico officio (i.e. as a liturgical ornament) according to Roman custom, in order to remind him that he is a disciple of the Roman see (Jaffé, Regesta pont. rom., ed. Leipzig, 1888, No. 4158). This proves that the use of the mitre had been for some time established at Rome; that it was specifically a Roman ornament; and that the right to wear it was only granted to ecclesiastics elsewhere as an exceptional honour.

On the other hand, the Roman ordines of the 8th and 9th centuries make no mention of the mitra; the evidence goes to prove that this liturgical head-dress was first adopted by the popes some time in the 10th century, and Father Braun shows convincingly that it was in its origin nothing else than the papal regnum or phrygium which, originally worn only at outdoor processions and the like, was introduced into the church, and thus developed into the liturgical mitre, while outside it preserved its original significance as the papal

1 Father Braun, S. J., has dealt exhaustively with the supposed evidence for its earlier use. The best modern commentary on the mitra mentioned by Theodulf of Orleans (Paraecon. ad episc.) is the Jewish miznephet, and the well-known miniature of Gregory the Great (not St Dunstan, as commonly assumed) wearing a mitre (in Cluniac MS. Claudia at the Bibl. Nat., Paris). The same MS., often ascribed to the 10th or early 11th century, he judges from the form of the pallium and dalmatic to have been produced at the end of the 11th century, at earliest. The papal bulls granting the use of mitres to cardinals in the 11th century are all forgeries (Liturgische Gewandung, 431—448).

2 That it had been already so granted is proved by a miniature containing the earliest extant representations of a mitre, in the Escultura rotula and baptismal rotula at Bari (reproduced in Bertheau, L’Art dans l’Ilese méridionale, I, Paris, 1904).
of the head instead of the sides (the mitre said to have belonged to St Thomas Becket, now at Westminster Cathedral, is of this type), and with this the essential character of the mitre, as it persisted through the middle ages, was established. The exaggeration of the height of the mitre, which began at the time of the Renaissance, reached its climax in the 17th century.

**FIG. 1.**—Evolution of the Mitre from the 11th century to the present day.

This ugly and undignified type is still usually worn in the Roman Catholic Church, but in some cases the earlier type has survived, and many bishops are also now reverting to it.

The decoration of mitres was characterized by increasing elaboration as time went on. From the first the white conical cap seems to have been decorated round the lower edge by a band or orphrey (circulus). To this was added later a vertical orphrey (medallion), usually from the centre of the front of the circulus to that of the back, partly in order to hide the seam, partly to emphasize the horns when those were to left and right. When the horns came to be set before and behind, the vertical orphrey retained its position. Of the surviving early mitres the greater number have only the orphrey embroidered, the body of the mitre being left plain. Very early, however, the custom arose of ornamenting the triangular spaces between the orphreys with embroidery, usually a round medallion, or a star, set in the middle, but sometimes figures of saints, &c. (e.g. the early example from the cathedral of Anagni, reproduced by Braun, p. 466). The richness and variety of decoration increased from the 14th century onwards. Architectural motives even were introduced, as friezes to the embroidered sides of saints, while sometimes the upper edges of the mitre were ornamented with crockets, and the horns with architectural finials. Finally, the traditional circulus and titulus seem all but forgotten, the whole front and back surfaces of the mitre being ornamented with embroidered pictures or with arabesque patterns. The latter is characteristic of the mitre in the modern Roman Catholic Church, the tradition of the local Roman Church having always excluded the representation of figures on ecclesiastical vestments.

2. Reformed Churches.—In most of the reformed Churches the use of mitres was abandoned with that of the other vestments. They have continued to be worn, however, by the bishops of the Scandinavian Lutheran Churches. In the Church of England the use of the mitre was discontinued at the Reformation. There is some evidence to show that it was used in consecrating bishops up to 1552, and also that its use was revived by the Laudian bishops in the 17th century (Hierurgia Anglicana ii. 242, 243, 246). In general, however, there is no evidence to prove that this use was liturgical, though the silver-gilt mitre of Bishop Wren of Ely (d. 1667), which is preserved, is judged from the state of the lining to have been worn. The instances of the use of the mitre quoted in Hier. anglic. ii. 310, as carried by the bishop of Rochester at an investiture of the Knights of the Bath (1735); and by the archbishops and bishops at the coronation of George II. (1727), have no liturgical significance. The tradition of the mitre as an episcopal ornament has, nevertheless, been continuous in the Church of England, and that on three lines: (1) heraldic usage; (2) its presence on the head of effigies of bishops, of which a number are extant, of the 16th, 17th, 18th and 19th centuries; (3) its presence in funeral processions, where

1 In Father Braun's opinion, expressed to the writer, this mitre, which was formerly at Sens, belongs probably to the 13th century.
Fig. 6.—Mitre (restored) of William of Wykeham, Bishop of Winchester (d. 1404), preserved at New College, Oxford.

Fig. 7.—Flemish Mitre, embroidered in gold thread, and the panels in colours, with figures of the Virgin and St. Augustine. The other side is similar, with figures of St. Leonard and St. Mary Magdalene. It is dated 1592, repaired in 1766.

In the Victoria and Albert Museum.

an actual mitre or the figure of one was sometimes carried, and sometimes suspended over the throne." (Report on the Ornaments of the Church, p. 160). The liturgical use of the mitre was revived in the Church of England in the latter part of the 19th century, and is now fairly widespread.

3. Oriental Rites.—Some form of liturgical head-dress is common to all the Oriental rites. In the Orthodox Eastern Church the mitre (Gr. μετρα; Slav. mitra) is, as in the Western Church, proper only to bishops. Its form differs entirely from that of the Latin Church. In general it rather resembles a closed crown, consisting of a circlet from which rise two arches intersecting each other at right angles. Circlet and arches are richly chased and jewelled; they are filled out by a cap of stiff material, often red velvet, ornamented with riches in embroidery or appliqué metal. Surmounting all, at the intersection of the arches is a cross. In Russia this usually lies flat, only certain metropolitans, and by prescription the bishops of the eparchy of Kiev, having the right to have the cross upright (see fig. 2). In the Armenian Church priests and archdeacons, as well as the bishops, wear a mitre. That of the bishops is of the Latin form, a custom dating from a grant of Pope Innocent III.; that of the priests, the sagochar, is not unlike the Greek mitre (see fig. 3). In the Syrian Church only the patriarch wears a mitre, which resembles that of the Greeks. The biruma of the Chaldaean Nestorians, on the picture illustrated, worn by all bishops, is a sort of hood ornamented with a cross. Coptic priests and bishops wear the balim, a long strip of stuff ornamented with crosses &c., and wound turban-wise round the head; the patriarch of Alexandria has a helmet-like mitre, the origin of which is unknown, though it perhaps antedates the appearance of the phrygium at Rome. The Maronites, and the uniate Jacobites, Chaldaeces and Copts have adopted the Roman mitre.

The mitre was only introduced into the Greek rite in comparatively modern times. It was unknown in the earlier part of the 15th century, but had certainly been introduced by the beginning of the 16th. Father Braun suggests that this assumption by the Greek patriarch was connected with the changes due to the capture of Constantinople by the Turks. Possibly, as its form suggests, it is based on the imperial crown and symbolized at the outset the quasi-sovereignity over the rajah population which Mahommed II. was content to leave to the patriarch. In 1589 it was introduced into Russia, when the tsar Theodore erected the Russian patriarchate and bestowed on the new patriarch the right to wear the mitre, sakkos and mandyass, all borrowed from the Greek rite. A hundred years later the mitre, originally confined to the patriarch, was worn by all bishops.

See J. Braun, S.J., Die liturgische Gewandung (Freiburg-im-Brissau, 1907), pp. 424-426. The question of the use of the mitre in the Anglican Church is dealt with in the Report of the Sub-Committee of the Convocation of Canterbury on the Ornaments of the Church and Clerical Vestments (1908). See also the bibliography of the article (W. A. P.)

MITROVICA (Hungarian, Mitrovics; German, Mitrovitsa), a town of Croatia-Slavonia, Hungary, situated on the river Save, in the county of Syrmia. Pop. (1900), 11,518. Mitrovica is on the railway from Agram, 170 m. W.N.W. to Belgrade, 38 m. E. by S. Roman remains have been discovered in its neighbourhood, and it occupies the site of Sirmium or Syrmium, the chief city of Lower Pannonia under Roman rule. The emperor Probus (232-282) was born and buried at Sirmium, where, according to some authorities, the emperor Marcus Aurelius (121-180) also died; but this is uncertain. In 351, 357 and 358, ecclesiastical councils of some importance met at Sirmium, which became an episcopal see about 305, and was united with the diocese of Bosnia in 1773. The city was sacked by the Huns in 441, and by the Turks, who destroyed all its ancient buildings in 1566 and 1571.

MITSCHERLICH, EILHARDT (1794-1836), German chemist, was born on the 7th of January 1794 at Neuenburg near Jever, in the grand duchy of Oldenburg, where his father was pastor. His uncle, CHRISTOPH WILHELM MITSCHERLICH (1760-1854), professor at Göttingen, was in his day a celebrated scholar. He was educated at Jever under the historian F. C. Schlosser, when he went to Heidelberg in 1811, devoted himself to philosophy, giving special attention to the Persian language. In 1813 he went to Paris to obtain permission to join the embassy which Napoleon I. was to send to Persia. The events of 1814 put an end to this, and Mitscherlich resolved to study medicine in order that he might enjoy that freedom of travel usually allowed in the East to physicians. He began at Göttingen with the study of chemistry, and this so arrested his attention that he gave up the journey to Persia. From his Göttingen days dates the treatise on certain parts of Persian history, compiled from MSS. in the university library and published in Persian and Latin in 1814, under the title Mirchondi historia Thakeridurum historicis nostris hucusque incoignitorum Persico principum. In 1818 he went to Berlin and worked in the laboratory of H. F. Link (1767-1851). There he made analyses of phosphates and phosphites, arsenates and arsenites, confirming the conclusions of J. J. Berzelius as to their composition; and his observation that corresponding phosphates and arsenates crystallize in the same form was the germ from which grew the theory of isomorphism which he communicated to the Berlin Academy in December 1819. In that year Berzelius suggested Mitscherlich to the minister Altenstein as successor to M. H. Klaproth at Berlin. Altenstein did not immediately carry out this proposal, but he obtained for Mitscherlich a government grant to enable him to continue his studies in Berzelius’s laboratory at Stockholm. He returned to Berlin in 1821, and in the summer of 1822 he delivered his first lecture as extraordinary professor of chemistry in the university, where in 1825 he was appointed ordinary professor. In the course of an investigation into the slight differences discovered by W. H. Wollaston in the angles of the rhombohedra of the carbonates isomorphic with calc-spar, he observed that the angle in the case of calc-spar varied with the temperature. On extending his inquiry to other aehotopic crystals he observed a similar variation, and was thus led, in 1825, to the discovery that aehotopic crystals, when heated, expand unequally in the direction of dissimilar axes. In the following year he discovered the change, produced by change of temperature, in the direction of the optic axes of selenite. His investigation (also in 1826) of the two crystalline modifications of sulphur threw much light on the fact that the two minerals calc-spar and aragonite have the same composition but different crystalline forms, a property which Mitscherlich called dimorphism. In 1833 he made a series of careful determinations of the vapour densities of a large
number of volatile substances, confirming Gay-Lussac's law. He obtained sebacic acid in 1827 and showed that its salts are isomorphous with the sulphates, while a few years later he proved that the same thing is true of the manganates and the sulphates, and of the permanganates and the perchlorates. He investigated the relation of benzene to benzoic acid and to other derivatives. In 1829-1830 he published his *Lehrbuch der Chemie*, which embodied many original observations. His interest in mineralogy led him to study the geology of volcanic regions, and he made frequent visits to the Eifel with a view to the discovery of a theory of volcanic action. He did not, however, publish any papers on the subject, though after his death his notes were arranged and published by Dr. J. L. A. Roth in the *Memosirs* of the Berlin Academy (1860). In December 1861 symptoms of heart-disease made their appearance, but he was able to carry on his academic work till December 1862. He died at Schonberg near Berlin, on the 28th of August 1863.

Mitscherlich's published papers are chiefly to be found in the *Abhandlungen* of the Berlin Academy, in Foggendorf's *Annalen*, and in the *Annales de chimie et de physique*. The 4th edition of the *Lehrbuch der Chemie* was published in 1844-1847, a 5th was begun in 1855, but was not completed.

**MITTEN,—** a covering for the hand, with a division for the thumb only, and reaching to the lower joint of the fingers; it is made of silk, lace, wool or other material. The word is of obscure origin; it has been connected with Ger. *mitte*, middle, half, in the sense of that which half covers the hand. There are several Celtic words which may be cognate, e.g. Irish *mitog*, *mutan*, a thick glove, mitten, such as is worn by hedges and ditchers. The 16th-century French word *miton* meant a gauntlet. A fine mitten made of lace or open network and extending well up the forearm was much worn by ladies in the early part of the 19th century, and has been fashionable at various times since that date.

**MITTWEIDA,** a town of Germany in the kingdom of Saxony, on the Zschopau, 12 m. by rail N. of Chemnitz on the railway to Döbeln and Riesa. Pop. (1903), 17,465. It has a handsome Evangelical church, a classical, a modern and a technical school, and cotton and spinning mills. Other industries are the making of tobacco, matches, and perfumery.

**MIVART, ST. GEORGE JACKSON** (1827-1900), English biologist, was born in London on the 30th of November 1827, and educated at Clapham grammar-school, Harrow, and King's College, London, and afterwards at St Mary's, Oscott, since his conversion to Roman Catholicism prevented him from going to Oxford. In 1851 he was called to the bar, but he devoted himself to medical and biological studies. In 1852 he was appointed lecturer at St Mary's Hospital medical school, in 1869 he became a fellow of the Zoological Society, and from 1874 to 1877 he was professor of biology at the short-lived Roman Catholic University College, London. In 1873 he published *Lessons in Elementary Anatomy*, and an essay on *Man and Ape*. In 1881 appeared the *Cat: an Introduction to the Study of Back-boned Animals*. The careful and detailed work he bestowed on Insectivora and Carnivora largely increased our knowledge of the anatomy of these groups. In 1871 his *Genus of Species* brought him into the controversy then raging. Though admitting evolution generally, Mivart denied its applicability to the human intellect. He held that the relationship existing between human nature and intellect and animal nature was a difference in *Nature and Thought* (1882); and in the *Origin of Human Reason* (1885) he stated what he considered the fundamental difference between men and animals. In 1884, at the invitation of the Belgian episcopate, he became professor of the philosophy of natural history at the university of Louvain, which had conferred on him the degree of M.D. in 1884. Some articles published in the *Nineteenth Century* in 1882 and 1893, in which Mivart advocated the claims of science even where they seemed to conflict with religion, were placed on the *Index expurgatorius*, and other articles in January 1900 led to his excommunication by Cardinal Vaughan, with whom he had a curious correspondence vindicating his claim to hold liberal opinions while remaining in the Roman Catholic Church. Shortly afterwards he died, in London, on the 5th of April 1900. Mivart was also the author of many scientific papers and occasional articles, and of *Castle and Manor: A Tale of our Time* (1900), which originally appeared in 1894 as *Henry Standon*, by "D'Arcy Drew."

**MIZPAH, or Mizpeh**, the name of several places referred to in the Old Testament, in each case probably derived from a "commanding prospect," the Hebrew name having that significance. (1) *Mizpah of Gilead*, where Jacob was reconciled to Laban (Gen. xxxi. 40); apparently the site of the camp of the Israelites when about to attack the Ammonites under Jephthah's leadership (Judges x. 17). This ancient sanctuary was probably the scene of Jephthah's vow (Judges xi. 20; cf. v. 11). The identification of this Mizpeh is a difficult problem: it is supposed to be the same as Ramoth Gilead, but the evidence is scarcely conclusive. It is referred to in Hos. v. 1. (2) *Mizpah of Benjamin*. It has been suggested, on hardly sufficient grounds, that the Mizpeh where the Hebrews assembled before the extermination of the Benjamites (Judges xx. 1) was not the shrine where Samuel made his headquarters (1 Sam. vii. 5). It was fortified by Asa (1 Kings xvii. 22), and after the destruction of Samaria was the seat of government under the viceroy Gedaliah (2 Kings xxiv. 16). After the exile it returned the traditional government (Neh. iii. 7) and a holy place (1 Macc. iii. 46). It is probably to be identified with the mountain, Nebi Samwil, north of Jerusalem, still considered sacred by the Moslems: a Crusaders' church (now a mosque), covers the traditional tomb of Samuel. (3) A territory near Mount Hermon, a seat of the Hivites, which joined the coalition of Jabin against Joshua (Joshua xi. 3). In the territory was the "valley of Mizpeh" (v. 8) where the Canaanites were routed. (4) A town in the tribe of Judah (Joshua xv. 38). (5) *Mizpeh of Moab*, where David interviewed the king of Moab and found an asylum for his parents (1 Sam. xxii. 3).

**MIZRAIM**, the biblical name for Egypt (Gen. x. 6, 13, Hebrew *Midyan*; the apparently dual termination *-aim* may be due to a misunderstanding); there is an alternative poetical form *Mášár* (2 Kings xix. 24, &c.). In Isa. xi. 11 the name is kept distinct from Pathros or Upper Egypt, and represents some portion of Lower Egypt. It probably means "boundary," or "frontier," a somewhat ambiguous term, which illustrates the topographical problems. First (c. E. Schürer) pointed out in 1874 that the Assyrians knew of some Mušri (i.e. Mizraim) in North Syria, and it is extremely probable that this land is referred to in 2 Kings vii. 6 (mentioned with the Hittites), and in 1 Kings x. 28 seq., 2 Chron. i. 16 seq., where the word "droves" (Heb. *m-š-r*) conceals the contiguous land Kue (Cilicia). 1 Next (b), C. T. Beke, as long ago as 1834, concluded in his *Origines biblicae* (p. 167 et passim) that "Egypt" in the Old Testament sometimes designates a district near Midian and the Gulf of Akaba, and the view restated recently and quite independently by H. Winckler on later evidence (1893) has been the subject of continued debate. Egypt is known to have laid claim to the southern half of Palestine from early times, and consequently the extension of the name of Egypt beyond the limits of Egypt and of the Sinaic peninsula, is inherently probable. When, for example, Hagar, the "Egyptian," is the ancestress of Ishmaelites tribes, the evidence makes it very unlikely that the term is to be understood in the strict ethnical sense, and there are more passages more suitably interpreted on the hypothesis that the wider extension of the term was once familiar. In the second half of the 8th century B.C., Assyrian inscriptions allude to a powerful Mušri at a time when the Nile empire was disintegrated and scarcely in a position to play the part ascribed to it (i.e. if by Mušri we are to understand Egypt). 2 Not until the supremacy of TIRAHKH does the ambiguity begin to disappear, and much depends upon the

---

2 So, too, according to one passage, Tigrath-pileser IV, appoints a governor over Mušri before Egypt itself had actually been conquered.
considerable importance to the art, but more to the principle of order as the best help to memory, speaks of Carneades (or perhaps Charrondes) of Athens and Metrodorus of Scæpius as distinguished examples of the use of well-ordered images to aid the memory. The latter is said by Pliny to have carried the art so far "ut nihil non isdem verba redderet auditis." The Romans valued such helps as giving facility in public speaking. The method used is described by the author of Rhet. ad Heren., iii. 16—24; see also Quintilian (Inst. Or. xi. 2), whose account is, however, somewhat incomplete and obscure. In his time the art had almost ceased to be practised. The Greek and Roman system of mnemonics was founded on the use of mental places and signs or pictures, known as "topical" mnemonics. The most usual method was to choose a large house, of which the apartments, walls, windows, statues, furniture, &c., were severally associated with certain names, phrases, events or ideas, by means of symbolic pictures; and to recall these it was only necessary to search over the apartments of the house till the particular place was discovered where they had been deposited by the imagination. In accordance with this system, if it were desired to fix an historic date in the memory, it was localized in an imaginary town divided into a number of districts, each with ten houses, each house with ten rooms, and each room with a hundred quadrates or memory-places, partly on the floor, partly on the four walls, partly on the roof. Thus, if it were desired to fix in the memory the date of the invention of printing (1436), an imaginary book, or some other symbol of printing, was placed in the thirty-sixth quadrat or memory-place of the fourth room of the first house of the historic district of the town. Except that the rules of mnemonics are referred to by Martianus Capella, nothing further is known regarding the practice of the art until the 15th century. Among the voluminous writings of Roger Bacon is a tractate De arte memorativa. Raimon Lull devoted special attention to mnemonics in connexion with his Ars generalis. The first important modification of the method of the Romans was that invented by the German poet Konrad Celtis, who, in his Epistola in utroque Ciceronis rhetoricam cum arte memorativa novo (1492), instead of places made use of the letters of the alphabet. About the end of the 15th century Petrus de Ravenna (b. 1448) awakened such astonishment in Italy by his mnemonic feats that he was believed by many to be a necromancer. His Phoenix artis memoriae (Venice, 1491, 4 vols.) went through as many as nine editions, the seventh appearing at Cologne in 1608. An impression equally great was produced about the end of the 16th century by Lambert Schenkel (Gasophylacium, 1610), who taught mnemonics in France, Italy, and Germany, and, although he was denounced as a sorcerer by the university of Louvain, published in 1593 his tractate De memoria at Douai with the sanction of that celebrated theological faculty. The most complete account of his system is given in two works by his pupil Martin Sommer, published at Venice in 1610. In 1618 John Willis (d. 1628) published Mnemonica; sive ars reminiscendi (Eng. version by Leonard Sowersby, 1661; extracts in Feinaigle's New Art of Memory, 3rd ed., 1834), containing a clear statement of the principles of the system of Petrus de Ravenna, in connexion with his exposition of the Ars generalis of Lull, included a memoria technica in his treatise De umbbris idearum. Other writers of this period are the Florentine Publici (1482); Johann Rombergh (1533); Hieronymo Morafioti, Ars memorie (1602); B. Porta, Ars reminiscendi (1602).

In 1648 Stanislaus Mink von Wenusheim or Winckelmann made known what he called the "most fertile secret" in mnemonics—namely, the use of consonants for figures, so as to express numbers by words (vowels being added as required); and the philosopher Leibnitz adopted an alphabet very similar to that of Winckelmann in connexion with his scheme for a form of writing common to all languages. Winckelmann's method, which in fact is adopted with slight changes by the majority of subsequent "original" systems, was modified and supplemented in regard to many details by Richard Grey (1694—1771), who published a Memoria technica in 1790. The

unbiased discussion of the related biblical history (especially the writings of Isaiah and Hosea) and the Egyptian data. But even in the later period of disintegration the monarchs of the Delta were no doubt associated with their eastern neighbours, and the Assyrian Muṣri stands in the same relation to the people of Philistia as do the Edomites and allied tribes of the Old Testament, Philistia itself was always intimately associated with Egypt. (See Philistines.)

The problem is complicated by the obscurity which overlies the history of south Palestine and the Delta (see Edom; Midian). The political importance of Egypt was not constant, and the known fluctuations of geographical terms combine with the doubtful accuracy of early writers to increase the difficulties. The Assyrian evidence alone points very strongly to a Muṣri in north-west Arabia; the biblical evidence alone suggests an extra-Egyptian Misraḥam. On the whole the result of discussion has been to admit the probability that Misraḥam could refer to a distinct outside the limits of Egypt proper. But it has not justified the application of this conclusion to all the instances in which some critics have relied upon it, or the sweeping inferences and reconstructions which have sometimes been based upon it. Each case must be taken on its merits.

MNEMONICS (from Gr. ἡμήνων, remember; whence μνήμων, mindful; τό μνημονικόν, sc. τέχνη, that which mechanically aids the memory), the general name applied to devices for aiding the memory. Such devices are also described as memoria technica. The principle is to enable the mind to reproduce a relatively unfamiliar idea, and specially a series of dissociated ideas, by connecting it, or them, in some artificial whole, the parts of which are mutually suggestive. A pupil is far more likely to remember the cities which claimed to be the birthplace of Homer when he remembers that their names can be made to form the hexameter line "Smyrna, Colophon, Smyrna, Rhodes, Argos, Athenae." Among the most famous examples of metrical mnemonics are the "gender rhymes" of the Latin grammars, the hexameter lines (especially that beginning "Barbara Celerant") invented by logicians (for a list see Baldwin's Dict. of Philos., vol. ii., s.s., "Mnemonic Verses"), the verse for remembering the number of days in the months ("Thirty days hath September, April, and June and November"). Other devices are numerous. Thus the name and lights of the sides of a ship may be remembered because the three shorter words "port," "left," "red," go together, as compared with the longer, "starboard," "right," "green.

Memory is commonly classified by psychologists according as it is exercised (a) mechanically, by attention and repetition; (b) judiciously, by careful selection and co-ordination; and (c) ingeniously, by means of artificial, i.e. mnemotechny, mnemones. It must, however, be observed that no mnemonics is of any value which does not possess the qualities of (a) and (b). A mnemonic is essentially a device which uses attention and repetition, and careful selection is equally necessary. A more accurate description of mnemonics is "mediate" or "indirect" memory. In the technical sense the word "mnemonic" is confined to the systems of general application which have been elaborated by various writers.

Systems.—Mnemonic devices were much cultivated by Greek sophists and philosophers, and are repeatedly referred to by Plato and Aristotle. In later times the invention was ascribed to the poet Simonides,1 perhaps for no other reason than that the strength of his memory was famous. Cicero, who attaches

1 Pliny, H.N. vii. 24. Cicero, De or. ii. 86, mentions this belief without committing himself to it.
principal part of Grey's method (which may be compared with the Jewish system by which letters also stand for numerals, and therefore words or dates) is briefly this: "To remember anything in history, chronology, geography, &c., a word is formed, the beginning whereof, being the first syllable or syllables of the thing sought, does, by frequent repetition, of course draw after it the latter part, which is so contrived as to give the answer. Thus, in history, the Deluge happened in the year before Christ two thousand three hundred forty-eight; this is signified by the word Del- etok, Del standing for Deluge and etok for 2348." To assist in retaining the mnemonic words in the memory they were formed into memorial lines, which, however, being composed of strange words in difficult hexameter scanion, are by no means easy to memorize. The vow or consonant, which Grey connected with a particular figure, was chosen arbitrarily; but in 1806 Gregor von Feinaigle, a German monk from Salem near Constance, began in Paris to expound a system of mnemonics, one feature (based on Winckelmann's system) of which was to represent the numerical figures by letters chosen on account of some similarity to the figure to be represented or some accidental connexion with it. This alpha was equally used in connexion of localities and signs. Feinaigle, who apparently published nothing himself, came to England in 1811, and in the following year one of his pupils published The New Art of Memory, which, beside giving Feinaigle's system, contains valuable historical material about previous systems. A simplified form of Feinaigle's method was published by Aimé Paris (Principes et applications diverses de la mnémonique, 7th ed., Paris, 1834), and the use of symbolic pictures was revived in connexion with the latter by a Pole, Antoni Jaźwinski, of whose system an account was published by the Polish general J. Ben, under the title Exposé général de la méthode mnémonique polonaise, perfectionnée à Paris (Paris, 1835). Various other modifications of the systems of Feinaigle and Aimé Paris were advocated by subsequent mnemonists, among them being the Phenotypoes of Major Beniowsky, a Polish refugee, the Phreno-Mnemotechny (1845) of François Faubel Gouraud the Mnemotechnic of Karl Otto Reventlow (generally known as Karl Otto), a Dane, and the Mnemotechny of the American Riley Miles. The more complicated mnemonic systems have fallen almost into complete disuse; but methods founded chiefly on the so-called laws of association (see Association of Ideas) have been taught with some success in Germany by, among others, Hermann Kothe, author of Lehrbuch der Mnemonik (2nd ed., Hamburg, 1853), and Katechismus der Gedächtnisskunst (6th ed. by Montag, Leipzig, 1887); and Hugo Weber-Rumpe, author of Mnemonische Zahlwörterbuch (Breslau, 1885) and Mnemonische Unterrichtsbücher (1887–1888); in England by Dr Edward Pick, whose Memory and the Rational Means of Improving it (5th ed., 1873) and Lectures on Memory Culture (1899) obtained a wide circulation. Passing over the work of William Day (New Mnemotechnical Chart and Guide to the Art of Memory, 1845), Rev. T. Brayshaw (Medical Mnemonics, a very rare work), Fairchild and W. Stokes, the next name of any importance is the Rev. J. H. Bacon, a pupil of Edward Pick. His book (A Complete Guide to the Improvement of the Memory, 3rd ed., rev. 1890) contains a good summary of the history of mnemonics and a very reasonable account of the principles; it gains in value by its comparative simplicity. More or less successful systems were issued by Lyon Williams (1866), T. Maclean (1866), Thomas A. Sayer (1867), Rev. Alexander Mackay (1869), George Crowther (1870), F. Appleby (1880), John Sambrook, who made use of similarities in sounds (gun, Jew, 2), the French scientist Abbé Moigno, J. H. Noble, and Allan Dalzell. Considerable interest was roused both in London and in America by the controversy which raged round the system of "Alphonse Loisierte," who taught his "art of never forgetting" successively in London and Washington. It claimed to be original in system, but was attacked in England by F. Appleby and in America by George S. Fellows, and is generally regarded as both unoriginal and inferior on the whole to preceding systems (for the litigation in America see e.g. Part II. of Middleton's Memory Systems, pp. 96 sqq.).

An interesting work (Memoranda Mnemonica) was published by James Copner in 1893, containing a system based partly on the use of letters for figures and words for dates, as well as a large number of rhymes for remembering facts in biblical, Roman, Greek and English history. He made use of Grey's system, but endeavoured as far as possible to invent, where necessary, words and terminations which in themselves had some special fitness in place of Grey's monstrosities. More complicated systems are the Kesving Memory System (Auckland, 1896), the Smith-Watson System of Memory and Mental Training (Washington), and the Pelman memory system.

BIBLIOGRAPHY.—A large number of the works referred to in the text contain historical material. Among histories of the subject, mention may be made of the American Mnemonistik and the Phreno- Mnemotechny of (1810); A. E. Middleton, Memory Systems, Old and New (1899), with bibliography of works from 1235 to 1888 by G. S. Fellows and account of the Loizeau litigation; F. W. Colegrove, Memory (1901), with bibliography, pp. 385–391.

MNECLES, the architect of the great Propylaæ of the Acropolis, set so by Pericles about 437 B.C.

MOA, an Acropolis, set so by Pericles about 437 B.C.
The affinities of the moas are undoubtedly with the Australian Ratitae, and, in spite of the differences mentioned above, with the kiwis. In this respect Max Fürbringer and T. J. Parker are in perfect agreement. The relationship with Aepyornis of Madagascar is still problematic. Whilst the moas seem to have been entirely herbivorous, feeding not unlike upon the shoots of ferns, the kiwis have become highly specialized worm-eaters. In this respect cassowaries and emus hold an intermediate position, their occasional zoophagous (especially piscivorous) inclination being well known. Unmolested by enemies (Harpagornis, a tremendous bird of prey, died out with the Pleistocene), living in an equable insular climate, with abundant vegetation, the moas flourished and seem to have reached their greatest development in specialization, numbers, and a bewildering variety of large and small kinds, within quite recent times. Unfortunately no fossil moas, older than the Pleistocene, are known. Parker recognizes five genera, with about twenty species, which he combines into three sub-families: Dinornithinae with Dinornis, Anomalopteryginae with Pachyornis, Mesopteryx and Anomalopteryx, comprising the comparatively least specialized forms; and Enineae with the genus Emeus, not to be confounded with the vernacular emu. The moas ranged in size from that of a turkey to truly colossal dimensions, the giant being Dinornis maximus, which, with a tibial length of 39 in., stood with its small head about 12 ft. above the ground.

(H. F. G.)

MOAB, the name of an ancient people of Palestine who inhabited a district E. of the Jordan and the Dead Sea, lying N. of Ammon, and S. of Moab (q.v.); for a sojourner in Moab, a son of Lot, according to Gen. xxxii. 13; 35; these events, assigned to an early age, have been connected with the appearance of Moabite power west of the Jordan in the days of the judge Ehud (q.v.). However, all that is recorded in Num. xxii. sqq., together with various legal and other matter, not severe the accounts of the Israelite occupation of east Jordan (Num. xxi. 33-35, xxxii. 39-42). For full details see G. B. Gray, "Numbers" (Introd. Critical Comment.).

Although Moab and Ammon were brothers, their history was usually associated with that of Judah and Israel respectively, and naturally depended to a considerable extent upon these two and their mutual relations. Jephthah (q.v.), one of the Israelite judges, delivered Gilead from Ammon, who resumed her attack under the king Nahash, only to be repulsed by Saul (q.v.). Ehud (q.v.) of Benjamin or Ephraim (q.v.) freed Israel from the Moabite oppression. To the first great kings, Saul and David, are ascribed conquests over Moab, Ammon and Edom. The Judaean David, for his part, sought to cultivate friendly relations with Ammon, and tradition connects him closely with Moab. His son Solomon contracted marriages with women of both states (1 Kings xi. 5, 7), thus introducing into Jerusalem cults which were not put down until almost at the close of the monarchy (2 Kings xxiii. 13). In the 9th century B.C. the two states appear in more historical surroundings, and the discovery of a lengthy Moabite inscription has thrown valuable light upon contemporary conditions.

This inscription, now in the Louvre, was found at Dhibbân, the biblical Dibón, in 1868 by the Rev. F. Klein, a representative of the Church Mission Society stationed at Jerusalem. It contains a record of the successes of the Moabite king Mesha against Israel.1 Omri (q.v.) had previously seized a number of Moabite cities north of the Arnon, and for forty years the Moabite national god Chemosh was angry with his land. At length he roused Mesha; and Moab, which had evidently retreated southwards towards Edom, now began to take reprisals. "The men of God had dwelt in the land of 'Ataroth from of old; and the king of Israel built 'Atonath for himself." Mesha took the city, slew its people in honour of Chemosh, and dragged before the god the altar-hearth (or the priest?) of D-v-d-h (apparently a divine name, but curiously similar to David). Next Chemosh roused Mesha against the city of Nebo. It fell with its thousands, for the king had "devoted" it to the deity 'Ashtar-Chemosh. Yahweh had been worshipped there, and its temple was supplied with incense and vessels, or perhaps the same doubtful word as above) were dragged before the Chemosh altars. After the two of these and other victories (at Jahaz, Aroer, &c.), Moab recovered its territory, fortified its cities, supplied them with cisterns, and Mesha built a great sanctuary to his god. The inscription enumerates many places known elsewhere (Isa. xv. ; Jer. xlviii.), but although it mentions the "men of Gad," makes no allusion to the Israelite tribe Reuben, whose seat lay in the district (Num. xxxii. ; Josh. xiii. 15-23; see REUBEN). The revolt will have followed Ahab's death (see 2 Kings i. 1) and apparently led to the unsuccessful attempt by Jehoram to recover the lost ground (ibid. iii.).

The story of Jehoram in 2 Kings iii. now gives prominence to Edom. Jehoram, as wonders how he shall be able to recover the aged Jeheshaphat of Judah. Following other synchronisms, the Septuagint (Lucian's recension) names Ahaziah of Judah; from 2 Kings i. 17, the reigning king could only be Jehoram's son Ahaziah; in 2 Kings iv. 24, however, another Ahaziah appears. The king of Edom was a vassal of Israel and Judah (contrast 1 Kings xxii. 47; 2 Kings viii. 20), and hostile to Moab (comp. above, and the obscure allusion in Amos ii. 1-2). But the king of Moab's attempt to break through unto him suggests that in the original story (those are several signs of revision) Moab and Edom were in alliance. In this case the object of Jehoram's march round the south of the Dead Sea was to drive a wedge between them, and the result hints at an Israelite disaster. Singularly enough, the story of Jehoram and the Edomites associated from Edom at Zair, an unknown name for which Ewald suggested (the Nabataean) (2 Kings viii. 21; see JEHORAM).

Moab thus retained its independence, even harrying Israel with marauding bands (2 Kings iii. 20), while Ammon was

perpetrating cruelties upon Gilead (Am. i. 13 seq.). But under Jeroboam II. (q.v.) Israelite territory was extended to the Wadi of the 'Arabah or wilderness (probably south end of the Dead Sea), and again Moab suffered. If Isa. xxv. seq. is to be referred to this age, its people fled southwards and appealed for protection to the overlords of Edom (see UZIAH). During the Assyrian supremacy, its king Salammanu (probably not the Shalman of Hos. x. 14) paid tribute to Tiglath-Pileser IV., but joined the short-lived revolt with Judah and Philistia in 711. When Sennacherib besieged Jerusalem in 701, Kamus (Chemosh) -nadab submitted, and subsequently both Esarhaddon and Assur-bani-pal mentioned the Moabite king Muṣûr ("the Egyptian," but cf. MIZRAIM) among their tributaries. In fact, during the period of Assur-bani-pal Moab played the vassal's part in helping to repulse the invasion of the Nabayat and nomads of Kedar, a movement which made itself felt from Edom nearly as far as Damascus. It had its root in the revolt of Samas-sum-yukin (Shamash-shun-ukin) of Babylon, and coming at a time immediately preceding the disintegration of the Assyrian Empire, may have had most important consequences for Judah and Israel (see above, p. 116). Ziz became an important international centre.

Moab shares with Ammon and Edom in the general obscurity which overhangs later events. If it made inroads upon Judah (2 Kings xxiv. 2), it joined the coalition against Babylon (Jer. xxvii. 3); if it is condemned for its untimely joy at the fall of Jerusalem (Isa. xxv. 9 seq.; Jer. lviii.; Ezek. xxv. 8-11; Zeph. ii. 8-10), it had offered a harbour to fugitive Jews (Jer. xi. 11). The dates of the most significant passages are unfortunately uncertain. If Sanballat the Horonite was really a native of the Moabite Horonaim, he finds an appropriate place by the side of Tobiah the Ammonite and Gashmu the Arabian among the strenuous opponents of Nehemiah. Still later we find Moab part of the province of Arabia in the hands of fresh tribes from the Arabian desert (Jos. Ant. xii. 13, 5); and, with the loss of its former independent power, the name survives merely as a type (Dan. xi. 41). (See JEWs; NABATAEANS.)

A populous land commanding the trade routes from Arabia to Damascus, rich in agricultural and pastoral wealth, Moab, as Mesha's inscription proves, had already reached a high state of civilization by the 9th century B.C. Its language differed only dialectically from Hebrew; its ideas and religion were very closely akin to the Israelite, and it may be assumed that they shared in common many features of culture. The relation of Chemosh, the national god, to his "children" (Num. xx. 29) was that of Yahweh to Israel (see especially Judges xi. 24). He had his priests (Jer. xlvi. 7), and Mesha, perhaps himself a priest-king, receives the oracles direct or through the medium of his prophets. The practice of devoting, banishing or annihilating city or community was both Moabite and Israelite (cf. above, also Deut. iii. 34, iii. 6, xx. 10-20; 2 Chron. xxv. 12, &c.), and human sacrifice, offered as an exceptional gift to Chemosh in 2 Kings iii. 27, in Israel to Molech (q.v.), was a rite once more rare. Apart from the religious cult suggested in the name Mount Nebo, there were local cults of the Baal of Peor and the Baal of Moab, and Mesha's allusion to 'Ashtar-Chemosh, a compound deity, had been taken to point to a corresponding consort whose existence might naturally be expected upon other grounds (see ASHTAR). The fertility of Moab was manifested in wine and corn, the temperate climate and the enervating heat supply conditions which directed the form of culture. Nature-worship, as in Israel, lay at the foundation, and the impure rites of Shittim and Baal-Peor (Num. xxxii. 16; Ps. civ. 28) would not materially differ from practices which Israelite prophets were called upon to condemn. Much valuable evidence is to be obtained also from the survival of ancient forms of cult in Moab and east of the Jordan (e.g. sacrifices on the house roofs) and from a survey of epigraphical and other data from the Greek, Roman, and later periods, allowance being made for contamination. The whole question deserves careful investigation in the light of comparative religion.

The relationship felt between Israel and the external states (Moab, Edom, and Ammon) is entirely justified. It extends intermittently throughout the history, and certain complicated features in the traditions of the southern tribes point to affinities with Moab which find a parallel in the traditions of David (see RUTH) and in the allusions to intercourse between Moab and Benjamin (1 Chron. viii. 8) or Judah (ibid. iv. 21 seq.). But the obscure historical background of the references makes it uncertain whether the exclusiveness of orthodox Judaisms (Neh. xiii. 1-3; cf. Deut. xxiii. 3; Ezra ix. 1, 12) was imposed upon an earlier catholicity, or represented only one aspect of religious spirit, or was succeeded by a more tolerant attitude. Evidence for the last-mentioned has been found in the difficult narrative in Jos. xxii. But Israel remained a great power in religious history while Moab disappeared. It is true that Moab was charitably related to the Funai and pagan tribes of the desert, and the exposed condition of the land is emphasized by the ruined fortresses and castles which even the Romans were compelled to construct. The explanation of the comparative insignificance of Moab, however, is not to be found in purely topographical considerations. Nor can it be sought in political history, since Israel and Judah suffered as much from external movements as Moab itself. The explanation is to be found within Israel itself, in factors which succeeded in re-shaping existing material and in impressing upon it a durable stamp, and these factors, as biblical tradition recognizes, are to be found in the work of the prophets.

See the articles on Moab in Hastings's Dict. Bible (W. H. Bennett, Ency. Bib. (G. A. Smith and Wellhausen), and Hauck's Religionsge- schichte (F. Winckler) with other references; also the popular description by W. Libbey and F. E. Hoskins, Jordan Valley and Petra (1905), and the very elaborate and scientific works by R. E. Brinnow and A. von Domaszewski, Die Provincia Arabia (1904-1905), and A. Musil, Arabia Petraea (1907-1908). Mention should be made of the mosaic map of Palestine found at Medaba, dating perhaps from the 9th century A.D.: for this, see A. Jacoby, Das geograph. Mosaik von M. (1905), and F. Palmer and Guthe (1906). For language and culture see Nabataeans, and NABATAEAN LANGUAGE, and for topography, &c., PALESTINE; and for the later history, JEWs.

MO'ALLAKAT (MO'ALLAQAT or MU'ALLAQAT). Al-Mo'allakat is the title of a group of seven longish Arabic poems, which have come down to us from the time before Islam. The name signifies "the suspended" (pl.), the traditional explanation being that these poems were hung up by the Arabs on or in the Ka'ba at Mecca. The oldest passage known to the present writer where this title is stated occurs in the 'Iqd of the Spanish Arab, Ibn 'Abd-Rabbiihi (A.D. 896-940), Bulaq ed. of 1293 A.H. vol. iii. p. 116 seq. We read there: "The Arabs had such an interest in poetry, and valued it so highly, that they took seven long pieces selected from the ancient poetry, wrote them in gold on pieces of Coptic linen folded up, and hung them up (u'allaq) on the curtains which covered the Ka'ba. Hence we speak of 'the golden poem of Amra'al Qais,' the golden poem of Zuhair. The number of these golden poems is seven; these poems are called Mu'allaqat (u'allaq) and their number of statements are found in later Arabic works. But against this we have the testimony of a contemporary of Ibn 'Abd-Rabbiihi, the grammarians Nāḥḥās (d. A.D. 949), who says in his commentary on the Mu'allaqat: "As for the assertion that they were hung up in [sic] the Ka'ba, it is not known to any of those who have handed down ancient poems." This cautious scholar is unquestionably right in rejecting a story so utterly unauthentic.

The customs of the Arabs before Mahomet have been recorded by various authors, among whom the following are among the most important: Apianus, his Itinerarium (q.v.); Cart. I. G. Nicolaus (q.v.). …
are pretty accurately known to us; we have also a mass of information about the affairs of Mecca at the time when the Prophet arose; but no trace of this or anything like it is found in really good and authentic authorities. We hear, indeed, of a man hanging up a spoil of battle on the Ka‘ba (Ibn Hisām, ed. Wūstenfeld, p. 431). Less credible is the story of an important document being deposited in that sanctuary (ibid. p. 230), for this looks like an instance of later usages being transferred to pre-Islamic times. But at all events this is quite a different thing from the hanging up of poetical manuscripts. To account for the disappearance of the Mo‘allakat from the Ka‘ba we are told, in a passage of late origin (De Sacy, Chrestom. ii. 480), that they were taken down at the capture of Mecca by the Prophet. But in that case we should expect some hint of the occurrence in the circumstantial biographies of the Prophet, and in the works on the history of Mecca; and we find no such thing. That a series of long poems was written at all at that remote period is improbable in the extreme. Up to a time when the art of writing had become far more general than it was before the spread of Islam, poems were never—or very rarely—written, with the exception, perhaps, of epistles, and a poetic form. The diffusion of poetry was committed to oral tradition. Moreover, it is quite inconceivable that there should have been either a gild or a private individual of such acknowledged taste, or of such influence, as to bring about a consensus of opinion in favour of certain poems. Think of the mortal offence which the canonization of one poet must have given to his rivals and their tribes. It was quite another thing for an individual to give his own private estimate of the respective merits of two poets who had appealed to him as uimple, or for a number of poets to appear at large gatherings, such as the fair of ‘Oqāz (Okad) as candidates for the place of honour in the estimation of the throne which listened to their recitations. No better is the modifications of the legend, which we find, at a much later period, in the Mogaddima of Ibn Khuldūn (A.D. 1337–1406), who tells us that the poets themselves hung up their poems on the Ka‘ba (ed. Paris iii. 357). In short, this legend, so often retailed by Arabs, and still more frequently by Europeans, must be entirely rejected.1 The story is a pure fabrication based on the name “suspended.” The words was taken in its literal sense, and as these poems were preserved by many above all others in after times, the same opinion was attributed to “the ancient Arabs,” who were supposed to have given effect to their verdict in the way already described. A somewhat simpler version, also given by Naḥḥās in the passage already cited, is as follows: “Most of the Arabs were accustomed to meet at ‘Oqāz and recite verses; then, if the king was pleased with any poem, he said, ‘Hang it up, and preserve it among my treasures.’” But, not to mention other difficulties, there was no king of all the Arabs; and it is hardly probable that any Arabian king attended the fair at ‘Oqāz. The story that the poems were written in gold has evidently originated in the name “the golden poems” (literally “the gilded”), a figurative expression for excellence. We may interpret the designation “suspended” on the same principle. It seems to mean those (poems) which have been raised, on account of their value, to a specially honourable position. Another derivative of the same root is ʿāqf, “precious thing.” A clearer significance attaches to another name sometimes used for these poems—assumal, “the strings of pearls.” The comparison of artificially elaborated poems to these strings is extremely apt. Hence it became so popular—that, even in ordinary prose, to speak in rhythmical form is called simply nasīm—“string pearls.”

The selection of these seven poems can scarcely have been

1 Doubts had already been expressed by various scholars, when Henstenberg—rigid conservative as he was in theology—openly challenged it, and Sprenger (Das Leben des Mohammed, i. 14, Berlin, 1861) declared it a tale. Since then it has been controverted at length in Nöldeke’s Beiträge zur Kenntnis der Poetik der alten Araber (Hanover, 1864), p. xvii. sqq. Alwardt concurs in this conclusion; see his Bemerkungen über die Aechtheit des alten arabischen Gedichte (1872), pp. 25 sqq. the work of the ancient Arabs at all. It is much more likely that we owe it to some connoisseur of a later date. Now Naḥḥās says expressly in the same passage: “The true view of the matter is this: when Ḥammād ar-Rāwiyā (Ḥammād the Rhapsodist) saw how little men cared for poetry, he collected these seven pieces, urged people to study them, and said to them: ‘These are the [poems] of renown.’” And this agrees with all our other information. Ḥammād (who lived in the first three quarters of the 8th century A.D.) was perhaps of all men the one who knew most Arabic poetry by heart. The recitation of poems was his profession. To such a rhapsodist the task of selection is in every way appropriate; and it may be assumed that he is responsible also for the somewhat fantastic title of “the suspended.”

There is another fact which seems to speak in favour of Ḥammād as the compiler of this work. He was a Persian by descent, but a client of the Arab tribe, Bakr ibn Wālī. For this reason, we may suppose, he not only received into the collection a poem of the famous poet Ṭarafa, of the tribe of Bakr, but also that of another Bakrite, Hārīth, who, though not counted a hard of the highest rank, had been a prominent chiefrain; while his poem could serve as a counterpoise to another also received—the celebrated verses of Hārīth’s contemporary Ṭarafa, chief of the Taghlib, the rival brethren of the Bakr. ‘Amr praises the Taghlib in glowing terms: Hārīth, in a similar vein, extolls the Bakr—ancestors of Ḥammād’s patrons. The collection of Ḥammād appears to have consisted of the same seven poems which are found in our modern editions, composed respectively by Amra-al-Qais, Ṭarafa, Zuhair, Labīd, ‘Antara ibn Shaddād, ‘Amr ibn Kulthum, and Hārīth ibn Ḥijlīza. These are enumerated both by Ibn ‘Abd-Rabbīhi, and, on the authority of the older philologists, by Naḥḥās; and all subsequent commentators seem to follow them. We have, however, evidence of the existence, at a very early period, of a slightly different arrangement. Certainly we cannot now say, on the testimony of the Jamhurat as-sā’il ar’āb, that two of the most competent ancient authorities on Arabic poetry, Mofajdād (d. c. 970) and Abd ‘Abd al-Mu‘alī (d. a.d. 924, at a great age), had already assigned to the “Seven” (viz. “the seven Mo‘allakat”) a poem each of Naḥḥās and Aṣḥāb in place of those of ‘Antara and Hārīth. For meanwhile it has been discovered that the compiler of the above-mentioned work—who, in order to deceive the reader, issued it under a false name—is absolutely untrustworthy. But the learned Ibn Qotaila (9th century A.D.), in his book Of Poetry and Poets, mentions as belonging to the “Seven” not only the poem of ‘Amr, which has invariably been reckoned among the Mo‘allakat (ed. de Goeje, p. 120), but also a poem of ‘Abd ibn Abraṣ (ibid. 144). In place of which poem he read this we do not know; and we are equally ignorant as to whether he counted other pieces than those indicated above among the seven.

Now Naḥḥās and Aṣḥāb enjoyed greater celebrity than any of the poets represented in the Mo‘allakat, with the exception of Amra-al-Qais, and it is therefore not surprising that scholars, of a somewhat later date, appended a poem by each of these to the Mo‘allakat, without intending by this to make them an integral part of that work. This is clear, for instance, from the introductory words of Thābit (d. a.d. 1195) to his commentary on the Mo‘allakat. Appended to this he gives a commentary to a poem of Naḥḥās, to one of Aṣḥāb, and moreover one to that poem of ‘Abd which, as we have just seen, Ibn Qotaila had counted among the seven. It is a pure misunderstanding when Ibn Khaldūn (loc. cit.) speaks of nine Mo‘allakat; and we ought hardly to lay any stress on the fact that he mentions not only Nābihā and Aṣḥāb, but also ‘Alqama, as Mo‘allakat—poets. He was probably led to this by a delusive recollection of the Collection of the “Six Poets,” in which were included these three, together with the three Mo‘allakat-poets, Amra-al-Qais, Zuhair and Ṭarafa.

The lives of these poets were spread over a period of more than a hundred years. The earliest of the seven was Amra-al-Qais (q.v.), regarded by many as the most illustrious of Arabian
poets. His exact date cannot be determined; but probably the best part of his career fell within the midst of the 6th century. He was a scion of the royal house of the tribe Kinda, which lost its power at the death of King Ḥarith ibn 'Amr in the year 529. The poet's royal father, Ḥojr, by some accounts a son of this Ḥarith, was killed by a Bedouin tribe, the Banū Asad. The son led an adventurous life as a refugee, now with one tribe and now with another, and appears to have died young. The anecdotes related of him—which, however, are very untrustworthy in detail—as well as his poems, imply that the glorious memory of his house and the hatred it inspired were still comparatively fresh, and therefore recent. A contemporary of Amra' al-Qais was 'Abid ibn Abraš, one poem of whose, as we have seen, is by some authorities reckoned among the collection. He belonged to the Banū Asad, and is fond of vaunting the heroic death of his tribe—the murder of Ḥojr—in opposition to the victim's son, the great poet.

The Mo'allaqa of 'Amr hurl defiance against the king of Ḥira, 'Amr son of Mundhir, who reigned from the summer of 554 till 568 or 569, and was afterwards slain by our poet.5 This prince is also addressed by Ḡārīth in his Mo'allaqa. Of Ṭarafa, who is said to have attained no great age, a few satirical verses have been preserved, directed against this same king. This agrees with the fact that a grandson of the Qais ibn Khālid, mentioned as a rich and influential man in Ṭarafa's Mo'allaqa (v. 8o or 81), figured at the time of the battle of Dhū-Qu'Rā, in which the tribe Bakr routed a Persian army. This battle falls between A.D. 604 and 610.6

The Mo'allaqa of Ṭarafa and that of Ḥuzair contain allusions to the feuds of the kindred tribes 'Abs and Dhobydān. Famous as these contests were, their time cannot accurately be dated from other data. Ka'b, son of Ḥuzair, composed first a satire, and then, in the year 630, a eulogy on the Prophet; another son, Bujair, had begun, somewhat sooner, to celebrate Mahomet. Ṭarafa killed the grandfather of Ḥajnaq ibn Qais, who died at an advanced age in A.D. 686 or 687; he outlived 'Abdallāh ibn Simma, whose brother Duraíd was a very old man when he fell in battle against the Prophet (early in A.D. 630); and he had communications with Ward, whose son, the poet Ḥurwā, may perhaps have survived the death of Mahomet to Ṭarafa. From all these indications we may place the productive period of both poets in the end of the 6th century. The historical background of Ṭarafa's Mo'allaqa lies somewhat earlier than that of Ḥuzair's.

To the same period appears to belong the poem of 'Aļqama, which, as we have seen, Ibn Khālidūn reckons amongst the Mo'allaqāt. This too is certainly the date of Naḥīgah, who was one of the most distinguished of Arabic poets. For in the poem often reckoned as a Mo'allaqa, as in many others, he addresses himself to Ṣūmān, king of Ḥira, who reigned in the two last decades of the 6th century. The same king is mentioned as a contemporary in one of 'Alqama's poems.

The poem of Ashā, sometimes added to the Mo'allaqāt, contains an allusion to the battle of Dhū-Qu'Rā (under the name "Battle of Ḥijr," v. 62). This poet, not less famous than Naḥīgha, lived to compose a poem in honour of Mahomet, and died not long before A.D. 650.

Lažb is the only one of these poets who embraced Islam. His Mo'allaqa, however, like almost all his other poetical works, belongs to the Pagan period. He is said to have lived till 661, or even later; certainly it is true of him, what is asserted with less likelihood of several others of these poets, that he lived to a ripe old age.

The seven Mo'allaqāt, and also the poems appended to them, represent almost every type of ancient Arabian poetry in its excellences and its weaknesses. In order rightly to appreciate these, we must translate ourselves into the world of the Bedouin, and seek to realize the peculiar conditions of his life, together with the views and thoughts resulting from those conditions. In the Mo'allaqa of Ṭarafa we are repelled by the long, anatomically exact description of his camel; but such a description had an extraordinary charm of its own for the Bedouins, every man of whom was a perfect connoisseur on this subject down to the minutest points; and the remaining parts of the poem, together with the other extant fragments of his poem, show that Ṭarafa had a real poetical gift. In the Mo'allaqāt of 'Amr and Ḥarith, for the preservation of which we are especially grateful to the compiler, we can read the haughty spirit of the powerful chieftains, boastfully celebrating the splendours of their tribe. These two poems have also a certain historical importance. The song of Ḥuzair contains the practical wisdom of a sober man of the world. The other poems are fairly typical examples of the customary qaṣīda, the long poem of ancient Arabia, and bring before us the various phases of Bedouin life. But even here we have differences. In the Mo'allaqa of Ṭarafa, whose heroic temperament had overcome the scorn with which the son of a black slave-mother was regarded by the Bedouins, there predominates a warlike spirit, which plays practically no part in the song of Lažb.

It is a phenomenon which deserves the fullest recognition, that a people so backward and so primitive as a portion of a barren country should thus have produced an artistic poetry distinguished by so high a degree of uniformity. Even the extraordinary strict metrical system, observed by poets who had no inkling of theory and no knowledge of an alphabet, excites surprise. In the most ancient poems the metrical form is as scrupulously regarded as in later compositions. The only poem which shows unusual metrical freedom is the above-mentioned song of 'Abīd. It is, however, remarkable that 'Abīd's contemporary Amra' al-Qais, in a poem which in other respects also exhibits certain coincidences with that of 'Abīd (No. 55, ed. Aḥlāwīd), presents himself considerably licent in the use of the very same metre—one which, moreover, is extremely rare in the ancient period. Presumably, the violent deviations from the schema in 'Abīd are due simply to incorrect transmission by compilers who failed to grasp the metre. The other poems ascribed to 'Abīd, together with all the rest attributed to Amra' al-Qais, are constructed in precise accordance with the metrical canons. It is necessary always to bear in mind that these ancient poems, which for a century or more were preserved by oral tradition alone, have reached us in a much mutilated condition. Fortunately, there was a class of men who made it their special business to learn by rote the works either of a single poet or of several. The poets themselves used the services of these rhapsodists (rāwī). The last representative of this class is Ḥammād, to whom is attributed the collection of the Mo'allaqāt; but he, at the same time, marks the transition of the rhapsodist to the critic and scholar. The most favourable opinion of these rhapsodists would require us to make allowance for occasional mistakes: expressions would be transposed, the order of verses disarranged, passages omitted, and probably portions of different poems pieced together. It is clear, however, that Ḥammād dealt in the most arbitrary fashion with the enormous quantity of poetry which he professed to know thoroughly. The seven Mo'allaqāt are indeed free from the suspicion of forgery, but even in them the text is frequently altered and many verses are transposed. The loose structure of Arabic poems was extremely favourable to such alterations. Some of the Mo'allaqāt have several preambles: so, especially, that of Ṭarafa, the first eight verses of which belong not to the poem, but to another poet. Elsewhere, also, we find spurious verses in the Mo'allaqāt. Some of these poems, which have been handed down to us in other exemplars besides the collection itself, exhibit great divergences both in the order and number of the verses and in textual details. This is particularly the case with the oldest Mo'allaqa—that of Amra' al-Qais—the critical treatment of which is a problem of such extreme difficulty that only an approximate solution can ever be reached. The variations of the text, outside the Mo'allaqāt collection, have

2 See Nöldeke's Tabari, pp. 170,172.
3 Ibid. p. 311.
here and there exercised an influence on the text of that collection. It would be well if our manuscripts at least gave the Mo'allaqa in the exact form of Hammad's days. The best text—in fact, we may say, a really good text—is that of the latest Mo'allaqa, the song of Labid.

The Mo'allaqa exist in many manuscripts, some with old commentaries, of which a few are valuable. They have also been several times printed. Special mention is due to the edition of Charles (afterwards Sir) Charles Lyall with the commentary of Tibrit (Calcutta 1894). Attempts to translate these poetic verses, in poetic form, could scarcely have a happy result. The strangeness, both of the expression and of the subjects, only admits of a paraphrastic version for large portions, unless the same is to be entirely obliterated. An attempt at such a translation, in conjunction with a commentary based on the principles of modern science, has been made by the present author: *Fünf Mo'allaqat ersetzt und erklart,* in the Zeitschrift der kaiserl. Akadem. Wiss. in Wien. Philos.-hist. Classe. Bde. exx-cxiv. A supplement to this is formed by an article, by Dr Bernh. Geiger, on the Mo'allaqa of Tarafa, in the Wiener Zeitschrift für die Kunde des Morgenlandes, s. 323 sqq. See further the separate articles on the seven poets. (TH. N.)

**MOAT,—MOBILE.**

A ditch filled with water surrounding a castle, town or other fortified place for purposes of defence. The word is taken from the O. Fr. mor, mot, or motte, a mound or embankment of earth used as a means of defence; the transition in meaning from the heap of earth to the trench left by excavating the earth is parallel with the similar interchange of meaning in ditch and dike (see DIKE). In mod. Fr. motte means a lump or clod of earth. The word is probably of Teutonic origin, and may be connected with Eng. "mud." (See FORTIFICATION and SIEGECRAFT.)

MOB. (1) A disorderly crowd, a rabble, also a contemptuous name for the common people, the lower orders, the Greek ِξηκος (whence "ochlocracy," "mob-rule.") The word is a shortened form of Lat. *mobile* (sc. *vulgaris*), the movable or mutable emotional, easily stirred crowd. "Mobile" in the sense of rabble was used in the 17th century, and was still used after the shortened form, for some time considered a vulgarism, had become common. Thus Addison (Speculator, No. 135) writes, "It is perhaps this humour of speaking no more than we needs must which has so miserably curtailed some of our words. . . . I dare not answer that 'mob' . . . 'inco' and the like will not in time be looked at as part of our tongue." Roger North's *Examen,* vii., 574 (1740), dates the beginning of the use of the shortened form "mob." "I may note that the rabble first changed their title and were called the 'mob' in the assemblies of this club. It was their beast of burden, and called first *mobile vulgaris,* but fell naturally into the contraction of one syllable, and ever since is become proper English." The club alluded to is the Green Ribbon Club (q.v.), and the date would be about 1680. (2) A kind of head-dress for women, usually called a "mob cap," worn during the 18th and early part of the 19th centuries. It was a large cap covering all the hair, with a bag-shaped crown, a broad band and frilled edge. It seems to have been originally an article of wear for the mornings. It is probably connected with words such as "mop," "mab," meaning untidy, *nëgëtë.*

MOBERLY, GEORGE (1803-1885), English divine, was born on the 10th of October 1803, and educated at Winchester and Balliol. After a distinguished academic career he became head master of Winchester in 1835. This post he resigned in 1866, and retired to Brightstone Rectory, Isle of Wight. Mr. Gladstone, however, in 1869 called him to be bishop of Salisbury, in which see he kept up the traditions of his predecessors, Bishops Hamilton and Denison, his chief addition being the summoning of a diocesan synod. Though Moberly left Oxford at the beginning of the Oxford movement, he fell under its influence: the more so that at Winchester he formed a most intimate friendship with Këble, spending several weeks every year at Otterbourne, the next parish to Hursley. Moberly, however, retained his independence of thought, and in 1872 he astonished his High Church friends by joining in the movement for the disuse of the damnable clauses in the Arianese Creed. His chief contribution to theology is his Bampton Lectures of 1868, on The Administration of the Holy Spirit in the Body of Christ. He died on the 6th of July 1885.

MOBERLY, ROBERT CAMPBELL (1845-1902), English theologian, was born on the 26th of July 1845. He was the son of George Moberly, bishop of Salisbury, and faithfully maintained the traditions of his father's teaching. Educated at Winchester and New College, Oxford, he was appointed senior student of Christ Church in 1867 and tutor in 1869. In 1876 he went out with Bishop Copleston to Ceylon for six months. After his return he became the first head of St Stephen's House, Oxford (1876-1878), and then, after presiding for two years over the Theological College at Salisbury, where he acted as his father's chaplain, he accepted the college living of Great Budworth in Cheshire in 1880, and the same year married Alice, the daughter of his father's predecessor, Walter Kerr Hamilton. In 1892 Lord Salisbury made him Regius Professor of Pastoral Theology of Oxford; and after a long personal struggle with health he died at Christ Church on the 8th of June 1903. His chief writings were: An essay in *Lux Mundi* on "The Incarnation as the Basis of Dogma" (1880); a paper, *Belief in a Personal God* (1881); *Reason and Religion* (1886), a protest against the limitation of the reason to the understanding; *Ministerial Priesthood* (1897); and *Atonement and Personality* (1901). In this last work, by which he is chiefly known, he aimed at presenting an explanation and a vindication of the doctrine of the Atonement by the help of the conception of personality. Rejecting the retributive view of punishment, he describes the sufferings of Christ as those of the perfect "Penitent," and finds their expiatory value to lie in the Person of the Sufferer, the God-Man.

MOBERLY, a city of Randolph county, Missouri, U.S.A., in the north central part of the state, about 130 m. e. N. of Kansas City. Pop. (1890), 811; (1900), 802, (923 negroes); (1910), 1,092. It is served by the Missouri, Kansas & Texas and the Wabash railways, and is a division head of the latter. The city is regularly laid out on a level prairie site. There are two public parks, a Carnegie library, a commercial college, a Y.M.C.A. building, and a hospital maintained by the Wabash Employees Hospital Association. The most important industrial establishments are the large machine shops (established here in 1872) of the Wabash railway. Moberly was platted in 1866, was incorporated as a town and became the county-seat in 1868, and in 1873 secured a special city charter, which it surrendered in 1889 for city status under the general statute.

MOBILE, a city and the county-seat of Mobile county, Alabama, U.S.A., in the S.W. part of the state, at the mouth of Mobile River, and the head of Mobile Bay. Pop. (1890), 31,076; (1900), 38,466, of whom 27,045 were negroes and 2171 foreign-born (362 German, 492 Irish, 202 English); (1900 census), 51,521. It is served by the Southern, the Louisville & Nashville, the Mobile & Ohio, the Mobile, Jackson & Kansas City, and the Tombigbee Valley railways; by steamboat lines to ports in Europe, Cuba, Mexico, Central America (especially Panama) and South America; by a coastwise steamboat line to New York; and by river boats on a river system embracing nearly 2000 m. of navigable waters in Alabama, Mississippi, and Georgia. The city occupies about 17 sq. m. of a sandy plain, which rises gradually from a low water front along the river to a range of hills a few miles to the westward. Among the principal buildings are the customs-house and post-office, the court-house, the Battle House (a hotel), the United States marine hospital, the city hospital, the Providence infirmary, Barton Academy (a part of the public school system), a Young Men's Christian Association building, St Joseph's church (Roman Catholic), the cathedral of the Immaculate Conception, the Van Antwerp office building, and the southern market and armoury. Mobile is the see of a Roman Catholic bishopric and the headquarters of the United States district court for the southern district of Alabama. In the city are a public library; the departments of medicine and pharmacy of the university of Alabama; the academy of the Visitation, and the
Immaculate Conception school, both for girls and both Roman Catholic; the Convent of Mercy; the Emerson normal and industrial school (for negroes), McGill Institute, the University military school, and the Mobile military institute; and 5 m. from Mobile, at Spring Hill, is Spring Hill college (Roman Catholic, founded in 1830, chartered 1836), controlled by the Jesuits. There is an annual celebration in Mobile on Mardi Gras (Shrove Tuesday), conducted by the Order of Myths and the Mystics, two social organizations, successors of the Cowbell de Rakin Society, which was organized in 1830 and long conducted a somewhat similar celebration annually, on New Year’s Eve.

Mobile is the only seaport of Alabama. In 1826 the channel from it to the Gulf, about 30 m. distant, had a minimum depth of only 11 ft. through Choctaw Pass and 8 ft. through Dog River bar; but subsequently the channel has been greatly improved by the United States government, and in June 1901 vessels drawing 23 and 24 ft. could pass at low-water to the mouth of Chicksaw Creek above the city. While the channel was still shallow, and rapidly growing railways were serving other ports, much foreign commerce was lost to Mobile, the value of the exports falling off from $12,784,171 in 1877 to $3,258,606 in 1882, and the value of the imports, during the same period, from $408,404 to $396,573; but after the improvement of the channel the value of the exports increased from $5,140,502 in 1897 to $26,815,279 in 1906, and the value of the imports rose from $950,712 in 1897 to $4,242,169 in 1908. The foreign commerce consists largely in the export of cotton, lumber, timber, cottonseed oil, coal, provisions and clothing, and in the import of tropical fruits (especially bananas), sisal grass, coffee, mahogany, asphalt, and manganese and sulphur ores. Vegetables, particularly beans and cabbage, and small fruits are grown extensively in the vicinity, and the city has an important domestic trade in market-garden produce, fish and oysters, hardware, dry goods, grain and groceries. In manufacturing Mobile was second (Birmingham being first) among the cities of the state in 1905, when the value of the factory product was $1,042,331, 41.8% more than in 1900. In 1905 it ranked first in the state in the value of fertilizer, lumber and timber, and in the construction of railway cars; and the manufacture of flour and gist mill products and machinery for flour mills were important industries.

Founded by Pierre Lemoyne, Sieur d'Iberville (1661-1700), and his brother Jean Baptiste Lemoyne, Sieur de Bienville (1680-1706), in 1702, Mobile was the capital of the French province of Louisiana until 1720, when the seat of government was transferred to Biloxi, in the present Mississippi. The original settlement was at Twenty-seven Mile Bluff, about 20 m. above the present site, to which it was removed in 1710 as a consequence of floods in 1709. By the Treaty of Paris (1763) Mobile, as a part of Louisiana east of the Mississippi, was ceded to Great Britain; but on the 14th of March 1780 it was captured by a Spanish force under Don Bernado Galland, and the city was occupied by a Spanish governor at New Orleans, and Spain was confirmed in its possession by the treaty of 1783. Spanish civil institutions were introduced, and new names, such as Conception, St Emanuel and St Joseph, which still survive, were given to the streets. Yet neither the English nor the Spanish occupation made any substantial change in the tone of the place or the habits of its people, even the negroes holding to their French jargon. The alliance between Great Britain and Spain, at the outbreak of the war of 1812, gave Mobile strategic importance for the military operations in the south-west. Hence, on the 15th of April 1813 General James Wilkinson, acting on President James Madison's instructions, which were based on the claim that Mobile was a part of Louisiana sold by France to the United States in 1803, seized Mobile for the United States. 1

1 Between 1826 and 1908 the Federal government expended $5,142,179 on the improvement of the harbour. The bar channel also has been improved.

2 The city was named from the Mobile or Maubila Indians, a Muskogean tribe, now extinct, who occupied the neighbouring region and were Christianized by the French.

In August 1814 General Andrew Jackson made Mobile his headquarters. He repaired Fort Bowyer, on Mobile Point at the mouth of the bay, and garrisoned it just in time for it to resist attack by the British on the 15th of September. On the 11th of February 1815, forty-two days after peace had been declared and thirty-four days after the battle of New Orleans, a British force captured Fort Bowyer; but it made no move against Mobile, and withdrew on the 1st of April. Now began the Americanization of Mobile, a tide of immigration from the up-country setting in and rapidly changing the character of the place, which had previously been distinctly French. A town charter had been granted by the territorial legislature of Mississippi on the 20th of January 1814, and an interesting feature under the town government was the "tariff for bakers," which fixed the weight of loaves of bread in accordance with the price of flour. A city charter, dated the 17th of December 1819, was granted by the first state legislature of Alabama, and Mobile became the commercial emporium for Alabama and Mississippi, its cotton exports increasing from 7,000 bales in 1818 to 100,000 in 1830 and 450,000 in 1840. In 1826 Barton Academy, still one of the landmarks of the city, was built; but it was not until 1852 that common schools were opened in Mobile county. Branches of the United States Bank and of the State bank were established at Mobile, and in the panic of 1837 the Bank of Mobile was one of the few banks in the United States that did not suspend payment. The Mobile & Ohio railroad, begun in 1848, provided ampler communication with the Mississippi valley, and Mobile's export of cotton rose to 1,000,000 bales in 1861.

During the Civil War Mobile was an important seaport of the Confederacy. A Federal blockade was begun as early as the 26th of May 1861, but trade with West Indian and European ports was not practically stopped until the city was lost, April 8, 1862, which practically等于 the blockading squadron. On the 5th of August 1864 Admiral David G. Farragut (e.v.), with a Federal fleet of four iron monitors, seven wooden sloops of war, and several gunboats, entered the channel by passing the Confederate defences, Fort Gaines on Dauphin Island and Fort Morgan occupying the site of old Fort Bowyer on Mobile Point, captured the formidable Confederate ironclad ram "Tennessee," destroyed one gunboat and drove another aground. One of the Federal monitors, the "Tecumseh," was destroyed by torpedoes. The Confederate fleet was commanded by Admiral Franklin Buchanan (1800-1874). Fort Gaines surrendered on the 7th, and Fort Morgan on the 23rd of the same month. In the spring of 1865 General E. R. S. Canby (1819-1873), with a Federal force of about 45,000, laid siege to Fort Blakely and Spanish Fort, on the east side of the bay (opposite the city), defended by General Randall L. Gibson (1852-1892) with 3000 men. After twenty-five days of resistance the Confederates evacuated the fortifications and then the city, the Federals entering on the 12th of April 1865. Losses from railway enterprises and the panic of 1873 resulted in the bankruptcy of the municipality in 1879, whereupon its charter was vacated, its property vested in certain trustees acting under the Chancellor Court to adjust its debt, and a municipal government under the name of Port of Mobile succeeded the city of Mobile until 1887, when the latter was again chartered. On the 27th of September 1906 Mobile was swept by a hurricane, which destroyed property valued at $5,000,000 or more.

See Peter J. Hamilton, Colonial Mobile (Boston, 1897); and a chapter by the same writer in L. P. Powell's Historic Towns of the Southern States (New York, 1900).

MÖBIUS, AUGUST FERDINAND (1790-1868), German astronomer and mathematician, was born at Schulpforta on the 17th of November 1790. At Leipzig, Göttingen and Halle he studied for four years, ultimately devoting himself to mathematics and astronomy. In 1815 he settled at Leipzig as privat-doent, and the next year became extraordinary professor of astronomy in connexion with the university. Later he was chosen director of the university observatory, which was erected (1818-1821) under his superintendence. In 1844 he was elected ordinary professor of higher mechanics and astronomy, a position
which he held till his death on the 26th of September 1868. His doctor's dissertation, De comitantibus occultationibus fixarum per planetas (Leipzig, 1813), established his reputation as a theoretical astronomer. He became Professor of Natural History and Astronomer at the University of Leipzig (1836), Die Elemente der Mechanik des Himmels (1843), may be noted amongst his other purely astronomical publications. Of more general interest, however, are his labours in pure mathematics, which appear for the most part in Crell's Journal from 1828 to 1838. These papers are chiefly geometrical, many of them being developments and applications of the methods laid down in his great work, Der barycentrische Calcul (Leipzig, 1827), which, as the name implies, is based upon the properties of the mean point or centre of mass (see Algebra: Universal). This work abounds in suggestions and foreshadings of some of the most striking discoveries in more recent times—such, for example, as are contained in H. Grassmann's Ausdehnungslehre and Sir W. R. Hamilton's Quaternions. Möbius must be regarded as one of the leaders in the introduction of the powerful methods of modern projective geometry.

His Gesammelten Werke have been published in four volumes at Leipzig (1886-1891).

MOCCA, FREDERICK DAVID (1828-1900), English Jewish philanthropist, was a member of the London financial firm, Mocatta and Goldsmid, but retired from business in 1874 and devoted himself to works of public and private benevolence. Besides this he was a patron of learning and himself an author of historical works, the chief of which was The Jews and the Inquisition. On occasion of his 70th birthday, he was presented with a testimonial from more than 200 philanthropic and literary institutions. The Anglo-Jewish Historical Exhibition (1887) owed its inception to him. He bequeathed his fine library to the Jewish Historical Society of England, of which he was at one time president. This library formed the basis of the collections which are now included in the Mocatta Library and Museum, founded in his memory, and located at the University of London (University College, Gower Street).

MOCCASIN (a North-American Indian word, of which the spelling and pronunciation vary in different dialects), a shoe made of deerskin or other soft leather. It is made in one piece; the sole is soft and flexible and the upper part is often adorned with embroidery, beading or other ornament. It is the footwear of the North American Indian tribes and is also worn by hunters, traders and settlers. In botany, the lady's slipper is known in the United States of America, as the "moccasin flower," from its resemblance to a shoe or moccasin. The name moccasin is also given to a venomous snake, found as far north as North Carolina and westward to the Rocky Mountains, and popularly called "cottonmouth," from the white rim around the mouth. It belongs to the family Crotalidae, species Anconodon (or Cenchis) piscivorus, is about two feet long, and is often found in marshy land. It is sometimes called the water moccasin to distinguish it from the upland moccasin (Anconodon contortorius) or aga, which is commonly called "coonsnake" and is found further north in dry and mountainous regions. The name is possibly a distinct word of the origin has not been traced.

MOCENIGO, the name of a noble and ancient Venetian family which gave many dukes, statesmen and soldiers to the republic. TOMMASO MOCENIGO (1343-1423) commanded the crusading fleet in the expedition to Nicopolis in 1396, and also won battles against the Genoese. While he was Venetian ambassador at Cremona he was elected doge (1414), and he escaped in secret, fearing that he might be held a prisoner by Gabrino Fondolo, tyrant of that city. He made peace with the Turkish sultan, but when hostilities broke out afresh his fleet defeated that of the Turks at Gallipoli. During his reign the patriarch of Aquileia was forced to cede his territories to the republic (1420), which also acquired Friuli and Dalmatia. Tommaso greatly encouraged commerce, reconstructed the ducale palace and commenced the library. PIETRO MOCENIGO, doge from 1474 to 1476, was one of the greatest Venetian admirals, and revived the fortunes of his country's navy, which had fallen very low after the defeat at Negropont in 1475. In 1472 he captured and destroyed Smyrna; the following year he placed Catherine Cornaro, queen of Cyprus, under Venetian protection, and by that means the republic obtained possession of the island in 1475. He then defeated the Turks who were besieging Scutari, but he there contracted an illness of which he died. GIOVANNI MOCENIGO, Pietro's brother, who was doge from 1478 to 1485, fought against Mohammed II. and Ercole I., duke of Ferrara, from whom he recaptured Rovigo and the Polarine. LUIGI MOCENIGO was doge from 1570 to 1577. During his reign Venice lost the fortresses Nicosia and Famagusta in Cyprus. He took part in the battle of Lepanto, but after the loss of Cyprus he was forced to make peace with the Turks and to hand them back his conquests. ANDREA MOCENIGO, who flourished in the 15th and 16th centuries, was a senator of the republic and a historian; he composed a work on the league of Cambrai entitled Belli memorabilis Cameracensis adversus Venetos historiae libri vi (Venice, 1513). Another Luigi Mocenigo was doge from 1790 to 1799, and his brother SEBASTIANO from 1722 to 1733. ALVIBRE MOCENIGO (1701-1778), who was doge from 1763 until his death, restricted the privileges of the clergy, and in consequence came into bitter conflict with Pope Clement XIII.

MOCHA STONE, a name applied to chalcedony with dendritic markings, said to have been obtained originally from Mocha in Arabia. The markings which sometimes simulate with curious fidelity the form of miniature trees and shrubs, are caused by the infiltration of solutions carrying iron and manganese, which are deposited as thin films of oxide along the cracks of the stone, producing black, brown or red dendrites, effectively disposed on a ground of grey or white chalcedony. Most of the Mocha stones of commerce are obtained from India, where they are found among the agate-pebbles resulting from the disintegration of the trap rocks of the Deccan. In recent years the formation of dendrites has been artificially effected at the agate works of Oberstein, so as to imitate the true Mocha stones.

MOCK, an adjective meaning sham, feigned, spurious, falsely imitative. As a verb it means to deride or imitate contemptuously. The derivation of O. Fr. mocour, mod. moquer; Ital. moccare, from which the English word is adopted, is disputed. Some authorities refer it to Ger. mucken, muckern, to growl, grumble, which is probably echoic in origin; others to a supposed Late Lat. mucare, formed from mucus—mucus, in the sense of "to wipe the nose at."

MOCK-BIRD, OR MOCK-BIRD (as W. Charleton, J. Ray and M. Catesby called it), the popular name of birds belonging to the American sub-family Miminae of the thrushes, Turdidae, differing by having the tarsus scutellate in front, while the typical thrushes have it covered by a single horny plate. Mimus polyglottus, the northern mocking-bird, inhabits the southern part of the United States, being in the north only a summer visitant; it breeds rarely in New England, is seldom found north of the 38th parallel, and migrates to the south in winter, passing that season in the Gulf States and Mexico. It appears to be less common on the coast than it is inland, and is a bird of the Alleghanies, though found in suitable localities across the continent. It is not, however, very common, and is seldom farther north than Virginia and southern Illinois, and it is said to be common in Kansas. J. J. Audubon states that the mocking-birds which are resident all the year round in Louisiana attack their travelled brethren on the return of the latter from the north in autumn. The names of the species, both English and scientific, have been bestowed from its capacity of successfully imitating the cry of many other birds, to say nothing of other sounds, in addition to uttering notes of its own which possess a varied range and liquid fullness of tone that are unequalled, according to its admirers, even by those of the nightingale (g.v.).

Plain in plumage, being greyish brown above and dull white below, while its quills are dingy white, variegated with white, there is little about the mocking-bird's appearance beyond its graceful form to recommend it; but the lively gesticulations it exhibits are very attractive, and therein its European rival in melody is far surpassed, for the cock-bird mounts aloft in rapid
circling flight, and, alighting on a conspicuous perch, pours forth his ever-changing song to the delight of all listeners; while his actions in attendance on his mate are playfully demonstrative and equally interest the observer. The mocking-bird is more, or of familiar habits, haunting the neighbourhood of houses, and is therefore a general favourite. The nest is placed with little regard to concealment, and is not distinguished by much care in its construction. The eggs, from three to six in number, are of a pale bluish-green, blotched and spotted with light yellowish-brown. They, as well as the young, are much sought after by snakes, but the parents are often successful in repelling these deadly enemies, and are always ready to wage war against any intruder on their precints, be it man, cat or hawk. Their food is various, consisting of berries, seeds and insects.

Some twelve or fourteen other species of Mimus have been recognized, mostly from South America; but M. orphicus seems to be common to some of the Greater Antilles, and M. hilla is peculiar to Jamaica, while the Bahama's have a local race in M. bahamensis. The so-called mountain mocking-bird (Oreoscoptes montanus) is a form not very distant from Mimus; but it inhabits exclusively the plains overgrown with sage-brush (Artemisia) of the interior table-land of North America, and is not at all imitative in its notes, so that it is an instance of a mimic. Of the various other genera allied to Mimus, the best known are the thrashers (genus Harpocornus) of which six or eight species are found in North America, which are mostly dull brown and greyish, and the cat-bird (Geoscoptes carolinensis), which in addition to having an attractive song, utters clucks, whistles and mewing sounds. The sooty-grey colour that, deepening to blackish-brown on the crown and wings, and the white underparts—thick covert, which are of a deep chestnut, excepted—renders it a conspicuous object; and though, for some reason or other, far from being a favourite, it is always willing when undisturbed to become intimate with the visitor's abodes. It has a much wider range on the American continent than the mocking-bird, and is one of the few species that are resident in Bermuda, while on more than one occasion it is said to have appeared in Europe. The name mountain mocking is, in England occasionally given to some of the warblers (g.e.), especially the blackcap (Sylvia atricapilla), and the sedge-bird (Acrocephalus schoenobaenus). In India and Australia the same name is sometimes applied to other species. (A. N.)

MODEL (O. Fr. modelle, mod. modéle; It. modello, pattern, mould; from Lat. modus, measure, standard), a tangible representation, whether the size be equal, or greater, or smaller, of an object which is either in actual existence, or has to be constructed in fact or in thought. More generally it denotes a thing, whether actually existing or only mentally conceived of, whose properties are to be copied. In foundries, the object of which a cast is to be taken, whether it be for engineering or artistic purposes, is usually first formed of some easily workable material, generally wood. The form of this model is then reproduced in clay or plaster, and into the mould thus obtained the molten metal is poured. The sculptor first makes a model of the object he wishes to chisel in some plastic material such as wax, ingenious and complicated contrivances being employed to transfer this wax model, true to nature, to the stone in which the final work is to be executed. In anatomy and physiology, models are specially employed as aids in teaching and study, and the method of moulding or psychromorphic yields excellent impressions of living and dead members, and enables anatomists and physiologists to copy both in form and colour. A special method is also in use for making plastic models of microscopic and minute microscopic objects. That their internal nature and structure may be more readily studied, these are divided by numerous parallel transverse cuts, by means of a microtome, into exceedingly thin sections. Each of these shavings is then modelled on an enlarged scale in wax or pulp plates, which are fixed together to form a reproduction of the object.

Models in the mathematical, physical and mechanical sciences are of the greatest importance. Long ago philosophy perceived the essence of our process of thought to lie in the fact that we attach to the various real objects around us particular physical attributes—our concepts—and by means of these try to represent the objects to our minds. Such views were formerly regarded by mathematicians and physicists as nothing more than idle speculations, but in more recent times they have been brought by J. C. Maxwell, H. v. Helmholtz, E. Mach, H. Hertz and many others into intimate relation with the whole body of mathematical and physical theory. On this view our thoughts stand to things in the same relation as models to the objects they represent. The essence of the process is the attachment of one concept having a definite content to each thing, but without implying complete similarity between thing and thought; for naturally we can know but little of the resemblance of our thoughts to the things to which we attach them. What resemblance there is lies principally in the nature of the connexion, the correlation being analogous to that which obtains between thought and language, language and writing, the notes on the stave and musical sounds, &c. Here, of course, the symbolization of the thing is the important point, though, where feasible, the utmost possible correspondence is sought between the two—the musical scale, for example, being imitated by placing the notes higher or lower. When, therefore, we endeavour to assist our conceptions of space by figures, by the methods of descriptive geometry, and by various thread and object models; our topography by plans, charts and globes; and our mechanical and physical ideas by kinematic models, we may properly expect the ideas to be intelligible by means of which we comprehend objects in thought and represent them in language or writing. In precisely the same way the microscope or telescope forms a continuation and multiplication of the lenses of the eye; and the notebook represents an external expansion of the same process which the memory brings about by purely internal means. There is also an obvious parallelism with representation by means of models when we express longitude, mileage, temperature, &c., by numbers, which should be looked upon as arithmetical analogies. Of a kindred character is the representation of distances by straight lines, of the course of events in time by curves, &c. Still, neither in this case nor in that of maps, charts, musical notes, figures, &c., can we legitimately speak of models, for these always involve a concrete spatial analogy in three dimensions.

So long as the volume of matter to be dealt with in science was insignificant, the need for the employment of models was naturally less imperative; indeed, there are self-evident advantages in comprehending things without resort to complicated models, which are difficult to make, and cannot be altered and adapted to extremely varied conditions so readily as can the easily adjusted symbols of thought, conception and calculation. Yet as the facts of science increased in number, the greatest economy of effort had to be observed in comprehending them and in conveying them to others; and the firm establishment of ocular demonstration was inevitable in view of its enormous superiority over purely abstract symbolism for the rapid and complete exhibition of complicated relations. At the present time it is desirable, on the one hand, that the power of deducing results from purely abstract premises, without recourse to the aid of tangible models, should be more and more perfected, and on the other that purely abstract conceptions should be helped by objective and comprehensive models in cases where the mass of matter cannot be adequately dealt with directly.

In pure mathematics, especially geometry, models constructed of papier mâché and wax and paper were chiefly employed to present to the senses the precise form of geometrical figures, surfaces and curves. Surfaces of the second order, represented by equations of the second degree between the rectangular co-ordinates of a point, are very simple to classify, and accordingly all their possible forms can easily be shown by a few models, which, however, become somewhat more intricate when lines of curvature, loxodromics and geodesic lines have to appear on their surfaces. On the other hand, the multiplicity of surfaces of the third order is enormous, and to convey their fundamental types it is necessary to employ numerous models of complicated, not to say hazardous, construction. In the case of more intricate surfaces it is sufficient to present those singularities which exhibit variation from the usual type of surface with synclastic or anticlastic curvatures, such as, for example, a sharp edge or point, or
an intersection of the surface with itself; the elucidation of such singularities is of fundamental importance in modern mathematics.

In physical science, again, models that are of unchangeable form are largely employed. For example, the operation of the refraction of light in crystals can be pictured if we imagine a point in the centre of the crystal whence light is dispersed in all directions. The aggregate of the places at which the light arrives at any instant after it has started is called the wave-front. This surface consists of two cups or sheets fitting closely and exactly one inside the other. The two rays into which a single ray is broken are always determined by the points of contact of certain tangent-planes drawn to those sheets. With crystals possessing two axes these wave-surfaces display peculiar singularities in the above sense of the term, in that the inner sheet has four protuberances, whereas the outer has four funnel-like depressions, the lowest point of each depression meeting the highest point of each protuberance. At each of these funnels there is a tangent-plane that touches not in a single point, but in a circle bounding the depression, so that the corresponding ray of light is refracted, not into two rays, but into a whole cone of light—the so-called conical refraction theoretically predicted by Sir W. R. Hamilton and experimentally detected by Humphrey. These conical refractions, which it is difficult to adequately express in language, are self-evident so soon as the wave-surface formed in plaster lies before our eyes. In thermodynamics, again, similar models serve, among other purposes, for the representation of the surfaces which exhibits the relation between the three thermodynamic variables of a body, e.g., between its temperature, pressure and volume. A glance at the model of such a thermodynamic surface enables the behaviour of a particular substance under the most varied conditions to be immediately realized. When the ordinate intersects the surface but once a single phase only of the body is conceivable, but where there is a multiple intersection various phases are possible, which may be liquid or gaseous. On the boundaries between these regions lie the critical phases, where transition occurs from one type of phase into the other. If for one of the elements a quantity which occurs in calorimetry be chosen—for example, entropy—information is also gained about the behaviour of the body when heat is taken in or abstracted.

After the stationary models hitherto considered, come the models of moving systems, such as are used in geometry. To show the origin of geometrical figures from the motion of others—e.g., the origin of surfaces from the motion of lines. These include the thread models, in which threads are drawn tightly between moveable bars, cords, wheels, rollers, &c. In mechanics and engineering an endless variety of working models are employed to convey to the eye the working either of machines as a whole, or of their component and subordinate parts. In theoretical mechanics models are often used to exhibit the physical laws of motion in interesting or special cases—e.g., the motion of a falling body or of a spinning-top, the movement of a pendulum on the rotating earth, the vortical motions of fluids, &c. Akin to these are the models which execute more or less exactly the hypothetical motions by which it is sought to explain various physical phenomena—as, for instance, the complicated wave-machines which present the motion of the particles in waves of sound (now ascertained with fair accuracy), or the more hypothetical motion of the atoms of the aether in waves of light.

The interesting object which in recent times has been attached to forms of this kind is intimately connected with the Theories of the changes which have taken place in our conceptions of nature. The first method by which an attempt was made to solve the problem of the universe was entirely under the influence of Newton's laws. In analogy to his laws of universal gravitation, all bodies were conceived of as consisting of points of matter—atoms or molecules—to which was attributed a direct action at a distance. The circumstances of this action at a distance, however, were conceived as differing from those of the Newtonian law of attrac-

tion, in that they could explain the properties not only of solid elastic bodies, but also those of fluids, both liquids and gases. The phenomena of heat were explained by the motion of minute particles absolutely invisible to the eye, while to explain those of light it was assumed that an impenetrable medium, called luminiferous aether, permeated the whole universe; to this were attributed the same properties as were possessed by solid bodies, and it was also supposed to consist of atoms, although of a much finer composition. To explain electric and magnetic phenomena the assumption was made of a third species of matter—electric fluids which were conceived of as being more of the nature of fluids, but still consisting of infinitesimal particles, also acting directly upon one another at a distance. This first phase of theoretical physics may be called the direct one, in that it took as its principal object the investigation of the internal structure of matter as it actually exists. It is also known as the mechanical theory of nature, in that it seeks to trace back all natural phenomena to motions of infinitesimal particles, i.e. to purely mechanical phenomena. In explaining magnetic and electrical phenomena it inevitably fell into somewhat artificial and improbable hypotheses, and this induced J. Clerk Maxwell, adopting the ideas of Michael Faraday, to propound a theory of electric and magnetic phenomena which was not only new in its general conception, but in its molecular expression. The particles and atoms of the old theory were not to be conceived of as exact mathematical points in the abstract sense, then their true nature and form must be regarded as absolutely unknown, and their groupings and motions, required by theory, looked upon as simply a process having more or less resemblance to the workings of nature, and representing more or less exactly certain aspects incidental to them. With this in mind, Maxwell propounded certain physical theories which were purely mechanical so far as they proceeded from a conception of purely mechanical processes. But he explicitly stated that he did not believe in the existence in nature of mechanical agents so constituted, and that he regarded them merely as means by which phenomena could be reproduced, bearing a certain similarity to those actually existing, and which also served to include larger groups of phenomena in a uniform manner and to determine the relations that held in their case. The question no longer being one of ascertaining the actual internal structure of matter, many mechanical analogies or dynamical illustrations became available, possessing different advantages, and as a matter of fact Maxwell at first employed special and intricate mechanical arrangements, though later these became more general and indefinite. This theory, which is called that of mechanical analogies, leads to the construction of numerous mechanical models. Maxwell himself and his followers devised many kinetic models, designed to afford a representation of the mechanical construction of the ether as a whole as well as of the separate mechanisms at work in it: these resemble the old wave-machines, so far as they represent the movements of a purely hypothetical mechanism. But while it was formerly believed that it was allowable to assume with a great show of probability the actual existence of such mechanisms in nature, yet nowadays philosophers postulate no more than a partial resemblance between the phenomena visible in such mechanisms and those which appear in nature. Here again it is perfectly clear that these models of wood, metal and cardboard are really a continuation and integration of our process of thought; for, according to the view in question, physical theory is merely a mental construction of mechanical models, the working of which we make plain to ourselves by the help of a model we hold in our hands, and which have so much in common with natural phenomena as to help our comprehension of the latter.

Although Maxwell gave up the idea of making a precise investigation into the final structure of matter as it actually is, yet in Germany his work, under G. R. Kirchhoff's lead, was carried still further. Kirchhoff defined his own aim as being to describe, not to explain, the world of phenomena; but as he leaves the means of description open his theory differs little from Maxwell's, so soon as recourse is had to description by
MODELS, ARTISTS'—MODEL-YACHTING

means of mechanical models and analogies. Now the resources of pure mathematics being particularly suited for the exact description of relations of quantity, Kirchhoff's school laid great stress on description by mathematical expressions and formulae, and the aim of physical theory came to be regarded as mainly the construction of formulae by which phenomena in the various branches of physics should be determined with the greatest approximation to the reality. This view of the nature of physical theory is known as mathematical phenomenology; it is a presentation of phenomena by analogies, though only by such as may be called mathematical.

Another phenomenology in the widest sense of the term, maintained especially by E. Mach, gives less prominence to mathematics, but considers the view that the phenomena of motion are essentially more fundamental than all the others to have been too hastily taken. It rather emphasizes the prime importance of description in the most general terms of the various spheres of phenomena, and holds that in each sphere its own fundamental law and the notions derived from this must be employed. Analogies and elucidations of one sphere by another—e.g. heat, electricity, &c.—by mechanical conceptions, this theory regards as mere ephemeral aids to perception, which are necessitated by historical development, but which in course of time either give place to others or entirely vanish from the domain of science.

All these theories are opposed by one called energetics (in the narrower sense), which looks upon the conception of energy, not that of matter, as the fundamental notion of all scientific investigation. It is in the main based on the similarities energy displays in its various spheres of action, but at the same time it takes its stand upon an interpretation or explanation of natural phenomena by analogies which, however, are not mechanical, but deal with the behaviour of energy in its various modes of manifestation.

A distinction must be observed between the models which have been described and those experimental models which represent on a small scale a machine that is subsequently to be completed on a larger, so as to afford a trial of its capabilities. Here it must be noted that a mere alteration in dimensions is often sufficient to cause a material alteration in the action, since the various capabilities depend in various ways on the linear dimensions. Thus the weight varies as the cube of the linear dimensions, the surface of any single part and the phenomena that depend on such surfaces are proportionate to the square, while other effects—such as friction, expansion and conduction of heat, &c., vary according to other laws. Hence a flying-machine, which when made on a small scale is able to support its own weight, loses its power when its dimensions are increased. The theory, initiated by Sir Isaac Newton, of the dependence of various effects on the linear dimensions, is treated in the article UNITS, DIMENSIONS OF.

Under simple conditions it may often be affirmed that in comparison with a large machine a small one has the same capacity, with respect to its weight or some standard of time which must be diminished in a certain ratio.

Of course experimental models are not only those in which purely mechanical forces are employed, but also include models of thermal, electro-magnetic and other engines—e.g. dynamos and telegraphic machines. The largest collection of such models is to be found in the museum of the Washington Patent Office. Sometimes, again, other than purely mechanical forces are at work in models for purposes of investigation and instruction. It often happens that a series of natural processes—such as motion in liquids, internal friction of gases, and the conduction of heat and electricity in metals—may be expressed by the same differential equations; and it is frequently possible to follow by means of measurements one of the processes in question—e.g. the conduction of electricity just mentioned. If then there be shown in a model a particular case of electrical conduction in which the same conditions at the boundary hold as in a problem of the internal friction of gases, we are able by measuring the electrical conduction in the model to determine at once the numerical data which obtain for the analogous case of internal friction, and which could only be ascertained otherwise by intricate calculations. Intricate calculations, moreover, can very often be dispensed with by the aid of mechanical devices, such as the ingenious calculating machines which perform additions and subtractions and very elaborate multiplications and divisions with surprising speed and accuracy, or apparatus for solving the higher equations, for determining the volume or area of geometrical figures, for carrying out integrations, and for developing a function in a Fourier's series by mechanical means.

MODELS, ARTISTS', the name given to persons who pose as artists for their work. The Greeks, who had the naked body constantly before them in the exercises of the gymnast, had far less need of professional models than the moderns; but it is scarcely likely that they could have attained to the high level reached by their works without constant study from nature; and the story told of Zeuxis by Valerius Maximus, that of the most beautiful virgins of the city of Crotona offered him as models for his picture of Helen, proves their occasional use. The remark of Eupompos, quoted by Pliny, who advised Lysippus, “Let nature be your model, not an artist,” directing his attention to the crowd instead of to his own work, also suggests a use of models which the many portrait statues of Greek and Roman times show to have been not unknown. In Egypt, too, although the priesthood had control of both sculpture and painting as used for the decoration of temples and palaces, and imposed a strict conventionalism, there are several statues of the early periods which are so lifelike in their treatment as to make it certain that they must have been worked from life. At the period of the Renaissance, painters generally made use of their relations and friends as models, of which many examples might be quoted from Venice, Florence, Rome and other places, and the stories of Titian and the duchess of Ferrara, and Botticelli and Simonetta Vespucci, go to show that ladies of exalted rank were sometimes not averse from having their charms immortalized by the painter's brush. But artists' models are not unknown, as the story of the unfortunate contadino used by Sansovino as model for his statue of the little Bacchus will show. Artists' models as a special class appear when the establishment of schools for the study of the human figure created a regular demand, and since that time the remuneration offered has ensured a continual supply. The prices and the hours of work vary in different art centres. In England seven shillings is generally paid for a day of six hours, but models of exceptional beauty or talent frequently obtain more from successful artists or wealthy amateurs.

MODEL-YACHTING, the pastime of building and racing model-yachts. It has always been customary for ship-builders to make a miniature model of the vessel under construction, which is in every respect a copy of the original on a small scale, whether steam-ship or sailing-vehicle (there is a fine collection in the Victoria and Albert Museum, London). Many of these models are of exquisite workmanship, every rope, pulley or portion of the engine being faithfully reproduced. In the case of sailing yachts these models were often pitted against each other on small bodies of water, and hence arose the modern pastime. It was soon seen that elaborate fittings and complicated rigging were a detriment to rapid handling, and that, on account of the comparatively stronger winds in which models were sailed, they needed a greater draught. For these reasons modern model yachts, which usually have fin-keels, are of about 15% or 20% deeper draught than full-sized vessels, while rigging and fittings have been reduced to absolute simplicity. This applies to models built for racing and not to elaborate copies of steamers and ships, made only for show or for "toy cruising."

Model-yacht clubs have existed for many years in Great Britain, Ireland and the United States, most of them holding a number of regattas during each season. The rules do not generally require the owner or skipper of a model to build his own craft, but among model-yachters the designing and the construction of the boat constitutes as important and interesting
a part of the sport as the actual sailing. Models are constructed of some light, seasoned wood—such as pine (preferably white), white cedar or mahogany—free from knots. The hull may either be hollowed out of a solid block of wood, or cut from layers of planks in the so-called “bread-and-butter” style, or planked over a frame of keel and cross-sections. The first two methods are used in constructing “dug-out” models. Hollowing out from the solid block entails a great deal of labour and has therefore fallen into disfavour. In the “bread-and-butter” style a number of planks, which have been shaped to the horizontal sections of the model and from which the middle has been sawn out, are glued together and then cut down to the exact lines of the design, templates being used to test the precision of the curves. In the planked, or “built-up” model, which is generally chosen by more expert builders, the planks are tacked to the frame, as in the construction of large vessels. Models now are generally exaggerated cutters, so far as their underbodies are concerned, or, more often, are fitted with fin-keels weighted with lead, after the manner of full-sized yachts. They may have any rig, but schooner and sloop rigs are most common, the latter being the favourite for racing on account of its simplicity. Two kinds of steering-gear are used, the weighted swinging rudder and the “main-sheet balance gear,” the object of both being to keep the model on a true course, either before or against the wind. Models are often sailed without rudders, but though a perfectly built boat will sail readily against the wind without steering-gear, it is almost impossible to keep it on its course before the wind without some contrivance to check divergence. This is accomplished by the weighted rudder, which falls over when the vessel heels and tends to counteract the force of the breeze. There are two varieties of the weighted rudder, in the first of which the weight, usually lead, is fixed to the edge of the rudder, while in the second the weight, usually a ball of lead, is made to run on the tiller over the deck, so that it can be placed further forward or aft, according to the wind. The manner of steering the boat depends upon the wind and the wish of the owner. While the weighted rudder is almost universal in the British Isles, the chief model-yachtsmen in America use the “main-sheet balance gear,” in which the boom is connected with the tiller in such a manner that, when it swings out with a pressure of wind, the rudder is automatically pulled round sufficiently to keep the yacht in its course. This apparatus is particularly efficient in sailing before the wind.

Model-yacht regattas are very different from the toy-boat matches indulged in by children from one side of a pond to the other. They take place upon sufficiently large bodies of water to allow a course at least a quarter of a mile in length, which is generally sailed twice or three times over to windward and backward. Triangular courses are also sailed. Racing rules correspond generally to those controlling regattas of large boats, and there is full scope to exhibit all the proofs of good seamanship. The yachts are followed in light skiffs, and may not be touched by them except in case of the payment of a sum, which is made by the owner of the yacht when one of his boats falls foul of another, and is generally called a “penalty.” Racing measurements differ in the various clubs, but all are based upon length and sail-area. In Great Britain the regular Yacht Racing Association rule has been generally adopted, and handicaps deducted from it. In America models are divided into a single schooner with a maximum load-water-line of 63 in., and three classes of sloops, the first class including yachts with water-lines between 48 and 53 in., the second class those between 42 and 48 in. and the third and smallest class those between 35 and 42 in. A yacht with a shorter water-line than 35 in. must race in the third class. It has been found that yachts of smaller dimensions possess too little resistance to the wind.

See Model Sailing Yachts, in Marshall’s Practical Manuals series, 1871; and How to Build a Model Yacht, by Herbert Fisher (New York, 1902).

MODENA (ancient Mutina), one of the principal cities of Emilia, Italy, the chief town of the province of Modena and the seat of an archbishop, 31 m. E.S.E. of Parma by rail. Pop. (1906), 26,847 (town); 66,762 (commune). It is situated in a damp, low plain in the open country in the south side of the valley of the Po, between the Secchia to the west and the Panaro to the east. Some of its main streets (as their names indicate) follow the lines of canals, which still (though now covered) traverse the city in various directions. The observatory stands 135 ft. above the level of the sea. Dismantled since 1816, and now largely converted into promenades, the fortifications give the city an irregular pentagonal contour, modified at the north-west corner by the addition of a citadel also pentagonal. Within this circuit there are various open areas—the spacious Ipodromio in front of the citadel, the public gardens in the north-east of the city, the Piazza Grande in front of the cathedral, and the Piazza Reale to the south of the palace. The Via Aemilia passes obliquely right through the heart of the city, from the Bologna Gate in the east to that of Sant’ Agostino in the west.

Begun by the Countess Matilda of Tuscany in 1099, after the designs of Lanfranc, and consecrated in 1184, the Romanesque cathedral (S Geminiano) is a low but handsome building, with a lofty crypt, under the choir (characteristic of the Tuscan Romanesque architecture), three eastern apses, and a façade still preserving some curious sculptures of the 4th century. The interior was restored in 1897. The graceful bell-tower, erected in 1224-1310, named La Ghirlandina from the bronze garland surrounding the weathercock, is 335 ft. high; in the basement may be seen the wooden bucket captured by the Modenesi from the Bolognesi in the affray at Zappollo (1325), and famed by Tassoni’s Segcia Rapita. Of the other churches in Modena, the church of S Giovanni Decollato contains a Pieta in painted terra-cotta by Guido Mazzoni (1450-1518). The so-called Pantheon Estense (the church of S. Agostino, containing works of sculpture in honour of the house of Este) is a baroque building by Beggarel (1498-1565). The old ducal palace, begun by Duke Francis I. in 1625 from the designs of Avanzini, and finished by Francis Ferdinand V., is an extensive building with a fine courtyard, and now contains the military school and the observatory.

The Albergo d’Arti, built by Duke Francis III., accommodates the civic collections, comprising the Museo Lapidario (Roman inscriptions, &c.); the valuable archives, the Biblioteca Estense, with 90,000 volumes and 3000 MSS.; the Museo Civico, with large and good palaeo-ethnological and archaeological collections; a fine collection of textile fabrics, and the picture gallery, a good representative collection presented to the city by Francis V. and since augmented by the addition of the collection of the Marchese Campori. Many of the best pictures in the ducal collection were sold in the 18th century and found their way to Dresden. The town hall is a noteworthy building, with arcades dating from 1194, but in part rebuilt in 1856. The university of Modena, originally founded in 1665 by Francis II., is mainly a medical and legal school, but has also a faculty of physical and mathematical science. The old academy of the Disonmanti, founded in 1696 by Girolamo Sambucini, and afterwards the flourishing Royal Academy of Science and Art. In industrial enterprise silk and linen goods and iron wares are almost the only products of any note. Commerce is chiefly agricultural and is stimulated by a good position in the railway system, and by a canal which opens a water-way by the Panaro and the Po to the Adriatic. Modena is the point at which the railway to Mantua and Verona diverges from that between Milan and Bologna, and has several steam tramways to neighbouring places. It is also the starting-point of a once important road over the Apennines to Pistoia by the Abetone Pass.

Modena is the ancient Mutina in the territory of the Boi, which came into the possession of the Romans probably in the war of 215-212 B.C. In 183 B.C. Mutina became the seat of a Roman colony. The Roman town lay immediately to the south-east of the modern; its north-western wall is marked by the modern Corso Umberto I. (formerly Canal Grande). It appears to have been a place of importance under the empire, but none of its buildings is now to be seen. The Roman level, indeed,
is some 15 to 20 ft. below the modern town. Its vineyards and potteries are mentioned by Pliny, the latter doing a considerable export trade. Its territory was coterminous with that of Bononia and Regium, as its diocese is now, and to the south it seems to have extended to the summit of the Apennines. During the civil wars Marcus Brutus, the lieutenant of Lepidus, held it within its walls against Pompeius in 78 B.C., and in 44 B.C. the place was successfully defended by D. Brutus against Mark Antony for four months. The 4th century found Mutina in a state of decay; the ravages of Attila and the troubles of the Lombard period left it a ruined city in a wasted land. In the 7th century, perhaps owing to a terrible inundation, its walls were founded, at a distance of 4 m. to the north-west, a new city, Città Geminiana (still represented by the village of Cittanov); but about the close of the 9th century Modena was restored and refortified by its bishop, Ludovicus. When it began to build its cathedral (A.D. 1099) the city was part of the possessions of the Countess Matildis of Tuscany; but when, in 1184, the edifice was consecrated by Lucius III., it was a free community. In the wars between Frederick II. and Gregory IX. it sided with the emperor, though ultimately the papal party was strong enough to introduce confusion into its policy. In 1288 Obizzo d’Este was recognized as lord of the city; after the death of his successor, Azzo VIII. (1308), it resumed its communal independence; but by 1336 the Este family was again in power. Constituted a duchy in 1452 in favour of Borso d’Este, and enlarged and strengthened by Hercules II., it became the ducal residence on the incorporation of Ferrara with the States of the Church (1598). Francis I. (1529-1565) erected the citadel and commenced the palace, which was largely embellished by Francis II. Rinaldo (ob. 1737) was twice driven from his city by French invasion. To Francis II. (1668-1778) the city was indebted for many of its public buildings. Hercules III. (1727-1803) saw his states transformed by the French into the Cispadine Republic, and, having resolved the party by the abdication of Francis V., offered his resignation by the treaty of Campo Formio, died an exile at Treviso. His only daughter, Maria Beatrice, married Ferdinand of Austria (son of Maria Theresa), and in 1814 their eldest son, Francis, received back the Stati Estensi. His rule was subservient to Austria, reactionary and despotic. On the outbreak of the French Revolution of 1830, Francis IV. seemed for a time disposed to encourage the corresponding movement in Modena; but no sooner had the Austrian army put an end to the insurrection in Central Italy than he returned to his previous policy. Francis Ferdinand V., who succeeded in 1846, followed in the main his father’s example. Obliged to leave the city in 1848, he was restored by the Austrians in 1849; ten years later, on the 20th of August 1859, the representatives of Modena declared their territory part of the kingdom of Italy, and their decision was confirmed by the plebisce of 1860.

See Veduta storica di Modena (1668-1778) by Bosschi. Memorie storiche: Modena 1793; Scharfenberg, Gesch. des Herzogt. Modena (1859); Oreste Raggi, Modena descritta (1860); Baralda, Storia di Modena; Valdrighi, Diz. Storico, etc. delle contrade di Modena (1798-1800); Crespiellini, Guida di Modena (1798); Cavedoni, Dihcarrazione degli stadi della storia di Modena (1828).

MODERATOR (from Lat. moderare, to impose a modus, limit), a judge or umpire, one who acts the part of mediator, and so a term used of the person chosen to be president of a meeting (as in America, of a town meeting). In academic use, the word was formerly applied to the public officer who presided over the exercises, &c., prescribed for candidates for degrees in the university schools; it is now used at Cambridge of one or two officers who are appointed each year to preside over the examination for the mathematical tripos, at Oxford of an examiner in the first public examination, known as “moderations,” and at Dublin of a candidate for honours in the examination for degree of Bachelor of Arts. In the Presbyterian churches the name is applied to the minister elected to preside over ecclesiastical meetings or assemblies, as the synod, presbytery or general assembly (see PRESBYTERIANISM). The name was historically given to a party of people who joined together to oppose the “Regulators,” another party who professed to administer justice in the Carolinas (1767-1771). Technically, the word is also used of a particular form of lamp, in which the flow of oil from the reservoir to the burner is regulated by a mechanical arrangement to which the name is applied.

MODERATUS OF GADES, a Greek philosopher of the Neo-Pythagorean school, contemporary with Apollonius of Tyana. He wrote a great work on the doctrines of the Pythagoreans, and tried to show that the successors of Pythagoras had made no additions to the views of their founder, but had merely borrowed and altered the phraseology. He has been given a fictitious importance by recent commentators, who have regarded him as the forerunner of the Alexandrian School of philosophy. Zeller has shown that the authority on which this view is based is entirely unsound. Moderatus is thus left as an unimportant though interesting representative of a type of thought which had almost disappeared since the 5th century B.C.

Stobaeus, Eloges, p. 3, preserves a fragment of his writings.

MODESTINUS, HERENNIUS, a celebrated Roman jurist, who flourished about 250 A.D. He appears to have been a native of one of the Greek-speaking provinces, probably Dalmatia, and was a pupil of Ulpius. In Valentinian’s Law of Citations he is classed with Papinius, Paulus, Gaius and Ulpian. He is mentioned in a rescript of Gordian in the year 240 A.D. in connexion with a responsum which he gave to the party to whom the rescript was addressed. No fewer than 345 passages in the Digest are taken from his writings.

MODICA, a town of Sicily, in the province of Syracuse, 57 m. W.S.W. of Syracuse by rail and 33 m. direct. Pop. (1901), 48,962. It lies on a hill between two valleys; the hill, crowned by the church of St. Giorgio, reconstructed in the 19th century, was the site of the Sicel town of Motyea, while the modern part of the town extends along the river Mauro, an inundation of which did much damage in September 1902. Remains of megalic buildings, apparently, however, houses of the Byzantine period, are described in Notizie degli Scavi, 1896, 427 seq. Six miles to the south-east is the valley known as the Cava d’Isopo, with hundreds of grotoess cut in its rocky sides; of these only a few are Sicel tombs, the majority being catacombs or open tombs of the early Christian and Byzantine periods, or even cave-dwellings of the latter age.

See P. Orsi in Notizie degli Scavi (1905), 431.

MODILLION (a French word, probably from Lat. modus, a measure, a proportion), a term in architecture for the enriched block or horizontal bracket generally found under the cornice and above the bedmould of the Corinthian entablature. It is probably so called because of its arrangement in regulated distances.

MODJESKA, HELENA (1844-1909), Polish actress, was born at Cracow on the 12th of October 1844. Her father, Michael Opido, was a musician, and her tastes soon declared themselves strongly in favour of a dramatic career; but it was not until after her marriage in 1861 that she first attempted to act, and then it was with a company of strolling players. Her husband (whose name, Modrzejowski, she simplified for stage purposes) died in 1865. In 1868 she married Count Bozena Chapławski, a Polish politician and critic, and almost immediately afterwards received an invitation to act at Warsaw. There she remained for seven or eight years, and was a high position in her art. Her chief tragic roles were Ofelia, Juliet, Desdemona, Queen Anne in Richard III., Louisa Miller, Maria Stuart, Schiller’s Princess Eboli, Marion Delorme, Victor Hugo’s Tisbé and Słowacki’s Maria. In only one of her favourite roles were Beatrices in Much Ado About Nothing, and Donna Diana in the Polish translation of an old Spanish play of that name. Madame Modjeska was also the Polish interpreter of the most prominent plays of Legouvé, Dumas, father and son, Augier, Alfred de Musset, Octave Feuillet and Sardou. In 1876 she went with her husband to California, where they settled on a ranch. This new career, however, proved a failure, and Madame Modjeska returned to
MÖDLING—MOESIA

643

of the port of Crocidopolis, and projected into the lake on high bases. At the Nile fell the broad expanse of the lake lowered, and the water pouring back through the channel was of value for summer irrigation; the inflow and outflow were regulated by sluices, and the capture of fish here and in the lake was enormous. The channel which was of such importance was called the “Great Channel,” Mewër, in Greek Moeris. The native name of the lake was Shei, “the lake,” later Piöm, “the sea” (whence Fayum); Teshei, “the land of the lake,” was the early name of the region. At its capital Crocidopolis and elsewhere the crocodile god Sobk (Suchus) was worshipped. Senwosri II. of the XIIth Dynasty built his pyramid at Illahun at the outer end of the channel, Amenemhé III. built his near the inner end at Hawara, and the vast labyrinth attached to it was probably his funerary temple. This king was afterwards worshipped in more than one locality about the lake under the name Marres (his praenomen Nemërê) or Peremarres, i.e. Pharaoh Marres. The mud poured in at high Nile made rich deposits on the eastern slope; in the reign of Philadelphia large reclamation of land were made, veterans from the Syrian War were settled in the “Lake” (Alwy), and the latter quickly became a populous and very fertile province. Strabo’s account of the lake of Moeris must have been copied from earlier writers, for in his day the outflow had been drained probably for two centuries; the lake was dotted with flourishing villages to a great depth below the level of the Nile. Large numbers of papyri of the Ptolemaic and Roman periods have been found in and about the Fayum, which continued to flourish through the first two centuries of the Roman rule.

MOESIA (Gr. Μοείεα and Μοίεαι ἡ ἐπὶ Εὔρωπη, to distinguish it from Mysia in Asia), in ancient geography, a district inhabited by a Thracian people, bounded on the S. by the mountain ranges of Haemus and Scardus (Scorduri, Scodorus), on the W. by the Drinus, on the N. by the Danube and on the E. by the Euxine. It thus corresponded in the main to the modern Servia and Bulgaria. In 75 B.C., C. Scribonius Curio, proconsul of Macedonia, penetrated as far as the Danube, and gained a victory over the inhabitants, who were finally subdued by M. Licinius Crassus, granting them the tributary and also proconsul of Macedonia, 20 B.C. under the reign of Augustus, forming the region of Moesia Superior. Here it is situated the Moesia (belonging to the Augustan Provinces of the Roman Empire, Eng. trans., i. 12–14). The country, however, was not organized as a province until the last years of the reign; in a.d. 6 mention is made of its governor, Caecina Severus ( Dio Cassius iv. 29). The statement of Appian (Illyrica, 30) that it did not become a Roman province until the time of Tiberius, is therefore incorrect. Originally one province, under an imperial consular legate (who probably also had control of Achaea and Macedonia), it was divided by Domitian into Upper (superior) and Lower (inferior), also called Ripa Thracia Moesia, the western and eastern portions respectively, divided from each other by the river Cebros (Cbibrus; mod. Chiritsa or Zibra). Some, however, place the boundary further west. Each was governed by an imperial consular legate and a procurator. As a frontier province, Moesia was strengthened by stations and fortresses erected along the southern bank of the Danube, and a wall was built from Axiopolis to Tomi as a protection against Scythian and Sarmatian inroads. After the abandonment of Dacia (q.v.) to the barbarians by Aurelian (270–275) and the transference of its inhabitants to the south of the Danube, the central portion of Moesia took the name of Dacia Aureliana (again divided into Dacia ripensis and interior). The district called Dardania (in Upper Moesia), inhabited by the Illyrian Dardani, was formed into a special province by Diocletian with capital Naisus (Nissia or Nish), the birthplace of Constantine the Great. The Goths, who had already invaded Moesia in 230, hard pressed by the Hun, again crossed the Danube during the reign of Valens (375), and with his permission settled in

the stage. She appeared in San Francisco in 1877, in an English version of Adrienne Lecouvreur, and, in spite of her imperfect command of the language, achieved a remarkable success. She continued to act principally in America, but was also seen from time to time in London and elsewhere in the United Kingdom, her repertoire including several Shakespearean rôles and a variety of emotional parts in modern drama. She died on the 4th of April 1900 at her home near Los Angeles, California.

See Mabel Collins, The Story of Helena Modjeska (London, 1883), and the (autobiographical) Memories and Impressions (New York, 1910). 

MÖDLING, an old town of Austria, in Lower Austria, 10 m. S. of Vienna by rail. Pop. (1900), 15,304. It is situated at the entrance of the Brühl valley and is a popular summer resort, possessing iron and sulphur baths. It possesses a Gothic church, with a crypt dating from the 12th century, and a still older Romanesque burial chapel. It has a considerable iron and metal industry, and manufactures of shoes, varnish, &c.

MOLOC (i.e. “southerners”), a tribe of North American Indians of the Lutuanian stock, who formerly lived around Lower Klamath Lake, south-western Oregon. They were always an aggressive people, and constantly at war with their neighbours. They are known mainly from their stubborn resistance to the United States government in 1872 and 1873. This is called the Modoc War, and the tribe were forced to make terms on them. After some preliminary fighting the Modocs retreated to the “Lava Beds,” a basaltic region, seamed and crevassed, and rich in caves. Here they made a stand for several months. During the war two members of a peace commission were treacherously massacred by them while under a flag of truce. On their final submission the leaders were hanged and part of the tribe was removed to Indian Territory (now Oklahoma), and the others were sent back to a reservation on the Klamath.

MODULE (Lat. modus, a measure), in architecture, the semi-diameter of the column at its base; the term was first set forth by Vitruvius (iv. 3), and was generally employed by the architects of the Italian revival to determine the relative proportions of the various parts of a columnar ornament. The module was divided by the revivalists into thirty parts, called minutes, allowing of much greater accuracy than was thought necessary by Vitruvius, whose subdivision was usually six parts. The tendency now is to adopt the whole diameter instead of the semi-diameter when determining the height of the column or entablature or any other portion of the elevation. The term module is also used in hydraulics (q.v.) to a contrivance for regulating the supply of water from an irrigation channel.

MOERIS, AElius, Greek grammarian, surnamed Atticista (“the Atticist”), probably flourished in the 2nd century A.D. He was the author of an extant (more or less alphabetic) list of Attic forms and expressions (Ἀττικάς Λέξεις), accompanied by the Hellenistic parallels of his own time, the differences of gender, accent and meaning being clearly and succinctly pointed out.

Editions by J. Hudson (1711); J. Pierson (1755); A. Koch (1830); 1. Beker (1833); with Harpocratis.

MOERIS, LAKE OF, the lake which formerly filled the deep depression of the Fayum to the Nile level, now shrunken and sunk more than 200 ft. to the shallow Birket el Kerûn. In remote prehistoric times the Fayum depression was probably dry, but with the gradual rise of the river bed the high Nile reached a level at which it could enter through the natural or artificial channel now known as the Bahr Yusuf. The borders of the lake were occupied by a neolithic people, and the town of Axio polis grew up on the eastern shores along the course of the channel, where the higher ground formed a ridge in the lake. The water (rising at the rate of about 4 in. to the century) the waters threatened to flood the town; consequently under the XIIth Dynasty great embankments were made to save the settled land from encroachment. The line of the embankment is still traceable in places and marked by monuments of the XIIth Dynasty kings, an obelisk of Senwosri I. at Ebgig, and colossi of Amenemhé III. at Biahmu. The latter ornamented the quay
MoFADDALYAT

MoFADDALYAT, strictly MuFADDALYAT, an anthology of ancient Arabic poems, which derives its name from al-Mufaddal, son of Muḥammad, son of Ya'la, a member of the tribe of Ḍabbā, who compiled it sometime between A.D. 762 and 784 in the latter of which years he died. Al-Mufaddal was a contemporary of Ḥammād ar-.getRawiya and Khalaf al-Armar, the famous collectors of ancient Arab poetry and tradition, and was somewhat the junior of Abū 'Amr ibn al-'Aṣmī, the first scholar who systematically set himself to preserve the poetic literature of the Arabs. He died about fifty years before Abū 'Ubaidā and al-Āṣmī, to whose labors posterity is largely indebted for the arrangement of most of the poems in their anthology, and his anthology was put together between fifty and sixty years before the compilation by Abū Tamām of the Ḥamās (q.v.).

Al-Mufaddal was a careful and trustworthy collector both of texts and traditions, and is praised by all authorities on Arabian history and literature as in this respect greatly the superior of Ḥammād and Khalaf, who are accused (especially the latter) of unscrupulous fabrication of poems in the style of the ancients. He was a native of Kháfa, the northernmost of the two great military colonies founded in 638 by the caliph 'Omar for the control of the wide Mesopotamian plain. In Kháfa and Basrah were gathered representatives of all the Arabian tribes who formed the fighting force of the Islamic Empire, and from these al-Mufaddal was able to collect and record the compositions of the poets who had celebrated the fortunes and exploits of their forefathers. He, no doubt, like al-Āṣmī and Abū 'Ubaidā himself visited the areas occupied by the tribes for their camping grounds in the neighboring desert; and adjacent to Kháfa was al-Ḫirā, the ancient capital of the Lakhmid kings, whose court was the most celebrated center in pre-Islamic Arabia, where, in the century before the preaching of the Prophet, kings from the whole of the northern half of the peninsula were wont to assemble. There is indeed a tradition that a written collection (dawān) existed in the family of an-Nu'mān, the last Lakhmid king, containing a number of poems by the Fūhāl, or most eminent poets of the pagan time, and especially by those who had praised the princes of the house, and that this collection passed into the possession of the Omayyad caliphs of the house of Marwān; to this, if the tradition is to be believed, al-Mufaddal probably had access.

The date of al-Mufaddal's birth is unknown; but he lived for many years under the caliphs of the Omayyad line until their overthrow by the 'Abbasids in 749. In 762 he took part in the rising led by Ibārīm ibn 'Abdallāh ibn al-Iṣān, the 'Alīd, called "The Pure Soul," against the caliph al-Mansūr, and after the defeat and death of Ibārīm was cast into prison. Al-Mansūr, however, pardoned him on the intercession of his fellow-traveller Musayyab ibn Zuḥayr of Dabba, and appointed him the instructor in literature of his son, afterwards the caliph al-Mahdī. It was for this prince that, at al-Mansūr's instigation, al-Mufaddal compiled the MuFADDALYAT.

The collection, in its present form, contains 126 pieces of verse, long and short; that is the number included in the recension of al-Anbārī, who has the text from Abū 'Ikrima of Ḍabbā, who read it with Ibn al-Arābī, the stepson and inheritor of the tradition of al-Mufaddal. We know from the Fihrīst of Muḥammad an-Nāṣirī (A.D. 988) that in that year 128 pieces were counted in the book; and this number agrees with that contained in the Vienna MS., which gives an additional poem, besides those annotated by al-Anbārī, to al-Muqaddāsī the Elder, and adds at the end a poem by al-Fārīsh ibn Ḥillīla. The Fihrīst (p. 65) that some scholars included more of the fewest poems, while the order of the poems in the several recensions differed; but the correct text, the author says, is that handed down through Ibn al-Arābī. It is noticeable that this traditional text, and the accompanying scholia, as represented by al-Anbārī's recension, are wholly due to the scholars of Kháfa, to which place al-Mufaddal himself belonged. The rival school of Basra, on the other hand, has given currency to a story that the original collection made by al-Mufaddal included a much smaller number of poems. The Berlin MS. of al-Marzāqī's commentary states that the number was thirty, but a better reading of the passage, found elsewhere, mentions eighty; and that al-Asma'ī and his school added to this nucleus of poems which increased the number to a hundred and twenty. It is curious that this tradition is ascribed by al-Marzāqī and his teacher Abū All al-Fārīsh to Abū 'Ikrima of Ḍabbā, who is represented by al-Anbārī as the transmitter of the correct text from Ibn al-Arābī. There is no mention of it in al-Anbārī's work, and it is in itself somewhat improbable, as in al-Āṣmā'ī's time the schools of Kháfa and Basrah were in sharp opposition one to the other, and Ibn al-Arābī in particular was in the habit of censuring al-Āṣmā'ī's interpretations of his authority. It is scarcely likely that Ibn al-Arābī would have accepted his rival's additions to the work of his step-father, and have accepted them on to Abū 'Ikrima with his annotations.

The collection is one of the highest importance as a record of the thought and poietic art of Arabia during the time immediately preceding the appearance of the Prophet. Not more than five or six of the 126 poems appear to have been composed by poets who had been born in Islam. The great majority of the authors belonged to the days of "the Ignorance," and though a certain number (e.g. Muṭṭamīm ibn Nūwāra, Rabba ibn Maqrum, Abda ibn at-Tābib and Abū Dhū'āib), born in paganism, accepted Islam, their work bears few marks of the new faith. The ancient virtues—hospitality to the guest and the poor, profuse expenditure of wealth, valor in battle, faithfulness to the cause of the tribe—are the themes of praise; wine and the game of māṣir, forbidden by Islam, are celebrated by poets who professed themselves converts; and if there is no mention of the old idolatry, there is also little spirituality in the outlook on life. The 126 pieces are distributed between 68 poets, and the work represents a predominance from the compositions of those who were called muqallīn, "authors of whom little has survived," in contrast to the famous poets whose works had been collected into dawān. At the same time many of them are extremely celebrated, and among the pieces selected by al-Mufaddal several reach a very high level of excellence. Such are the two long poems of Alqama ibn 'Abada (Nos. 222 and 120), the three odes by Muṭṭamīm ibn Nūwāra (Nos. 9, 67, 78), the splendid poem of Sālīma ibn Ḥandal (No. 22), the beautiful nasib of ash-Shanfarā (No. 20), and the death-song of 'Abd Yagūth (No. 30). One of the most admirable and famous is the last of the series (No. 126), the long elegy by Abū Dhū'āib of HDDH in the death of his sons; almost every verse of this poem is cited in illustration of some phrase or meaning of a word in the national lexicons. Only one of the poems of the Mu'alluqāt (see Mollā'akkāt), al-Ḥārith, son of Ḥillīla, is represented in the collection. Of others (such as Bishir ibn Abī Khāzim, Al-Hādīr, Ṭāhir ibn al-Tūfālī, Alqama ibn 'Abada, al-Muṭṭamīm, Ṭa'bbaṣa Sharār and Abū Dhū'aib) dawān or bodies of collected poems exist, but it is doubtful how far these had been brought together when al-Mufaddal made

1 In the dawān or supplement to the Amān of al-Qāṭī. (Eda Cairo 1924 H., p. 131.)
MOFETTA—MOGADOR

MOFETTA (Ital. from Lat. meophilis, a pestilential exhalation), a name applied to a volcanic discharge consisting chiefly of carbon dioxide, often associated with other vapours, representing the final phase of volcanic activity. The word is used frequently in the plural as moftete, or, following the French, moftettes. The volcanic vents yielding the emanations are sometimes called moftete. They are not uncommon in Auvergne and in the Eifel, notably on the shore of the Laacher See; whilst other examples are furnished by the Grotta del Cane, near Puzzolli, the Valley of Death in Java, and the Death Gulch in the Yellowstone Park.

MOFFAT, ROBERT (1795-1883), Scottish Congregationalist missionary to Africa, was born at Ormiston, Haddingtoshire, on the 21st of December 1795, of humble parentage. He began as a gardener, but in 1814, when employed at High Leigh in Cheshire, offered himself to the London Missionary Society, and in 1816 was sent out to South Africa. After spending a year in Namaqua Land, with the chief Afrikaner, whom he converted, Moffat returned to Cape Town in 1819 and married Mary Smith (1795-1870), the daughter of a former employer, a remarkable woman and most helpful wife. In 1820 Moffat and his wife left the Cape and proceeded to Griqua Town, and ultimately settled at Kuruman, among the Bechuana tribes living to the west of the Vaal river. Here he worked as a missionary till 1870, when he reluctantly returned finally to his native land. He made frequent journeys into the neighbouring regions as far north as the Matabele country. The results of these journeys he communicated to the Royal Geographical Society (July 1864, &c.), and when in England on furlough (1839-1843) he published his well-known Missionary Labours and Scenes in South Africa (1842). He translated the whole of the Bible and The Pilgrim's Progress into Sechswana. Moffat was builder, carpenter, smith, gardener, farmer, all in one, and by precept and example he succeeded in turning a horde of bloodthirsty savages into a "people appreciating and cultivating the arts and habits of civilized life, with a written language of their own." He met with incredible discouragement and dangers at first, which he overcame by his strong faith, determination and genial humour. It was largely due to him that David Livingstone, his son-in-law, took up his subsequent work. On his return to England he received a testimonial of £500. He died at Leigh, near Tunbridge Wells, on the 9th of August 1883.

MOFFAT, a burgh of barony, and police burgh, of Upper Annandale, Dumfriesshire, Scotland. Pop. (1911), 2153. It is situated on the N.N.E. of Dumfries by road and 63 m. distant by rail from the Caledonian and Edinbugh to Glasgow. It is the terminus of a branch line from Beattock, 2 m. distant. It has been famous for its sulphur and saline waters since the middle of the 18th century, and also enjoys great vogue as a holiday resort. The hills in the locality range from the adjacent Gallow Hill (832 ft.) to Hartfell (2615 ft.); about 5 m. north there is abundance of beautiful and varied scenery on the Annan, the Evan, the Birnock and the Moffat. The spa, a mile to the north of the town, was acquired by the burgh commissioners in 1808, and there are also spas at Hartfell (3½ m. north) and Garpel (2½ m. south-west). Dumfriess House, 2 m. south-west, is the seat of Lord Rollo.

MOGADOR (Es-Sueira), the most southern seaport on the Atlantic coast of Morocco, in 31° 50' N., 5° 20' W., the capital of the province of Hâdiâ. Pop. (1908), about 20,000, of whom nearly a half are said to be Jews, and about 100 Europeans. The town stands from 10 to 20 ft. above high water on a projecting ridge of calcareous sandstone. In certain states of wind and sea it is turned almost into an island, and a sea-wall protects the roadstead. On the town are strolled with broom, and beyond, the argan forests, distinctive of southern Morocco. Approached from this side the city bursts on the view like a mirage between sky and sea, and this perhaps entitles it to its name—Es-Sueira—"the picture." It is the best planned and cleanest town in the empire, and this combined with the climate, which is very equable, makes it a health resort, especially for consumptive patients. The mean temperature of the hottest month is 71°-06, and of the coolest month 58°-69. The rainfall varies between 13 and 20 in. annually. The water supply is carried by an overground conduit from a spring near...
Diabat. The prosperity of Mogador is due to its commerce. The harbour is well sheltered from all winds except the southwest, but escape is difficult with the wind from that quarter, and is generally second in point of trade, which is carried on mainly with Marseilles, London, Gibraltar and the Canaries, among the principal exports being almonds, goat-skins, gums and olive-oil, and the principal imports cotton goods, sugar and tea. The exports were valued at £40,000 in 1900 and at £36,600 in 1906. The imports were worth £246,000 in 1900 and £268,000 in 1906. Shipping, 1900, 132,000 tons; 1906, 140,000 tons.

A place called Mogador is marked in the 1531 Portulan of the Laurentian library, and the map in Hondius's "Atlas minor" shows the island of Mogador, I. Dornegor; but the origin of the present town is much more recent. Mogador was founded by Mohammed XVII. (bin Abd Allah) in 1760, and completed in 1770. The Portuguese called it after the shrine of Sidil Megilul, which lies towards the south half-way to the village of Diabat, and forms a striking landmark for seamen. In 1844 the citadel was bombarded by the French.

Mogilev, a government of western Russia, situated on the upper Dnieper, between the governments of Vitebsk and Smolensk on the north and east, and Chernigov and Minsk on the south and west. In the north it is bounded by the watershed between the basins of the Dvina and the Dnieper, an undulating tract 650 to 900 ft. above sea-level, and covered nearly everywhere with forests. This watershed slopes gently to the south, to the valley of the Dnieper, which enters the government from the north-east and flows due south. The southern part of the government is flat and has much in common with the Polesye of the government of Minsk; it is, however, more habitable, the marshes being less extensive. Mogilev is built up of Devonian deposits in the north, of Cretaceous in the east, and of Tertiary elsewhere, but generally is covered with a thick layer of Glacial and later alluvial deposits. Interesting finds from the Stone Age, as well as remains of the mammoth, have been made.

The soil is mostly sand, clay (brick-clay and potter's-clay are not uncommon), and peat-bogs, with a few patches of "black earth." The climate is harsh and wet, the average yearly temperature at the Gorki meteorological observatory being 40°-4 F. (14°-2 in January and 63°-8 in July); cold nights in summer are often the cause of bad crops. The government had 947,658 inhabitants in 1897, and in 1897, 1,760,511, of whom 866,514 were women, and 146,752 lived in towns. The estimated population in 1906 was 2,024,300. The population is mostly White Russian. Agriculture is their chief occupation. Out of the total area of 18,568 sq. m. 40 % is held in communal ownership by the peasants, 48 % is owned by landlords possessing more than 270 acres each, and 32 % by small owners. Most of the private owners belong to the nobility. The principal crops are rye, oats, barley, buckwheat, potatoes, though wheat, beetroot, flax, hemp and tobacco are also grown. Paper, spirits, wire and nails, leather and tiles are the chief products of the district. The government is divided into eleven districts, of which the chief towns with their populations in 1897 were: Mogilev-on-Dnieper, or Mogilev Gubernskyi (47,591 in 1900), Chausy (55,520), Cherikov (52,520), Homel or Grodno (45,081 in 1900), Gorki (67,070), Klimovichi (4706), Mstislavl (103,820 in 1900), Orsha (13,161), Rogachev (10,013), Starzy Bykhov (65,854), and Syenno (4061).

This government was inhabited in the 10th century by the Slav tribes of the Kivichi and Radimichi. In the 14th century it became part of Lithuania, and afterwards of Poland. Russia annexed it in 1772.

MOGILEV ON THE DNIESTER, a town of Russia, capital of the government of Mogilev. Pop. (1900), 47,591, two-thirds Jews. It is situated on a hilly site on both banks of the Dnieper, 123 m. by rail S.W. of Smolensk. It is the see of an archbishop of the Orthodox Greek Church. The public buildings include the cathedral of the Orthodox Greek Church (founded by Catherine II. of Russia and Joseph II. of Austria in 1780), a Roman Catholic cathedral (built in 1692), an old castle, a museum, a church dating from 1620, and an old Tatar tower. The principal industries are tanneries. The commerce is mostly in the hands of Jews. Corn, salt, sugar, tobacco, and manufactured wares, imported from Germany, are sent to the southern governments.

Mogilev is mentioned for the first time in the 14th century as a dependency of the Vitebsk, or of the Malslav principality. At the beginning of the 15th century it became the personal property of the Polish kings. But it was continually plundered—either by Russians, who attacked it six times during the 16th century, or by Cossacks, who plundered it three times. In the 17th century its inhabitants, who belonged to the Orthodox Greek Church, suffered much from the persecutions of the United Greek Church. In 1654 it surrendered to Russia, but in 1661 the Russian garrison was massacred by the inhabitants. In the 18th century the town was taken several times by Russians and by Swedes, and in 1708 Peter the Great ordered it to be destroyed by fire. It was annexed to Russia in 1772. Near here the French under Davout defeated the Russians under Bagration on the 23rd of July 1812.

MOGILEV ON THE DNIESTER, a town of Russia, in the government of Podolia, on the left bank of the Dnieper, 57 m. S.E. of Smolensk, and 55 m. N.W. of Warsaw. Pop. of town, 48,000; of smaller settlements and manufactories, nearly one-half Jews; the remainder are Little Russians, Poles and a few Armenians. The Little-Russian inhabitants carry on agriculture, gardening, wine-growing and mulberry culture. The Jews and Armenians are engaged in a brisk trade with Odessa, to which they send corn, wine, spirits and timber, floated down from Galicia, as well as with the interior, to which they send manufactured wares imported from Austria.

Mogilev, named in honour of the Moldavian hospodar Mohila, was founded by Count Potocki about the end of the 16th century. Owing to its situation on the highway from Moldavia to the Ukraine, at the passage across the Dnieper, it developed rapidly. For more than 150 years its possession was disputed between the Cossacks, the Poles and the Turks. It remained in the hands of the Poles, and was annexed to Russia in 1795.

MOGUL, MOCHAL, or MOGHAL, the Arabic and Persian form of the word Mongol, usually applied to the Mahomedan Empire in India, which was founded by Baber. In consequence the name is applied to all foreign Mahomedans from the countries on the west and north-west of India, except the Pathans. The Great Mogul is the name given to the Mogul emperors of Delhi by the Portuguese and subsequently by Europeans generally.

MOHACS, a market town of Hungary, in the county of Baranya, 115 m. S. of Budapest. Pop. (1900), 15,812. It is situated on the right bank of the Danube, and carries on a brisk trade in wine and the agricultural produce of the neighbourhood. Amongst its principal buildings are an old castle and the summer palace of the bishop of Pécs. Mohács is famous in the history of Hungary by the two fatal battles which took place in the plain situated about 3 m. south-west of the town, and marked the beginning and the close of the Turkish dominion in Hungary. In the first (Aug. 29, 1526) the Hungarian army under Louis II.
was annihilated by the Ottoman forces led by Soliman the Magnificent. In the second (Aug., 1687) the Austrians under Chatelet of Lorraine gained a decisive victory over the Turks, whose power was afterwards still further broken by Prince Eugene of Savoy.

**MOHAIR**

The hair of a variety of goat originally inhabiting the regions of Asiatic Turkey of which Angora is the centre, whence the animal is known as the Angora goat. The Arabic *mubâyyar*, from which the word came into English probably through the Ital. *moccacaro* or Fr. *mocaïar*, meant literally, "choice" or "select," and was applied to cloth made of goats' hair. In the 17th century the word, which before appears in such forms as *moccyare* or *mokaire*, became corrupted by connexion with "hair," cf. "cray-fish" from *crevisse*. From the English "mohair" the French adapted *moire*, a watered silk fabric.

The typical mohair fibre is 7 to 8 in. long, very lustrous owing to its physical structure (which although akin to wool is different in that the wool scales are indicated only instead of being fully developed, while the fibre is always solid), 93% to 98% of an inch in diameter, of a soft elastic handle, and usually of a clear white transparent colour. The staples of which the fleece is formed should be uniform in length and clearly defined, naturally lending themselves to a good "spin"—a difficult attainment in the case of mohair (see *WOOLEN AND WORSTED MANUFACTURES*).

There are many varieties of mohair, from the first qualities as here defined to lower qualities of a Kempy, unsatisfactory character. Thus in Constantinople, the chief centre of the Turkey mohair trade, a large variety of fleeces is recognized. For example, from the Lake Van district a distinctly inferior kind known as "Van" mohair is obtained, while other districts produce varieties ranging from Van up to the typical quality described above.

The animal from which mohair was originally obtained was a finely-bred Angora goat. Owing to the demand for raw material exceeding the supply, from 1820 onwards there has been a great deal of crossing of the well-bred Angora with the common kind of goat: in fact it has been said that by 1863 the original Angora had practically disappeared. The growing demand for mohair further resulted in attempts on a commercial scale to introduce the goat into South Africa—where it was crossed with the native goat—the United States, Australia, and later still New Zealand. Perhaps the introduction of the Angora into Australia and New Zealand may in part be due to its value as a scrub and blackberry browser; these growths being the "pests" of the two respective countries.

The manufacture of fabrics from mohair—as in the case of alpaca and cashmere—was in the first instance due to the genius of the rearers of the goat. It would, indeed, be interesting to know if the present day mohair goods—often styled "alpacas"—really had their origin in the earlier products of Asia Minor. That fabrics of mohair were in use in England early in the 18th century is obvious from Pope's allusion:

"And, when she sees her friend in deep despair,
    Observes how much a chintz exceeds mohair."

Raw mohair was first exported from Turkey to England about 1820, and from that date onwards marked strides were made in its manufacture into useful yarns and fabrics. England has always had, and still maintains, supremacy in this manufacture. Practically the whole of both the Turkish and Cape clips is at least converted into yarn in Yorkshire mills. Quantities of these yarns are also woven into dress goods, dust coverings, pile fabrics, imitation furs, &c., in Yorkshire, but even greater quantities of mohair yarn are exported to Russia, Germany, Austria, &c., to be converted into astrakans, ordinary braids, brush braids, &c. In the first decade of the 20th century the mohair braid trade received a blow from the introduction of artificial silk.

The history of the introduction of the Angora goat from Asia Minor into the other countries mentioned is as follows. In 1838 pure bred Angoras were introduced into Cape Colony—cashmeres having been previously tried and found unsatisfactory. These pure-bred goats crossed with the common goat laid the basis of the Cape flocks. In 1856-1857 other importations of pure-bred goats were made. From 1868 to 1897 further importations were made, but these were not of the pure-bred goat and consequently were not so valuable. It should here be noted that the Cape flock-owner clips twice—the summer clip yielding a staple which should be of not less than 7 in., and the winter clip a staple which should be of not less than 3 in. to 4 in. Bradford from time to time has objected to the winter clip as being too short, but this clip seems to have established itself and at least once during recent years has been as saleable as the summer clip. The introduction of Angoras into the United States took place in 1840. Other importations of goats from Asia Minor were made between 1857 and 1880, and interchanges of blood also took place between the United States and Cape Colony. Between 1856 and 1875 some three hundred goats were introduced into Australia. Other importations from Cape Colony and the United States have also been made from time to time, and it seems at least possible, if not probable, that Australia may yet find the Angora goat an important asset.

From the following statistics relating to mohair it will be realized that the mohair supply practically comes from two sources, viz. Turkey in Asia and South Africa:

<table>
<thead>
<tr>
<th>Country</th>
<th>No. of Goats</th>
<th>Yield of Hair</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asia Minor</td>
<td>33 to 4 millions</td>
<td>11 to 12,000,000 lb.</td>
</tr>
<tr>
<td>Africa</td>
<td>12 to 14,000,000 lb.</td>
<td></td>
</tr>
<tr>
<td>United States</td>
<td>800,000</td>
<td>1,600,000 lb.</td>
</tr>
<tr>
<td>Australia</td>
<td>39,000</td>
<td></td>
</tr>
</tbody>
</table>

The price per lb of mohair has varied from 4s. 1d. in 1870 to 13d. or 1d. in 1903, and it is interesting to note that the shipments from Turkey to England follow these price fluctuations in a most curious manner.

Of the consumers of English mohair yarns Russia takes from 15 to 25%, and the continent of Europe as a whole a very large percentage of the total mohair yarn production of Bradford.

**MOHAVE** (corrupted from *homok-habii*, "three mountains", their native name, with reference to three peaks, which form a prominent feature of their country), a tribe of North American Indians of Yuman stock. They have always lived along both banks of the lower Colorado river, in Arizona and California.

**MOHAWK**, a tribe of North American Indians, the chief people of the Iroquois confederacy. The name probably means "man-eaters"; they call themselves *Kaniengkaha*, "fint people". Their villages were in the valley of the Mohawk river, New York. Their territory extended northward to the St Lawrence and southward to the Delaware river and Catskill Mountains. They were thus early in touch with Dutch and English, and were the first Indians to obtain firearms. In the War of Independence they fought with the English, and finally took refuge in Canada, where most of them have remained.

**SEEN INDIANS, NORTH AMERICAN**. For Mohawk cosmology see 22nd Annual Report Bureau Amer. Ethnol. (1899-1900).

**MOHICAN, MAHICAN AND MOHEGAN**, the first two the alternative names of an important tribe and confederacy of North American Indians of Algonquin stock, and the last a dialectic form of the name applied to a branch tribe. The Mohicans inhabited the Hudson valley, and their domain extended into Massachusetts. The Mohicans were called by the French *Loups* (wolf Indians), a translation of "Mohican." At first their council-fire was at Schodac, on an island near Albany, and they were grouped in forty villages. In consequence of attacks by the Mohawks, they moved their council-fire to what is now Stockbridge, Massachusetts, in 1664; in 1730 many migrated to the Susquehanna valley, Pennsylvania, and became absorbed into the Delawares. In 1736 those left in Massachusetts were placed on a reservation at Stockbridge, and called by that name. A few of these Stockbridge Indians, who may be truly called "the last of the Mohicans," are now settled, with some of the Munsees, on a reservation at Green Bay, Wisconsin. The Mohegans, originally an offshoot of the Mohican, lived on Thames river, Connecticut, their country extending into Massachusetts and including Rhode Island. In 1637, on the destruction of the Pequots, an offshoot of the Mohegans, the Mohegans claimed their country too, and thus the territorial power of the
two tribes was consolidated under one Mohegan chief. For some time the Mohegans remained the supreme Indian people of southern New England. Eventually they sold most of their lands and centred in a small reservation on Thames river. They have now practically become extinct.

MOHL, HUGO VON (1805–1872), German botanist, was born at Stuttgart on the 8th of April 1805. He was a son of the Württemberg statesman Benjamin Ferdinand von Mohl (1766–1849), the family being connected on both sides with the higher class of state officials of Württemberg. While a pupil at the gymnasium he pursued botany and mineralogy in his leisure time, till in 1823 he entered the university at Tubingen. After graduating with distinction in medicine he went to Munich, where he met a distinguished circle of botanists, and found ample material for research. This seems to have determined his career as a botanist, and he started in 1828 those anatomical investigations which continued till his death. In 1832 he was appointed professor of botany in Tubingen, a post which he never left. Unmarried, his pleasures were in his laboratory and library, and in perfecting optical apparatus and microscopic preparations, for which he showed extraordinary manual skill. He was largely a self-taught botanist from boyhood, and, little influenced in his opinions even by his teachers, preserved always his independence of view on scientific questions. He received many honours during his lifetime, and was elected foreign fellow of the Royal Society in 1851. Von Mohl’s writings cover a period of forty-four years, and of the most notable of them were re-published in 1845 in a volume entitled Vermischte Schriften. (For lists of his works see Botanische Zeitung, 1872, p. 576, and Royal Soc. Catalogue, 1870, vol. iv.) They dealt with a variety of subjects, but chiefly with the structure of the higher forms, including both rough anatomy and minute histology. The word “protoplasm” was his suggestion; the nucleus had already been recognized by R. Brown and others, but von Mohl showed in 1844 that the protoplasm is the source of those movements which at that time excited so much attention. He recognized under the name of “primordial utriculus” the protoplasmic lining of the vacuolated cell, and first described the behaviour of the protoplasm in cell-division. These and other observations led to the overthrow of J. M. Schleiden’s theory of origin of cells by free-cell-formation. His contributions to knowledge of the cell-wall were no less remarkable, he held the view now generally adopted, that the origin of the cell-wall is by apposition, the first well-authenticated case of “true apposition” of walls and the cellular origin of vessels and of fibrous cells; he was, in fact, the true founder of the cell theory.

Clearly the author of such researches was the man to collect into one volume the theory of cell-formation, and this he did in his treatise Die vegetabilische Zelle (1851), a short work translated into English (Ray Society, 1852). Von Mohl’s early investigations on the structure of palms, of cycads, and of tree-ferns permanently laid the foundation of all later knowledge of this subject: so also his work on Isotes (1840). His later anatomical work was chiefly on the stems of dicotyledons and gymnosperms; in his observations on cork and bark he first explained the formation and origin of different types of bark, and corrected errors relating to lenticels. Following on his early demonstration of the origin of stomata (1838), he wrote a classical paper on their opening and closing (1850). In 1843 he started in conjunction with F. Schlechtendal the weekly Botanische Zeitung, which he jointly edited till his death. He was never a great writer of comprehensive works; no textbook exists in his name, and it would indeed appear from his withdrawal from co-operation in W. F. B. Hofmeister’s Handbuch that he had a distaste for such efforts. In his latter years his productive activity fell off, doubtless through failing health, and he died suddenly at Tubingen on the 1st of April 1872.

MOHL, JULIUS VON (1800–1876), German Orientalist, brother of Hugo von Mohl (q.v.), was born at Stuttgart on the 25th of October 1800. Having studied theology at Tubingen (1838–1832), he abandoned the idea of entering the Lutheran ministry, and in 1832 went to Paris, at that time, under Silvestre De Sacy, the great European school of Eastern letters. From 1826 to 1833 he was nominally professor at Tubingen, but had permission to continue his studies abroad, and he passed some years in London and in Oxford. In 1836 he was charged by the French government with the preparation of an edition of the Shih Nama (Libre des rois), the first volume of which appeared in 1838, while the seventh and last was left unfinished at his death, being completed by Barbier de Meynard. Discerning this to be his life’s work, he resigned his chair at Tubingen in 1834, and settled permanently in Paris. In 1844 he was nominated to the academy of inscriptions, and in 1847 he became professor of Persian at the Collège de France. But his knowledge and interest extended to all departments of Oriental learning. He served for many years as secretary, and then as president of the Société Asiatique. His annual reports on Oriental science, presented to the society from 1840 to 1867, and collected after his death in Paris on the 3rd of January 1876, under the title Vingti-sept ans d’histoire des études orientales (Paris, 1879), are an admirable history of the progress of Eastern learning during these years. Concerning the discoveries at Nineveh he wrote Lettres de M. Botta sur les découvertes à Khorsabad (1845). He also published anonymously, in conjunction with Justus Olshausen (1800–1882), Fragments relatifs à la religion de Zoroastre (Paris, 1820); Confucii et Confuciani ex latina P. Lacharmi Interpretatione (Stuttgart, 1830); and an edition of Y-King, Antiquissimum Sinumar liber, ex interpretatione P. Regis (Stuttgart, 1834–1839).

His wife Mary (1793–1883), daughter of Charles Clarke, had passed a great part of her early life in Paris, where she was very intimate with Madame Récamier, before their marriage in 1847, and for nearly forty years her house was one of the most popular intellectual centres in Paris. Madame Mohl’s friends included a large number of Englishmen and Englishwomen. She died in Paris on the 14th of May 1883. Madame Mohl wrote Madame Récamier, with a Sketch of the History of France in Society (London, 1862).

See Kathleen O’Meara, Madame Mohl, her Salon and Friends (1886); and M. C. M. Simpson, Letters and Recollections of Julius and Mary Mohl (1887).

Mohl’s elder brother, ROBERT VON MOHL (1799–1875), was a well-known jurist and statesman. From 1824 to 1845 he was professor of political science at the university of Tubingen, losing his position because of some frank criticisms which brought him under the displeasure of the authorities of Württemberg. In 1847 he was a member of the parliament of Württemberg, and in the same year he was appointed professor of law at Heidelberg; in 1848 he was a member of the German parliament which met at Frankfurt, and for a few months he was minister of justice. His later public life was passed in the service of the grand-duke of Baden, whom he represented as ambassador in Munich from 1867 to 1871. He died in Berlin on the 5th of November 1875. Among his numerous writings may be mentioned, Die deutsche Polizeiwissenschaft nach den Grundsätzen des Rechtstaats (Tubingen, 1832–1834, and again 1860); Geschichte und Literatur der Staatswissenschaften (Erlangen, 1855–1858); Encyclopädie der Staatswissenschaften (Tubingen, 1859, again 1881); and Staatsrecht, Völkerrecht und Politik (Tubingen, 1860–1869).

See Mohl’s own Lebenserinnerungen (Leipzig, 1901); and H. Schulze, Robert von Mohl, Ein Erinnerungsblatt (Heidelberg, 1886).

Another brother, MORITZ VON MOHL (1802–1888), entered official life at an early age and was a member of the Frankfort parliament, and later of the parliament of Württemberg and of the imperial Reichstag. He was a voluminous writer on economic and political questions.

MOHLER, JOHANN ADAM (1796–1838), German theologian, was born at Igersheim in Württemberg on the 6th of May 1796, and after studying philosophy and theology in the lyceum at Ellwangen, entered the university of Tubingen in 1817. Ordained to the priesthood in 1819, he was appointed to a curacy at Riedlingen, but speedily returned as “repetent” to Tubingen,
where he became privy councilor in 1822, extraordinary professor of theology in 1826 and ordinary professor in 1828. His lectures drew large audiences, including many Protestants. The controversies excited by his Symbolik (1839) proved so unpleasant that in 1835 he accepted a call to the university of Munich. In 1838 he was appointed to the deanship of Würzburg, but died shortly afterwards (April 12, 1838).

Möller wrote Die Einheit in der Kirche oder das Prinzip des Katholizismus (Tübingen, 1825); Katharinas der Grosse u. d. Kirche seiner Zeit (2 vols., Mainz, 1827); Symbolik, oder Darstellung der dogmatischen Gegenstände der Katholiken in Deutschland zwischen ihren offensichtlichen Widersprüchen (Mainz, 1835), renewed 1870-72; Eng. trans. by J. B. Robertson, 1831) and Neue Untersuchungen der Lehrgesetze zwischen dem Katholiken u. Protestanten (1834). His Gesammelte Schriften u. Aufsätze were edited by Döllinger in 1839; his Patrologie by Reithmayr, also in 1839; and a Biographie by Kromer was published at Regensburg in 1866. It is with the Symbolik that his name is chiefly associated; the interest excited by it in Protestant circles is shown by the fact that within two years of its appearance it had elicited three replies of considerable importance, those namely of P. C. Baur, P. K. Marbekeine and C. J. Nitsch. But, although characterized by learning and acuteness, as well as by considerable breadth of spiritual sympathy, it cannot be said to have been accepted by Catholics themselves as embodying an accurate reconstruction of the actual character of their liberal school of thought. Of course Möller was a prominent exponent in official circles, while Protestants, on the other hand, complain that the author failed to grasp thoroughly the significance of the development of the Christian spiritual history of mankind, while needlessly dwelling on the doctrinal shortcomings, inconsistencies and contradictions of its leaders.

MOHMAND, a Pathan tribe who inhabit the hilly country to the north-west of Peshawar, in the North-West Frontier Province of India. They are one of the strongest tribes on the border after the Afridis and Waziris, and have given much trouble to the government of India. The country of the Mohmands may be defined roughly as bounded on the E. by British districts from near Jamrud to Fort Abazai, and thence by the Utman Khel country; on the N. by Bajour; on the W. by Kunar; and on the S. by the territories of the Shinwari and Afridi; area, about 1200 sq. m. The Indo-Afghan boundary line now runs through the Mohmand country; but the amir of Afghanistan formerly claimed allegiance from all the Mohmands, and only handed over the greater part of this tract to the British by the Durand Agreement of 1893. The government has given assurances to the Burhan Khel, Duzewai, Halimzai, Isa Khel, Tarakazi and Utmanzai sections of the Mohmands that they will be left by the British to arrange with the Amir of Afghanistan; and these are known as the Assured Clans. The tribe are Afghans by descent, and are more akin to the Yuseafzais than any of their neighbours. The aspect of the Mohmand hills is exceedingly dreary, and the eye is everywhere met by dry ravines between long rows of rocky hills and crags, scantily clothed with coarse grass, scrubwood and the dwarf palm. In summer great want of water is felt, and the desert tracts radiate an intolerable heat. This, coupled with the unhealthy condition of the lowlands, probably accounts for the inferior physique of the Mohmands as compared with their Afridi and Shinwari neighbours, who in summer retire to the cool highlands of Tirah and the Safed Koh. The crops in the Mohmand hills are almost entirely dependent on the winter and autumn rains, and should these fail there is considerable distress; but the Mohmands supplement this source of livelihood by a through trade on rafts along the Kabul river between the British districts and the hill-country beyond them. The exports are rice, hides, ghi and rice from Kunar, and iron from Bajour; the imports are salt, cloth, spices, hemp, tobacco, indigo, gunpowder, negro slaves, and other manufactures of civilization. The Mohmands are characterized by great pride and haughtiness, they bear a bad reputation for treachery and ruthless cruelty, and are not as brave as their Afridi neighbours. They number some 18,000 fighting men, giving roughly a population of 65,000; but all the clans would never act together under any circumstances. British punitive expeditions have been sent against the Mohmands in 1851-52, 1854, 1864, 1879, 1880, but the principal operations were those of 1897.

(T. H. H.)

Campaign of 1897.—The year 1897 witnessed an almost general outbreak among the tribes on the north-west frontier of India. The tribes involved were practically independent, but the new frontier angered with the amir of Afghanistan, and degraded by Sir Robert Durand's commission of 1839-1844, brought them within the British sphere of influence. The great dread of these high-spirited mountaineers was annexation, and the hostility shown during the demarcation led to the Waziri expedition of 1894. Other causes, however, contributed to bring about the outbreak of 1897. The easy victory of the Turks over the Greeks gave rise to excitement throughout the Mahomedan world, and the publication by the amir of Afghanistan, in his assumed capacity of king of Islam, of a religious work, in portions of which fanatical antipathy to Christians was thinly veiled, aroused a warlike spirit among the border Mahomedans. The growing unrest was not recognized, and all appeared quiet, when, on the loth of June 1897, a detachment of Indian troops escorting a British frontier officer was suddenly attacked during the mid-day halt in the Tochi valley, where, since the Waziri expedition of 1894-95, certain armed posts had been retained by the government of India. On the 29th of July, with equal suddenness, the fortified posts at Chakdara and Malakand, in the Swat valley, which had been held since the Chitral expedition of 1895, were attacked on several days fiercely assailed by the usually peaceful Swatis under the officers of the Durand circle. On the 8th of August the village of Shabkadar (Shankargarh), within a few miles of Peshawar, and in British territory, was raided by the Mohmands, while the Afridis besieged the fortified posts on the Samana ridge, which had been maintained since the expeditions of 1888 and 1891. Finally, the Afridis, within a few days, captured all the British posts in the Khyber Pass. A division commanded by Major-General Sir Bindon Blood was assembled at Nowshera. The post at Malakand was reached on the 1st of August, and on the following day Chakdara was relieved. The punishment of the Afridis was deferred till the preparations for the Tirah campaign (see TIRAH) could be completed. The Mohmands, however, could be immediately dealt with, and against them the two brigades of Sir Bindon Blood's division advanced from Malakand simultaneously with the movement of another division under Major-General (afterwards Sir Edmund) R. Elles from Peshawar; it was intended that the two columns should effect a junction in Bajour. About the 6th of September the two forces advanced, and Major-General Blood and Major-General Elles, with about 1400 men, were having detached a brigade to cross the Rambat Pass. This brigade was sharply attacked in camp at Markhania at the foot of the pass on the night of the 14th, was ordered to turn northwards and punish the tribesmen of the Mamund valley. On the 15th Brigadier (afterwards Major-) General Jeffreys camped at Inayat Killa, and on the following day he moved up the Mamund valley in three columns, which met with strong resistance. A retirement was ordered, the tribesmen following, and when darkness fell the general, with a battery and a small escort, was cut off, and with difficulty defended some buildings until relieved. The casualties in this action numbered 149. This partial reverse placed General Blood in a position of some difficulty. He determined, however, to remain at Nawagai, awaiting the arrival of General Ellies, and sent orders to General Jeffreys to prosecute the operations in the Mamund valley. From the 18th to the 23rd these operations were carried on successfully, several villages being burned, and the Mamunds were disheartened. Meanwhile, the camp at Nawagai was heavily attacked on the night of the 19th by a large body of men belonging to the Hadda Mullah's following. The attack was repulsed with a loss of 21, and Generals Blood and Elles met at Lakarai. The junction having been effected, the latter, in accordance with the scheme, advanced to deal with the Upper Mohmands in the Jarobi and Koda Khel valleys, and they were soon brought to reason by his well-conducted operations. The work of the Peshawar division was now accomplished, and it returned to take part in the Tirah campaign. Its total casualties were about 30 killed and wounded. On the 22nd General Blood joined General Jeffreys, and on the 24th he
MOHONK—MOHUR

started with his staff for Panjkorra. On the 27th General Jeffrey's resumed punitive operations in the Mamund valley, destroying numerous villages. On the 30th he encountered strong opposition at Agrah, and had 67 casualties. On the 2nd of October General Blood arrived at Inayat Killa with reinforcements, and on the 11th the Mamunds tendered their submission. The total British loss in the Mamund valley was 282 out of a force which never exceeded 1200 men. After marching into Buner, and revisiting the scenes of the Umbeya expedition of 1863, the Malakand field-force was broken up on the 21st of January. The objects of the expedition were completely attained, in spite of the great natural difficulties of the country. The employment of imperial service troops with the Peshawar column marked a new departure in frontier campaigns.

(C. B.)

MOHONK LAKE, a summer settlement at the northern end of Lake Mohonk, Ulster county, New York, U.S.A., about 14 m. N.W. of Poughkeepsie. It is served from New Paltz, about 1 m. S.E. (about 45 m. by stage), by the Walkill Valley railway, a branch of the West Shore. The lake is a small body of water, picturesquely situated 1245 ft. above the sea level, in the Shawangunk Mountains, (152 ft.), one of the highest peaks of the Shawangunk range. The point of Sky Top lies just east of the south end of the lake; close by, to the west, Eagle Cliff rises to a height of 1442 ft. The development of this beautiful region into a summer resort and the holding of Indian and arbitration conferences here have been due to Albert Keith Smiley (b. 1828), a graduate of Haverford College (1849), who conducted an English and classical academy in Philadelphia in 1853-1857, was principal of the Oak Grove academy at Vassalboro, Maine, in 1858-1866, was principal and superintendent of the Friends' school at Providence, Rhode Island, in 1866-1879, and became a member of the United States Board of Indian Commissioners in 1879. In 1889 he bought, at the northern end of Lake Mohonk, a tract of land on which he built a large hotel. Here, in October 1883, the first Conference of the Friends of the American Indian met; these conferences have since been held annually, their scope being enlarged in 1904 to include consideration of the condition of other dependent peoples—i.e. the natives of the Philippines, Porto Rico and Hawaii. The first conference on instruction in the Indian arts was held here in June 1895.

MOHR, KARL FRIEDRICH (1806-1879), German pharmacist, son of a well-to-do druggist in Coblenz, was born on the 4th of November 1806. Being a delicate child he received much of his early education at home, in great part in his father's laboratory. To this may be traced much of the skill he showed in devising instruments and methods of analysis. At the age of twenty-one he began to study chemistry under Leopold Gmelin, and, after five years spent in Heidelberg, Berlin and Bonn, returned with the degree of Ph.D. to join his father's establishment. On the death of his father in 1840 he succeeded to the business, retiring from it for scientific leisure in 1857. Serious pecuniary losses led him at the age of fifty-seven to become a privadewen in Bonn, where in 1867 he was appointed, by the direct influence of the emperor, extraordinary professor of pharmacy. He died at Bonn on the 28th of September 1879. Mohr was the leading scientific pharmacist of his time in Germany, and he was the author of many improvements in analytical processes. His methods of volumetric analysis were expounded in his Lehrbuch der chemisch-analytischen Titrnmethode (1835), which won the special commendation of Liebig and has run through many editions. His Geschichte der Erde, eine Geologie auf neuer Grundlage (1866), also obtained a wide circulation. In a paper "Über die Natur der Wärme," published in the Zeitschrift für Physik in 1837, he gave one of the earliest general statements of the doctrine of the conservation of energy in the words: "besides the 54 known chemical elements there is in the physical world one agent only, and this is called Krafft (energy). It may appear, according to circumstances, as motion, chemical affinity, cohesion, electricity, light and magnetism; and from any one of these forms it can be transformed into any of the others."

MOHUR, FRIEDRICH (1773-1839), German mineralogist, was born at Gerrode in the Harz Mountains, on the 29th of January 1773. He was educated at Halle, and at the mining academy at Freiburg. He spent much time in Austria in studying mineralogy and mining, and became professor of mineralogy at Graz in 1812. On the death of Werner in 1817, he was appointed to the chair of mineralogy in the mining academy of Freiburg, and in 1826 he became professor of mineralogy and superintendant of the Imperial Cabinet at Vienna. His great work was the Grundriss der Mineralogie (Eng. trans. Treatise on Mineralogy, by Wilhelm Haidinger, 1825). He died at Agardo, near Belluno, Italy, on the 29th of September, 1839.

MOHUN, CHARLES MOHUN, 4th Baron (c. 1675-1712), was the son of the 3rd Baron Mohun, who died in October 1707 as the result of a wound received while acting as second in a duel. The boy had no regular guardian, and before he was seventeen he had earned an unpleasant notoriety in London for rowdism and brawling, had fought a duel and had been tried on a charge of murder. His friend, Captain Richard Hill, a roystering young officer, was in love with the actress Mrs Bracegirdle, and Mohun joined the Will-o'-the-Wisp Club, to become the boy's rival. On the night of the 9th of December 1706, Mohun assisted Hill to attempt the actress's abduction. The attempt failed, and Mohun and Hill then carried Mrs Bracegirdle to her house, and subsequently remained together outside drinking till the appearance of Mountfort, who lived close at hand. There were exchanges between Mohun and Mountfort, and the latter made a disparaging remark about Hill, who either without warning (according to Mountfort's deathbed statement) or in fair fight (according to other evidence) ran Mountfort through the body, and then absconded. Mohun was arrested and put on trial in Westminster Hall before his peers for murder as an accessory before the fact (1693), but by an overwhelming majority the peers found him not guilty. This verdict has been severely criticized, notably by Macaulay, who saw in it merely a gross instance of class favouritism. But a careful examination of the evidence (in the State Trials) justifies the decision, and establishes the presumption that the fight was a fair one. In 1696 Mohun was put on trial for another alleged murder, but was unanimously and quite justly acquitted. His boon companion, Edward Rich, earl of Warwick (1673-1701), who was tried on a separate indictment for the same crime, was found guilty of manslaughter. On this occasion Mohun expressed regret for his past life, and he seems subsequently to have made a genuine attempt to alter his ways and to have taken a practical interest in public affairs. But in 1712 his violent temper again got the better of him, and he forced the 4th duke of Hamilton, with whom he had been at law for some years, into a desperate duel in Hyde Park in the early hours of the 15th of November, in which both combatants were killed. Thackeray has utilized this incident in Esmond. Lord Mohun had no issue, and, on his death the barony, which was created in 1628 in favour of his great-grandfather John Mohun (c. 1592-1640), became extinct.

See The Whole Life and History of My Lord Mohun and the Earl of Warwick (London, 1711); J. Evelyn, Diary and Correspondence; Historical Manuscripts Commission, 11th report, appendix v. (Dartmouth MSS.); G. C. Boase and W. P. Courtenay, Bibliotheca cornubiensis (1874-1882); Howell, State Trials; and Colley Cibber, Apology, edited by R. W. Lowe (1889).

MOHUN, MICHAEL (c. 1652-1684), English actor, played at the Cockpit in Drury Lane before the Civil War. He served on the king's side with credit and was promoted captain, and subsequently, in Flanders, major. At the Restoration he returned with Charles II. and took up his former profession, playing a great variety of parts, usually as second to Charles Hart.

MOHUR, the name of a Persian gold coin, used in India from the 10th century. The word is taken from the Persian mohur, a seal or ring. Between 1835 and 1840 a gold coin, also called a "mohur," was struck by the government of British India and was of the nominal value of 15 rupees. On the establishment of a gold standard in India in 1899, on the basis of 16d. a rupee,
the British sovereign was declared legal tender and the morum
was thus superseded.

MOORE (a corruption of the Portuguese moeda d'ouro,
literally, money of gold), the name of a gold Portuguese coin,
coined from 1640 to 1732. This was of the sterl|ng value of
135. 53d. It is the double moeda d'ouro, of the value of 4800
reis in 1688, that was current in western Europe and the West
Indies for a long period after it ceased to be struck. It was
the principal coin current in Ireland at the beginnin|ng of the
18th century, and spread to the west of England. At the same
time it was current in the West Indies, particularly in Barbados.
It was rated in English money at 275.

MOIR, DAVID MACBETH (1798-1837), Scottish physician
and writer, was born at Musselburgh on the 5th of January
1798. He studied medicine at Edinburgh University, taking his
degree in 1816. Entering into partnership with a Musselburgh
doctor he practised there until his death on the 6th of July 1851.
He was a contributor of both prose and verse to the magazines,
and particularly, with the signature of "Delta," to Blackwood's.
A collection of his poetry was edited in 1852 by Thomas Aird.
Among his publications were the famous Life of Mansie Wauch,
Tailor (1828), which shows his gifts as a humorist, Outlines
of the Ancient History of Medicine (1831), and Sketch of the
Poetical Literature of the Past Half Century (1851).

MOISSAC, a town of south-western France, capital of an
arrondissement in the department of Tarn-et-Garonne, 17 m.
W.N.W. of Montauban on the Southern railway between
Bordeaux and Toulouse. Pop. (1906) town, 4523; commune,
8218. Moissac stands at the foot of vine-clad hills on the
right bank of the Tarn; it is divided into two parts by the lateral
channel of the Garonne, which crosses the Tarn by way of an
aqueduct a short distance above the town. It contains little
of note except the abbey-church of St Pierre, a building of the
13th century with a porch of the 12th century which is decorated
with elaborate Romanesque carving unsurpassed in France.
Immediately adjoining the procession the west side of the church is also one of the finest of its kind. Romanesque
in character, it has pointed arches resting alternately on single
and clustered columns with sculptured capitals. Among other
remains of the abbey is the abbess's palace, which contains two
halls of the Romanesque period. St Martin, the oldest of the
other churches of Moissac, dates from before the year 1000.
The town has a sub-prefecture, a tribunal of first instance,
a communal college for boys, a library and a museum.
Trade is in oil, wine, eggs, wool, poultry and fruit (peaches,
apricots, &c.).
The town owes its origin to an abbey probably founded in the
7th century by St Amand, the friend of Dagobert. After being
devastated by the Saracens, the abbey was restored by Louis
of Aquitaine, son of Charlemagne. Subsequently it was made
dependent on Cluny, but in 1618 it was secularized by Pope
Paul V., and replaced by a house of Augustinian monks, which
was suppressed at the Revolution. The town, which was
erected into a commune in the 13th century, was taken by
Richard Cœur de Lion and by Simon de Montfort.

MOISSAN, HENRI (1852-1907), French chemist, was born at
Paris on the 28th of September 1852. Educated at the Museum
of Natural History, he was successively professor of toxicology
(1886) and of inorganic chemistry (1889) at the School of Phar-
macy, and of general chemistry at the Sorbonne (1900). In
1886 he succeeded in obtaining the element fluorine in the free
state by the electrolysis of potassium fluoride and anhydrous
hydrofluoric acid at a low temperature. Thence he led to
study the production of carbon in its three varieties and to
attempt the artificial preparation of diamond, of which he was
able to make some minute specimens (see GEMS, § Artificial).
In connexion with these experiments he developed the electric
furnace as a convenient means of obtaining very high tempera-
tures in the laboratory; and by its aid he prepared many new
compounds, especially carbides, silicides and borides, and
melted and volatilized substances which had previously been
regarded as insusible. For his preparation of fluorine he was
awarded the Lacsac prize in 1887, and in 1906 he obtained the
Nobel prize for chemistry. He died in Paris on the 20th of
February 1907.

His published works include Le four électrique (1897), and Le flor
et ses composés (1900), besides numerous papers in the Comptes
rendus and other scientific periodicals. A Traité de chimie minérale
in five volumes was published under his direction in 1904-1906.

MOJI, a town of Japan, on the Kiushiu side of the Shimonoseki
Strait. The strait being only 1 m. in width, Moji and Shimonomori would be practically the same port did not the
swiftness of the current along the latter shore make it con-
venient for vessels to anchor off Moji. Moji is one of the places
voluntarily opened by the Japanese for purposes of direct
export. It is the starting-point of the Kiushiu railway, and as
there is abundance of coal in its neighbourhood, it has become
a town of considerable importance. In 1890 it was little more
than a hamlet, but it had in 1901 a population of 25,774,
and a considerable foreign trade.

MOISIUS VON MOJSVAR, JOHANN AUGUST GEORG
EDMUND (1739-1807), Austro-Hungarian geologist and paleo-
ontologist, son of the surgeon Georg Mojsivos von Mojsvar
(1799-1860), was born at Vienna on the 18th of October 1739.
He studied law in Vienna University, taking his doctor's degree
in 1846, and in 1867 he entered the Geological Institute, becom-
ing chief geologist in 1870 and vice-director in 1882. He retired
in 1900, and died at Mallnitz on the 2nd of October 1907. He
paid special attention to the cephalopoda of the Austrian Trias,
and his publications include Das Gebirge um Hallstatt (1873-
1876); Die Dolomitrisse von Sttirol und Venetien (1873-1880);
Grundlinien der Geologie von Bosnien-Herzegovina (1880) with
E. Tietze and A. Bittner; Die Cephalopoden der mediterranen
Triasprovinz (1882); Die cephalopoden der Hallstätter Kalkte
(1873-1903); and Beiträge zur Kenntnis der oberdevicitischen
Cephalopodenfaunen des Himalaya (1896). With Melchior
Neumayr (1845-1860) he conducted the Beiträge zur Polon-
ologie und Geologie Oesterreich-Ungarns. In 1862, with Paul
Grohmann and Dr Guido von Sommaruga, he founded the
Austrian Alpine Club, and he also took part in establishing the
German Alpine Club, which combined with the former in 1873.

MOKANNA (al-Mokanna‘), the Veiled), the name given to
Hakim, or 'Ata, a man of unknown parentage, originally a
fuller in Merv, who posed as an incarnation of Deity, and headed
a revolt in Khorassan against the caliph Mahdi. For about three
years he sustained himself in the field against the troops of the
caliph and for two years longer in his fortress of Saman; then,
reduced to straits in 770, he and his followers took poison and
set fire to the fortress. Much is related to his magical arts, espe-
cially of a moonlike light visible for an enormous distance
which he made to rise from a pit near Nakhashb. He is the
hero of the first part of Moore's Lalla Rookh.

MOKHA (Mocha, properly Makha), a town in Arabia on the
Red Sea coast in 13°16' N. and 43°12' E. Formerly the chiefport
for the Yemen coffee export, it has much diminished in im-
portance. The cffee grown in the mountain districts of Haraz,
Uden, and Ta'iz is now shipped at Hodeida or Aden, though the
article retains the trade name of "Mocha." The town lies in
a small bay 40 m. N. of Perim at the southern entrance to the
Red Sea. The anchorage is not good, and the port is only used
by native vessels. Seen from the sea the town has rather an
imposing appearance, but a near review shows that the houses
though large and built of stone are mostly in ruins. The
neighbouring country is an arid plain without fresh water, the
town being supplied by an aqueduct from the village of Muza,
situated 16 m. to the east. This is probably identical with the
Muxa of the Periplus, a great seat of the Red Sea trade in
antiquity, which like Betel Fakah, Zubed and other old Tehama
towns, formerly seaports, has long since been left by the reced-
ing sea. There is a Turkish kaimakam and a small garrison at
Mokha, which is part of the civil district of Taiz in the vilayet
of Yemen.

MOKSHANY, a town of Russia, in the government of Penza,
24 m. N.W. of the city of Penza. Pop. (1900), 10,710. The
inhabitants are engaged in agriculture, or work in flour-mills, oilworks, tanneries, and potash-works. Mokshany, which was built in 1535 as a fort to protect the country from the raids of the Tatars and the Kalmecks, is supposed to occupy the site of the Meshchery town of Murunza; mentioned as early as the 9th century at the mouth of the Don.

MOLASSES, the syrup obtained from the drainings of raw sugar or from sugar during the process of refining. In American usage the word usually applies to both forms of the syrup, but in English usage the second form is more usually known as "treacle" (see Sugar). The word, which in early forms appears as melasses, molasses, &c., is from the Port. melaço, or Fr. melasse, cf. the Late Lat. mellaceum, syrup made from honey (mea). The geological term "molasse" must be distinguished; this word, applied to the soft greenish sandstone of the district between the Jura and the Alps, is French, meaning "soft," Lat. mollis.

MOLAY, Jacques de (d. 1314), last grand master of the Knights Templars, was born of a noble but impoverished family, at a village of the same name in the old province of Franche-Comté (mod. department of Haute-Saône), about mid-way in the 13th century. His parents were members of the family of Molay, the inheritance of which passed to Jean, Jacques was thrown upon his own resources. Having been brought up in the neighbourhood of a commandery of the Temple, he entered the order in 1265 at Beaune in the diocese of Autun. It is probable that he at once set out for the East to take part in the defence of the Holy Land against the Saracens. About 1295 he was elected grand master of the order. After the Templars had been driven out of Palestine by the Saracens, De Molay took refuge with the remnant of his followers in the island of Cyprus. Here, while attempting to get together a force to retrieve the disasters to the Christian arms, he received a summons (in 1306) from Pope Clement V. to repair to Paris. The pope's pretext for the summons was his desire to put an end to the quarrels between the Templars and the Knights of St John, and to concert plans for a new crusade; in reality he had entered into a secret agreement with the king of France for the suppression of the Templars. Molay left Cyprus with a retinue of 60 followers, and made a triumphal entry into Paris, 13th of October 1307. Every Templar in France was arrested, and a prolonged examination in the matter of the order was held. De Molay, probably under torture, confessed that some of the charges brought against the order were true. He was kept in prison for several years, and in 1314 he was brought up with three other dignitaries of the Temple before a commission of cardinals and others to hear the sentence (imprisonment for life) pronounced. Then, to the surprise of the commission, De Molay withdrew his confession. Immediately the king heard of it he gave orders that De Molay and another of the four, who had also recanted, should be burnt as lapsed heretics. The sentence was carried out on the 11th (or 19th) of March 1314. De Molay's ashes were gathered up by the people, and it is said that with his last breath he summoned the king and the pope to appear with him before the throne of God.

For the charges brought against the Templars and the famous process in connexion with them, see Templars: I. Michelet, Proces des Templiers (1841-1851) and Lavocat, Proces des frères et de l'ordre du Temple d'après les pièces inédites publiées par M. Michelet (1888); E. Besnier, Étude sur Jacques de Molay in Mémoires de la soc. d'émulation du Deut (1880); M. H. P. Mullin, Hist. of Latin Christianity, bk. xii., chs. 1 and 2; H. Prutz, Entdeckung und Unfortgang des Templerkriegs (1888).

MOLD (formerly Mould, Welsh Y Wyydgrug, a conspicuous barrow, Lat. Mons altus, the translation of the Welsh name), a market town, contributory parliamentary borough of Flintshire, N. Wales; on the London & North-Western railway (Chester and Denbigh branch), 182 m. from London and 11 m. from Chester. Pop. of urban district (1901), 4263. The locality is populous owing to the collieries and lead-smelting works in the vicinity. At the north end of the town there is a height, Bailey Hill (perhaps from bally, the architectural term applied to fortified castle courts). This hill, partly natural and partly artificial, was once the site of a Roman fortification, and in old records is known as Mouldes, Monhault, or Monhault (de monte alto). Mold Castle was probably built by Robert Monhault (alias William Rufus), was taken and destroyed by Owen Gwynedd in 1144-1145, its site lost to the English and retaken by Llewelyn ap Iowerth in 1201, and by Gruffydd Llyw in 1322. On this site, too, where there are now no remains of any fortress, were found, in 1840, some 15 skeletons, supposed to be of the 13th or 14th centuries. Maes Garmon (the battlefield of Germanus) is about a mile west of Mold. Here, in 1745, the "Alleluia Victory" was gained over the Picts and Scots by Lupus and Germanus, bishop of Auxerre, according to some about A.D. 430, but others give A.D. 448, the date of the saint's death. A commemorative obelisk was erected on the Maes by N. Griffin of Rhual (1736). Over a mile south of Mold, on the right of the road to Nercis, is the "Tower." (15th century, but perhaps restored in the 16th), where, in 1465 or 1475, the royal chieftain, Rheinfalt, son of Gryuffyd ab Bleddyn, hanged Robert Byrne, mayor of Chester, and subsequently burned alive some 200 Chester folk who tried to arrest him. Many tumuli are visible round Mold.

Mold county, in 1886 bought by Jesuits expelled from France, was by them named St Germanus's House. St Mary's church, a Gothic building, is mentioned as early as the time of Henry VII. Its important collieries and lead mines; fire-brick, tile, earthenware, mineral oil, tinplate and nail manufactures, tanneries, breweries and malt-houses, have made Mold the business centre of the county. About 5 m. distant is Cîcain village, of which the church has a carved oak roof, stolen from Basingwerk Abbey at the dissolution of the monasteries. Among the neighbouring Clwyd hills Moel Famau and Moel Arthur are specially noticeable. On the summit of the former is George III. 's jubilee pyramid. The Ordovices and the Romans fortified Moel Arthur. The sites of seven posts established against Rome may be traced along the hills bounding Flintshire and Denbighshire.

MOLDAVIA, a former principality of south-eastern Europe, constituting, after its union with Wallachia on the 9th of November 1859, a part of Rumania (q.v.).

Moldavia, an olive-green or dull greenish vitrue substance, named by A. Dufreny from Moldauthen in Bohemia, where it occurs. It is sometimes cut and polished as an ornamental stone under the name of pseudo-chrysolite. Its btle-glass colour led to its being commonly called Bouteilienstein, and at one time it was regarded as an artificial product, but this view is opposed to the fact that no remains of glass-works are found in the neighbourhood of its occurrence: moreover pieces of the substance are widely distributed in Tertiary and early Pleistocene deposits in Bohemia and Moravia. For a long time it was generally believed to be a variety of obsidian, but its difficult fusibility and its chemical composition are rather against its volcanic origin. Dr F. E. Suess pointed out that the nodules or small masses of moldavite presented curious pittings and wrinkles on the surface, which could not be due to the action of water, but resembled the characteristic markings on many meteorites. Boldly attributing the material to a cosmic origin, he regarded moldavite as a special type of meteorite for which he proposed the name of tektite (lunar glass). To this type are also referred the so-called esbian bombs and buttons from Australia and Tasmania, known sometimes as australite, and called by R. H. Walmcott obsidians. Similar bodies have been found in Malaysia and have been termed billitonite, from the isle of Billiton where they occur in tin-bearing gravels. Usually they are flat, rounded or elliptical bodies, sometimes surrounded by an equatorial girdle or rim, and often with a brilliant black superficial lustre, as though varnished. Moldavite has been reported also from Scania in Sweden.

See Franz E. Suess, Jahrbuch der k.-k. geolog. Reichsanstalt (Vienna), 1901, p. 193; E. Weinschenk, Centrablatt f. Mineralogie (Stuttgart), 1908, p. 737.

MOLDE, a small seaside town of Norway, in Romsdal amt (county), 304 m. by sea N.N.E. of Bergen, in 6° 45' N. (that
of the Faroe Islands). It has little trade, but is the principal tourist centre on this part of the coast, and the steamers from Hull and Newcastle, the Norwegian ports, Hamburg, Antwerp, &c., call here. The town fronts the broad Molé Fjord, with its long low islands, and to the east and south a splendid panorama of jagged mountains is seen, reaching 610 ft. in Store Trolfjorder of the Romsdal group. Molé is the port for the tourist route through the Romsdal.

MOLÉ, LOUIS MATHIEU, COMTE (1781-1835). French statesman, was born in Paris on the 24th of January 1781. His father, a president of the parlement of Paris, who came of the family of the famous president noticed below, was guillotined during the Terror, and Count Molé's early days were spent in Switzerland and in England with his mother, a relative of Lamoignon-Malebranche. On his return to France he studied at the école centrale des travaux publics, and his social education was accomplished in the salon of Pauline de Beaumont, the friend of Chateaubriand and Joubert. A volume of Éssais de morale et de politique introduced him to the notice of Napoleon, who attached him to the staff of the council of state. He became master of requests in 1806, and next year prefect of the Côte d'Or, counsellor of state and director-general of bridges and roads in 1809, and count of the empire in the autumn of the same year. In November 1813 he became minister of justice. Although he resumed his functions as director-general during the Hundred Days, he excused himself from taking his seat in the council of state, and soon went to London as ambassador to Sweden. On his return from Stockholm he was appointed director-general of the army and military works, and was afterwards sent as minister plenipotentiary to the peace conference at the Hague. For Louis XVIII confirmed his appointment as director-general and made him a peer of France. Molé supported the policy of the duc de Richelieu, who in 1817 entrusted to him the direction of the ministry of marine, which he held until December 1819. From that time he belonged to the moderate opposition, and he accepted the result of the revolution of 1830 without enthusiasm. He was minister for foreign affairs in the first cabinet of Louis Philippe's reign, and was confronted with the task of reconciling the European powers to the change of government. The real direction of foreign affairs, however, lay less in his hands than in those of Talleyrand, who had gone to London as the ambassador of the new king. After a few months of office Molé retired, and it was not until 1836 that the fall of Thiers led to his becoming prime minister of a new government, in which he held the portfolio of foreign affairs. One of his first acts was the release of the ex-ministers of Charles X., and he had to deal with the disputes with Switzerland and with the Strasbourg coup of Louis Napoleon. He withdrew the French garrison from Ancona, but pursued an active policy in Mexico and in Algeria. Personal and political differences rapidly arose between Molé and his chief colleague Guizot, and led to an open rupture in March 1837 in face of the general opposition to a grant to the duc de Nemours. After some attempts to secure a new combination Molé reconstructed his ministry in April, Guizot being excluded. The general election in the autumn gave him no fresh support in the Chamber of Deputies, while he had now to face a formidable coalition between Guizot, the Left Centre under Thiers, and politicians of the Dynastic Left and the Republican Left. Molé, supported by Louis Philippe, held his ground against the general hostility until the beginning of 1839, when, after acrid discussions on the address, the chamber was dissolved. The new house showed little change in the strength of parties, but Molé resigned on the 31st of March 1839. A year later he entered the Academy, and though he continued to speak frequently he took no important share in party politics. Louis Philippe sought his help in his vain efforts to form a ministry in February 1848. After the revolution he was deputy for the Gironde to the Constituent Assembly, and in 1849 to the Legislative Assembly, where he was one of the leaders of the Right until the coup d'État on the 2nd of December 1851 drove him from public life. He died at Champâtreux (Seine-et-Oise) on the 23rd of November 1855.

See P. Thureau-Dangin, Histoire de la monarchie de juillet (1884-1892); and Robert Cougny, Dict. des parlementaires français (1891).

MOLÉ, L. M.—MOLE

MOLÉ, L. M. (1584-1656), French statesman, son of Edouard Molé (d. 1614), who was for a time procureur-général, was educated at the university of Orleans. Admitted conseiller in 1606, he was président aux requêtes in 1610, procureur-général in succession to Nicolas de Bellèvre in 1614, and he took part in the assembly of the Notables summoned to Rouen in 1617. He fought in vain against the setting up of special tribunals, or commissions, to try prisoners charged with political offences, and for his persistence in the case of the brothers Louis and Michel de Marillac he was suspended in 1631, and ordered to appear at Fontainebleau in his own defence. Hitherto Molé's relations with Richelieu had been fairly good, but his inclination to the doctrines of Port Royal increased the differences between them, and it was not until after Richelieu's death that he was able to secure the release of his friend, the abbé de St Cyran. In 1641 he was appointed first president of the parlement, with the preliminary condition that he should not permit the general assembly of the chambers except by express order of the king. After Richelieu's death the pretensions of the parlement increased; the hereditary magistrature arrogated to itself the functions of the states-general, and in 1648 the parlement with the other sovereign courts (the cour des aides, the grand conseil, and the cour des comptes) met in one assembly and proposed for the royal sanction twenty-seven articles, which amounted in substance to a new constitution. In the long conflict between Anne of Austria and the parlement, Molé, with the objects of the parlement, played a conciliatory part. In the popular tumult known as the day of the barricades (Aug. 26, 1648) he sought out Mazarin and the queen to demand the release of Pierre Brousselle and his colleagues, whose seizure had been the original cause of the outbreak. Next day the parlement marched in procession to remonstrate on Molé's demand. On their way back they were stopped by the crowd. "Turn, traitor," said one of the rebels to Molé, seizing him by the beard, "and unless you wish to be massacred, either bring back Brousselle, or bring Mazarin as a hostage." Many magistrates fled; the remnant, headed by the intrepid Molé, returned to the Palais Royal, where Anne of Austria was induced to release the prisoners.

Molé's moderating counsels failed to prevent the outbreak of the first Fronde, but he negotiated the peace of Rueil in 1651, and averted a conflict between the partisans of Condé and of the Cardinal de Retz within the deliberations of the parlement. He refused honours and rewards for himself or his family, but became keeper of the seals, in which capacity he was compelled to follow the court, and he therefore retired from the presidency of the parlement. He died on the 3rd of January 1656.

The Mémoires of Molé were edited for the Société de l'histoire de France (4 vols., 1859) by Aimé Champonillon-Figeac, and his life was written by Baron A. G. P. de Barante in Le Parlement et la Fronde (1859). See also the memoirs of Omer Talon and of De Retz.

MOLE.

(1) A small animal of the family Talpidae (see below).
(2) A mark, or stain, and particularly a dark-coloured raised spot on the human skin. This word, O. Eng. môle, appears in such forms as meil or mail, in old forms of Teutonic languages, and in mal, a sign; cf. Ger. Denkmal, a monument. It is probably cognate with Lat. maculus, spots. Its meaning of stain is seen in the corrupted form "iron-mould," properly "iron-mole," a stain produced on linen or cloth by rust or ink.
(3) A large structure of rubble, stone or other material, used as a breakwater or pier (see Breakwater), or the space of water so enclosed, forming a harbour or anchorage. This word comes through the French from Lat. moles, a mass, large structure. The name of the "Mole of Hadrian" (moles Hadriani) is sometimes given to the mausoleum of that emperor, now the castle of St Angelo at Rome.

In zoology the name of mole (a contracted form of mould-warp, i.e. mould-caster), is properly applicable to the common mole (Talpa europaea), a small, soft-furred, burrowing mammal, with minute eyes, and broad fossorial fore-feet, belonging to the order Insectivora and the family Talpidae. In a wider sense may be included under the same term the other Old World moles, the North American star-nosed and other moles, and the
MOLeCLE

African golden moles of the family Chrysochloridae. In a still wider sense the name is applied to the Asiant zokors and the African strand-moles, belonging to the order Rodentia, as well as to the Australian paludice, or water polecat.

The common mole is an animal about six inches in length, with a tail of one inch. The body is long and cylindrical, and, owing to the forward position of the front limbs, the head appears to rest between the shoulders; the muzzle is long and obtusely pointed, terminated by the nostrils, which are close together in front; the minute eye is almost hidden by the fur; the ear is without a conch, opening on a level with the surrounding skin; the fore-limbs are rather short and very muscular, terminating in broad, naked, shovel-shaped feet, the palms normally directed outwards, each with five sub-equal digits armed with strong flattened claws; the hind-feet, on the contrary, are long and narrow; and the toes are provided with slender claws. The body is densely covered with soft, erect, velvety fur—the hairs uniform in length and thickness, except on the muzzle and short tail, the former having some straight bristles on its sides, whilst the latter is clothed with longer and coarser hairs. The fur is generally black, with a more or less greyish tinge, or brownish-black, but various paler shades up to pure white have been observed.

The food of the mole consists chiefly of earthworms, in pursuit of which it forms its well-known underground excavations. The mole is one of the most voracious of mammals, and, if deprived of food, is said to succumb in from ten to twelve hours. Almost any kind of flesh is eagerly devoured by captive moles, which have been seen, as if maddened by hunger, to attack animals nearly as large as themselves, such as birds, lizards, frogs, and even snakes; toads, however, they will not touch, and no form of vegetable food attracts their notice. If two moles be confined together without food, the weaker is invariably devoured by the stronger. Moles take readily to the water—in this respect, as well as in external form, resembling their North American representatives. Bruce, writing in 1793, remarks that he saw a mole paddling towards a small island in the Loch of Clunie, 380 yds. from land, on which he noticed molehills. The sexes come together about the second week in March, and the young—generally from four to six in number—which are brought forth in about six weeks, quickly attain their full size.

Much misconception has prevailed with regard to the structure of the mole's "fortress," i.e. the large breeding hillock, which is generally placed in bushes, or amid the roots of a tree; but a trustworthy account, by Mr L. E. Adams, will be found in the Memoirs of the Manchester Literary and Philosophical Society for 1903, vol. xlii.

The geographical distribution of the mole exceeds that of all the other species of the genus taken together. It extends from England to Japan, and from the Dovre-Fjeld Mountains in Scandinavia and the Middle Dvina region in Russia to southern Europe and the southern slopes of the Himalaya, where it occurs at an elevation of 10,000 ft. In Great Britain it is found as far north as Caithness, but in Ireland and in the Western Isles of Scotland (except Mull) it is unknown. (See INSECTIVORA.)

Molecule (from mod. Lat. molecula, the diminutive of mole, a mass), in chemistry and physics, the minutest particle of matter capable of separation without decomposition. The word "molecule" was first used in chemistry during the 17th century, and remained synonymous with "atom" (Gr. ἀράμος, from α-, privative, and τιμέω, to cut) until the middle of the 19th century, when a differentiation was established. "Atom" has mainly a chemical import, being defined as the smallest particle of matter which can take part in a chemical reaction; a "molecule" is composed of atoms, generally two or more. For the detailed chemical significance of these terms, see CHEMISTRY; and for the atomic theory of the chemist (as distinguished from the atomic or molecular theory of the physicist) see ATOM; reference may also be made to the article MATTER.

The doctrine that matter can be divided into, or regarded as composed of, discrete particles (termed "atoms") by early writers, and "molecules" by modern ones, has at all times played an important part in metaphysics and natural science. The leading historical stages in the evolution of the modern conception of the molecular structure of matter are treated in the following passage from James Clerk Maxwell's article ATOM in the 8th edition of the Encyc. Brit.

"Atom" (Gr. ἀράμος) is a body which cannot be cut in two. The atomic theory is a theory of the constitution of bodies which asserts that they are made up of atoms. The opposite theory is that of the homogeneity and continuity of bodies, and asserts, at least in the case of bodies having no apparent organization, such, for instance, as water, that as we can divide a drop of water into two parts which are each a drop of water, so may we divide them into smaller and smaller parts, until these smaller drops can be divided again, and the theory goes on to assert that there is nothing in the nature of things to hinder this process of division from being repeated over and over again, times without number. The theory of the constitutioin of bodies is that of the divisibility of bodies, and it is in direct contradiction with the theory of atoms.

The atomists assert that after a certain number of such divisions the parts would be no longer divisible, because of their smallness; they even assert that if we made the time of division as small as we please and the smallest conceivable body has parts, and that whatever has parts may be divided.

In ancient times Democritus was the founder of the atomic theory. He supposed that all bodies are made up of "atomas" or small indivisible particles, and these he identified with the "atom" or indivisible body, a notion of the name of the doctrine of homoeomeria (αὐτομα, or of the similarity of the parts of a body to the whole. The arguments of the atomists, and their replies to the objections of Anaxagoras, are to be found in Hellenistic philosophy.

"In modern times the study of nature has brought to light many properties of bodies which appear to depend on the magnitude and motions of their ultimate constituents, and the question of the existence of atoms has once more become conspicuous among scientific inquiries.

"We shall begin by stating the opposing doctrines of atoms and of continuity. The most ancient philosophers whose speculations are known to us seem to have discussed the ideas of number and of continuity with equal magnitude, and at times of matter, and of motion which with a native power of thought which has probably never been surpassed. Their actual knowledge, however, and their scientific experience were necessarily limited, because in their days the records of human thought were by no means so exact as they are in the present day, and the difference is that the exact examination of the properties of number. It is by the help of numbers that concrete quantities are practically measured and calculated. Now, number does not exist as a thing in itself, but is a magnitude, the magnitudes, on the other hand, which we meet with in geometry, are essentially continuous. The attempt to apply numerical methods to the comparison of geometrical quantities led to the doctrine of incommensurability, and to that of the indivisibility of magnitudes. Meanwhile, the same considerations had not been applied to time, so that in the days of Zeno of Elea time was still regarded as made up of a finite number of 'moments,' while space was confessed to be divisible. We are in the same position as the Great Sages of the ancient world, who with their celebrated arguments against the possibility of motion, of which that of Achilles and the tortoise is a specimen, were propounded by Zeno, and such, apparently, continued to be the state of opinion till the end of the eighteenth century. Yet it is evident that the fundamental properties of motion (space, time, mass) are precisely the same sense that space is. And the slowness of the development of scientific ideas may be estimated from the fact that Bayle does not see any force in this statement of Aristotle, but continues to admire the paradoxes of Zeno (Bayle's Dictionary, art. 'Zeno'). Thus the direction of true scientific progress was for many ages towards the recognition of the indivisibility of space and time.

"It was easy to attempt to apply similar arguments to matter. If matter is extended and fills space, the same mental operation by which we recognize the divisibility of space may be applied, in imagination, to the matter which occupies space. From this point of view the atomic doctrine might be regarded as a relic of the old numerical way of conceiving magnitude, and the opposite doctrine of the indivisibility of matter might appear for a time the most scientific. The atomists, on the other hand, asserted very strongly the distinction between matter and space. The atoms, they held, do not fill space, or occupy the motion of body which adheres to them. If they were not so, Lucretius tells us, there could be no motion, for the atom which gives way first must have some empty place to move into.

"Qua praeter locus est intactus, inane, vacansque
Quod si non esset, nullus ratione moveri
Res posset; namque, officium quod corporis existat,
Officere attque obstat, id in omni tempore adesse
Omnibus: hau du rigor quicquid procedure posset,
Principium quoniam cedendi nulla specie est.

De rerum natura: i. 335.

1 It will be noted that Clerk Maxwell's "atom" and "atomic theory" have the significance which we now attach to "molecule" and "molecular theory."
that there is no vacuum—that every part of space is full of matter, that there is a universal pelvis, and that all motion is like that of a fish in the water, which yields at the instant of its death from the fish's leaves room for it behind.

**Cedre squamigeris laeves atenuobus aiunt**

*Et quae sequi dixit, quia post loca quae Linquant, quo possint cedentes confundae unde.*

*Ibid. i. 373.

"In modern times Descartes held that, as it is of the essence of matter to be extended in length, breadth and thickness, so it is of the essence of extension to be occupied by matter, for extension cannot be an exception of nothing."

"Ac proinde si quateram quid fieri, si Deus auferat omne corpus quod in aliquo vase continetur, et nullum aliud in ablaci locum veniretur, non potest esse aliquid principio aliorum, nisi ipsoipsa continetur. Cum enim inter duo corporea nihil interjacet, necesse est ut se mutuo tangant, ac manifeste repugnat ut distant, ut ipsa ipsa sit distantia, et tamen ut distantia sit nihil; quae distantia sit indivisa."

"Thus, in Boscovich's theory, the atom has continuity of existence in time and space. At any instant of time it is at some point of space, and it is never in more than one place at a time. It passes from one place to another along a continuous path. It has a definite mass which cannot be increased or diminished. Atoms are endowed with the power of acting on one another by attraction or repulsion, the amount of the force depending on the distance between them. On the other hand, the atom itself has no parts or dimensions. In its intrinsic and potential aspect it is a body with only geometrical properties, with no extension in space. It has not the so-called property, of Impenetrability, for two atoms may exist in the same place. This we may regard as one extreme of the various opinions about the constitution of matter."

"The opposite extreme, that of Anaxagoras—the theory that bodies apparently homogeneous and continuous are so in reality—is, in its extreme form, a theory incapable of development. To explain the properties of bodies by means of this theory is impossible. We can only admit the observed properties of such substances as ultimate facts. There is a certain stage, however, of scientific progress in which a method corresponding to this theory is of service. In physics, as a matter of fact, we define a fluid by means of one of its known properties, and from this definition we deduce a system of deductions which constitutes the science of hydrostatics. In this way the science of hydrostatics may be built upon an experience, without any consideration of the constitution of a fluid as to whether it is molecular or otherwise. In like manner, after the French mathematicians had attempted, with more or less inutility, to construct a theory of elastic solids from the hypothesis that they consist of atoms in equilibrium under the action of their mutual repulsions, it was shown by Stokes that the phenomena of hydromechanics may be reduced to the method of the sciences of fluxions. The term may be applied to the application of problems connected with material bodies by assuming them, for the purpose of this analysis, to be composed of indivisible particles. Thus, the results applicable to the real case is that the smallest portions of the substance of which we take any notice shall be sensibly homogeneous.

Thus, if a railway contractor has to make a tunnel through a hill of gravel, the one at the top, for instance, may be divided into particles, each of which is in a state of atomic existence, to be treated as homogeneous and continuous.

"In the same way, a theory that some particular substance, say water, is homogeneous and continuous may be a good working theory up to a certain point, but may fail when we come to deal with quantities so minute or so extensive that the theory of structure comes into prominence. Whether this heterogeneity of structure is or is not consistent with homogeneity and continuity of atoms is another and a new question."

The extreme form of the doctrine of continuity is that stated by Descartes, who maintains that the whole universe is equally full of matter, and that this matter is all of one kind, having no essential properties besides its quantity and extension. All the properties which we perceive in matter he reduces to the product of two or more substances, one another, and so capable of all the varieties which we can perceive to follow from the motion of its parts (Principia, ii. 23). Descartes's method seems to deduce the different qualities and actions of bodies in this way, and he reduces all the phenomena to the single cause of the continuous action of the bodies. In this way Boscovich explained the apparent extension of bodies consisting of atoms, each of which is devoid of extension. According to Boscovich's theory, all action between bodies is at a distance, there being no such thing in nature as actual contact between two bodies. When two bodies are said in ordinary language to be in contact, all that is meant is that they are so near together that the repulsion between the nearest pairs of atoms belonging to the two bodies is considerable."

The Molecular Structure of Matter

An enormous mass of experimental evidence now shows quite conclusively that matter cannot be regarded as having a continuous structure, but that it is ultimately composed of discrete parts. The smallest unit of matter with which physical phenomena are concerned is the molecule. When chemical phenomena occur the molecule may be divided into atoms, and these atoms, in the presence of electrical phenomena, may themselves be further divided into electrons or corpuscles. It ought accordingly to be possible to explain all the non-electrical and non-chemical properties of matter by treating matter as an aggregation of molecules. In point of fact it is found that the properties which are most easily explained are those connected with the gaseous state; the explanation of these properties is the basis of the molecular structure of matter is the aim of the "Kinetic Theory of Gases." The results of this theory have placed the molecular
conception of matter in an indisputable position, but even without this theory there is such an accumulation of electrical and optical evidence in favour of the molecular conception of matter that the tenability of this conception could not be regarded as open to question.

The Scale of Molecular Structure.—Apart from speculation, the first definite evidence for the molecular structure of matter occurs when it is found that certain physical phenomena change their whole nature as soon as we deal with matter of which the linear dimensions are less than a certain amount. As a single instance of this may be mentioned some experiments of Lord Rayleigh (Proc. Roy. Soc., 1890, 47, p. 364), who found that a film of olive oil spread over the surface of water produced a perceptible effect on small floating pieces of camphor, at places at which the thickness of the film was 6-6×10⁻⁸ cms., but produced no perceptible effect at all at places where the thickness of the film was 8×10⁻⁸ cms. Thus a certain phenomenon, of the nature of capillary action, is seen to depend for its existence on the linear dimensions of the film of oil: the physical properties of a film of thickness 10⁻⁶×10⁻⁸ cms. are found to be in some way qualitatively different from those of a film of thickness 8×10⁻⁸ cms. Here is proof that the film of oil is not a continuous homogeneous structure, and we are led to suspect that the scale on which the structure is formed has a unit of length comparable with 8×10⁻⁸ cms. The probability of this conjecture is strengthened when it is discovered that in all phenomena of this type the critical length connected with the stage at which the phenomenon changes its nature is of the order of magnitude of 10⁻⁸ cms.

Lord Rayleigh (Phil. Mag., 1890 [3], 30, p. 474) has pointed out that the earliest known attempt to estimate the size of molecules, made by Thomas Young in 1805, was based upon the consideration of phenomena of the kind just mentioned. Discussing the theory of capillary attractions, Young found that at a rough estimate “the extent of the cohesive force must be limited to about the 250-millionth of an inch” (= about 10⁻⁸ cms.), and then argues that “within similar limits of uncertainty we may obtain something like a conjectural estimate of the mutual distance of the particles of vapours, and even of the actual magnitude of the elementary atoms of liquids…” It appears tolerably safe to conclude that, whatever errors may have affected the determination, the diameter or distance of the particles of water is between two thousand and the ten thousand millionth of an inch” (= between 1-1×10⁻⁸ and 1.05×10⁻⁸ cms.).

The best estimates which we now possess of the sizes of molecules are provided by calculations based upon the kinetic theory of gases. In the following table are given the values of the diameters of the molecules of six substances with which it is easy to experiment in the gaseous state, these values being calculated in different ways from formulæ supplied by the kinetic theory.

The agreement of the values obtained for the same quantity by different methods provides valuable confirmation of the truth of the molecular theory and of the validity of the methods of the kinetic theory of gases. That the results do not agree even

---

1 On the Cohesions of Fluids, Phil. Trans. (1805); Young’s Coll. Works, i. 461.
individual molecules. It is known, however, that when two bodies impinge, the kinetic energy which appears to be lost from the moving bodies is in reality transformed into heat-energy. Thus the molecular theory of matter, as we have now pictured it, leads us to identify heat-energy in a body with the energy of motion of the molecules of the body relatively to one another. A body in which all the molecules were at rest relatively to one another would be a body devoid of heat.

This conception of the nature of heat leads at once to an absolute zero of temperature—a temperature of no heat-motion—which is identical, as will be seen later, with that reached in other ways, namely, about $-273^\circ$ C.

The point of view which has now been gained enables us to interpret most of the thermal properties of solids in terms of molecular theory. Suppose for instance that two bodies, both devoid of heat, are placed in contact with one another, and that the surface of the one is then rubbed over that of the other. The molecules of the two surface-layers will exert forces upon one another, so that, when the rubbing takes place, each layer will set the molecules of the other into motion, and the energy of rubbing will be as in establishing this heat-motion. This we see is the explanation of the phenomenon of the generation of heat by friction. At first the heat-motion will be confined to molecules near the rubbing surfaces of the two bodies, but, as already explained, these will in time set the interior molecules into motion, so that ultimately the heat-motion will become spread throughout the whole mass. Here we have an instance of the conduction of heat.1 When the molecules are oscillating about their equilibrium positions, there is no reason why their mean distance apart should be the same as when they are at rest. This leads to an interpretation of the fact that a change of dimensions usually attends a change in the temperature of a substance. Suppose for instance that two molecules, when at rest in equilibrium, are at a distance $a$ apart. It is very likely that the repulsive force they exert when at a distance $a - \epsilon$ may be greater than the attractive force they exert when at a distance $a + \epsilon$. If so, it is clear that their mean distance, averaged through a sufficiently long interval of their motion, will be greater than $a$. A body made up of molecules of this kind will expand on heating.

As the temperature of a body increases the average energy of the molecules will increase, and therefore the range of their excursions from their positions of equilibrium will increase also. At a certain temperature a stage will be reached in which it is a frequent occurrence for a molecule to wander so far from its position of equilibrium, that it does not return but falls into a new position of equilibrium and oscillates about this. When the body is in this state the relative positions of the molecules are not permanently fixed, so that the body is no longer of unalterable shape: it has assumed a plastic or molten condition. The substance attains to a perfectly liquid state as soon as the energy of motion of the molecules is such that there is a constant rearrangement of position among them.

A molecule escaping from its original position in a body will usually fall into a new position in which it will be held in equilibrium by the forces from a new set of neighbouring molecules. But if the wandering molecule was originally close to the surface of the body, and if it also happens to start off in the right direction, it may escape from the body altogether and describe a free path in space until it is checked by meeting a second wandering molecule or other obstacle. The body is continually losing mass by the loss of individual molecules in this way, and this explains the process of evaporation. Moreover, the molecules which escape are, on the whole, those with the greatest energy. The average energy of the molecules of the liquid is accordingly lowered by evaporation. In this we see the explanation of the fall of temperature which accompanies evaporation.

When a liquid undergoing evaporation is contained in a closed vessel, a molecule which has left the liquid will, after a certain

1 Other processes also help in the conduction of heat, especially in substances which are conductors of electricity.
A state of the system in which these two properties are true will be called a "normal state"; other states will be spoken of as "abnormal." Let all possible states of the system be divided into small ranges of equal extension, and of these let a number $P$ correspond to normal and a number $p$ to abnormal states. What is proved is that, as $s, \epsilon, l$, become very great, the ratio $P/p$ becomes infinite. Considering only systems starting in the $p$ abnormal ranges, it is clear, from the fact that the $p$ ranges do not change with the motion, that after a sufficient time the ranges $p$ will have passed into the $P$ normal ranges. Speaking loosely, we may say that there is a probability $P/(P+p)$, amounting to certainty in the limit, that one of these systems, selected at random, will be in the normal state after a sufficiently long time has elapsed. Again, considering the systems which start from the $P$ normal ranges, we see that there is a probability $P/(P+p)$ which vanishes in the limit, that a system selected at random from these will be in an abnormal state after a sufficiently long time has elapsed. The range, subject to this condition, which is infinitemin the limit, we may state as general laws that—

A system starting from an abnormal state tends to assume the normal state; while

A system starting from the normal state will remain in the normal state.

It will now be found that the various properties of gases follow from the supposition that the gas is in the normal state.

When the fraction of the molecules of the kind, a number $s$ molecules of the first kind, a number $s'v$ molecules of the second kind, have velocities of the components lie between $u$ and $u + du$, then $s'vdu$ is the number of molecules with velocities between $u$ and $u + du$, and $s'vdu$ is the number of molecules of the first kind of which the resultant velocity lies between $c$ and $c + dc$.

The two formulæ express the "law of distribution of velocities" in the normal state: the law is often called Maxwell's Law of Distribution.

The law of equipartition shows that the various mean energies of different kinds are all equal, each being measured by the quantity $1/2kT$. We have already seen an insignificant fraction of the energy becomes proportional to the temperature: it will now be supposed that the mean energy is exactly proportional to the temperature. The complete justification for this supposition will appear later. Partial justification is obtained as soon as it is seen how many physical laws can be explained by it. We accordingly put $1/2kT = K$, where $T$ denotes the temperature on the absolute scale, and then have equations (7) in the form

$$ m^2v^2 = m^2v^2 + = ... = 1/2kT. $$

When a system is composed of a mixture of different kinds of molecules, the fact that $k$ is the same for all constituent fluids, formulæ (5) and (6) shows that in the normal state the different substances are all at the same temperature. For instance, if the system is composed of a gas and a solid boundary, of some terms in the case of a mixture of normal modes to represent the mean energy of the molecules of the boundary, so that equation (7) shows that in the normal state the gas has the same temperature as the boundary.

The process of equalization of temperature is now seen to be a special form of the process of motion towards the normal state: the general laws of the system have been obtained, and the normal state is seen to include as special cases the following laws:—

**Matter originally at non-uniform temperature tends to assume a uniform temperature:**

**Mixture of gases at non-uniform temperature will remain at uniform temperature.**

It will at once be apparent that the kinetic theory of matter enables us to place the second law of thermodynamics upon a purely dynamical basis. So far it has not been necessary to suppose the matter to be in the form of gaseous molecules, but the equalization of laws and properties which are peculiar to the gaseous state.

A simple approximate calculation of the pressure exerted by a gas on its containing vessel can be made by supposing that the molecules are so small in comparison with their distances apart that they may be treated as of infinitesimal size. Let a mixture of gases containing per unit volume $v$ molecules of the first kind, $v'$ of the second kind, and so on. Let us fix our attention on a small area $dS$ of the boundary of the
with an average velocity which, although much smaller than 2 mm.

Thus (11) and (12) express the volume of the atom or molecule, it is equivalent by molecules summing each molecule ordinate per

dS, vessel, and let co-ordinate axes be taken such that the origin is in

dS, and the axis of x is the normal to the origin into the gas. The

number of molecules of the first kind of gas, whose components of

velocity lie within the ranges between u and u + du, v and v + dv, and

w and w + dw will, by formula (5), be

\[ n \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

(9)

per unit volume. Construct a small cylinder inside the gas, having

dS as base and edges such that the projections of each on the co-

ordinate axes are \( u dt, v dt, wd dt \). Each of the molecules enumerated in

expression (9) will move parallel to the edge of this cylinder, and each

will describe a length equal to its edge in time \( dt \). Thus each of these molecules which is initially inside the cylinder, will

impinge on the area dS within an interval \( dt \). The cylinder is of

volume \( u dt dS \), so that the product of this and expression (9) must

give the number of impacts between the area dS and molecules of the

kind considered within the interval \( dt \). Each impinging molecule

exerts an impulsive pressure equal \( \mu x \) on the boundary before the

component of velocity of its centre of gravity normal to the boundary

is reduced to zero. Thus the contribution to the total impulsive pressure

exerted on the area dS in time \( dt \) from this cause is

\[ \mu x du dt \int \int \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

(10)

The total pressure exerted in bringing the centres of gravity of all

the colliding molecules to rest normally to the boundary is obtained

by first integrating this expression with respect to \( u, v, w \), the limits being all values for which collisions are possible (namely

from \(-w \rightarrow 0 \) for \( u \), and from \(-w \rightarrow 0 \) for \( v \) and \( w \)), and

then summing for all atoms in the gas. Further impulsive pressures are

required to restart motion all the molecules which have undergone
collision. The aggregate amount of these pressures is clearly the

sum of the momenta, normal to the boundary, of all molecules which

have had an impact with the surface within a time \( dt \). If in formula

(10) is integrated with respect to \( u \) from \( 0 \rightarrow \infty \), and with respect to \( v \) and \( w \) from \(-w \rightarrow 0 \), and then summed for all kinds of molecules in the gas. On combining the two parts of the pressure which have been calculated, the aggregate impulsive pressure on dS in time \( dt \) is found to be

\[ \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

\[ \Sigma v_{i} dS (v)^{2} \]

\[ \mu x dS \]

\[ \int \int \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

\[ \mu x dS \]

\[ \Sigma v_{i} dS (v)^{2} \]

\[ \mu x dS \]

\[ \int \int \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

\[ \mu x dS \]

\[ \int \int \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

\[ \mu x dS \]

\[ \int \int \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

\[ \mu x dS \]

\[ \int \int \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

\[ \mu x dS \]

\[ \int \int \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]

\[ \mu x dS \]

\[ \int \int \int f \left( \frac{4}{3} \pi a^3 n \right) \frac{1}{w} dw \left( \frac{4}{3} \pi b^3 n \right) \frac{1}{v} dv \left( \frac{4}{3} \pi c^3 n \right) \frac{1}{u} du. \]
throughout the motion, \( T/p \) is constant and \( dQ = Jc_{p}N_{m}dT \), whence
\[
C_{p} = \frac{1}{(n+4)}R\frac{1}{T}. \quad (20)
\]

By division of the values of \( C_{p} \) and \( C_{v} \), we find for \( \gamma \), the ratio of the specific heats,
\[
\gamma = 1 + 2/(n+3). \quad (21)
\]

The comparison of this formula with experiment provides a striking confirmation of the truth of the kinetic theory but we meet with the most formidable difficulty which the theory has so far had to encounter.

On giving different values to \( n \) in formula (21), we obtain the values for \( \gamma \):

- for \( n = 0 \),
  \( \gamma = 1 \)
- for \( n = 1 \),
  \( \gamma = 1 + \frac{2}{5} \approx 1.4 \)
- for \( n = 2 \),
  \( \gamma = 1 + \frac{2}{3} = 1.66 \)
- for \( n = 3 \),
  \( \gamma = 1 + \frac{2}{4} = 1.5 \)
- for \( n = 4 \),
  \( \gamma = 1 + \frac{2}{5} = 1.4 \)

Thus, to within the degree of approximation to which our theory is accurate, the value of \( \gamma \) for every gas ought to be one of this series. The following are the values of \( \gamma \) for gases for which \( \gamma \) can be observed with some accuracy:

- Mercury, \( \gamma = 1.66 \)
- Nitrogen, \( \gamma = 1.40 \)
- Krypton, \( \gamma = 1.66 \)
- Carbon monoxide, \( \gamma = 1.41 \)
- Hydrogen, \( \gamma = 1.40 \)
- Oxygen, \( \gamma = 1.40 \)
- Air, \( \gamma = 1.40 \)
- Hydrochloric acid, \( \gamma = 1.39 \)

It is clear that for the first four gases \( n = 0 \), while for the remainder \( n = 2 \). To examine what is meant by a zero value of \( n \) we refer to formula (15). The value of \( n \) is the number of terms in the energy of the molecule, or, in general, the number of atoms or radicals in a molecule. Thus, when \( n = 0 \), the whole energy must be translational: there can be no energy of rotation or of internal motion. The molecules of gases for which \( n = 0 \) must accordingly be spherical in shape and in internal structure, or in short must be atactic in form and incapable of motion, for they would otherwise be set into rotation by the forces experienced at collisions. In the light of these results it is of extreme significance that the four gases for which \( n = 0 \) are all believed to be monatomic: \( n \) of the specific heat of the elements in the solid state. Moreover, these four are the only monatomic gases for which the value of \( \gamma \) is known, so that the only atoms of which the shape can be determined are found to be spherical. It is at least a plausible conjecture, until the contrary is proved, that the atoms of all elements or radical groups are spherical.

The next value which occurs is \( n = 2 \). The kinetic energy of the molecules of these gases must contain two terms in addition to those representing translational energy. For a rigid body the kinetic energy will, in general, consist of three terms \((T + \omega^{2} + \omega' \omega' + \omega'' \omega'')\) in addition to the translational energy. The value \( n = 2 \) is appropriate to bodies of which the shape is that of a solid of revolution, so that there is no rotation about the axis of symmetry. We must accordingly suppose that the molecules of gases for which \( n = 2 \) are of this shape. Now this is exactly the shape which we should expect to find in molecules composed of two spherical atoms disturbing one another by their mutual forces, and all gases for which \( n = 2 \) are diatomic.

No molecule could possibly be imagined for which \( n \) had a negative value or the value \( n = 1 \). The theory therefore passes a crucial test when it is discovered that no gases exist for which \( n \) is either negative or equal to one, and it is only through the very serious difficulty in the fact that all molecules possess a great number of possibilities of internal motion, as is shown by the number of distinct lines in their spectra both of emission and of absorption. So far as is known, every one of the lines in the spectrum of, say, mercury, represents a possible of distinct vibration of the mercury atom, and accordingly provides two terms (say \( a \theta^{2} + b \phi^{2} \), where \( \phi \) is the normal co-ordinate of the vibration) in the expression for the energy of the molecule. There are many thousands of lines in the mercury spectrum, and so it is highly probable that for mercury vapour \( n \) ought to be very great, and \( \gamma \) almost equal to unity. Instead of this we have \( n = 0 \) and \( \gamma = 1 \).

As a step towards removing this difficulty we notice that the energy of a vibration such as that represented by the spectral line has a peculiarity of being unable to exist (so far as we know) without suffering dissipation into the ether. This energy, therefore, comes under a different category from the energy for which the law of equipartition was proved, for in proving this law conservation of energy was assumed. The difficulty is further diminished when it is proved, as it can be proved,2 that the modes of energy represented in the atomic spectrum acquire energy so slowly that the atom might undergo collisions with other atoms for centuries before it gains any appreciable amount of energy. In fact the present tendency for the gas to pass into the "normal state" in which there is equipartition of energy, represents in this case nothing but the tendency for the translational energy to become dissipated into the energy of innumerable small vibrations. We find that this dissipation, although undoubtedly going on, proceeds with extreme slowness, so that the vibrations pass their energy on to the ether as rapidly as they acquire it, and the "normal state" is never established. These facts suggest that the difficulty which has been pointed out may be apparent rather than real. At the same time this difficulty is only one aspect of a wider difficulty which cannot be lightly passed over. Maxwell himself regarded it as the principal obstacle in the way of the full acceptance of the theory of which he was largely the author.

MOLESWORTH, SIR W.—MOLIÈRE

England (1882); and SIR Guilford MOLESWORTH (b. 1828), an eminent engineer and economist.

MOLESWORTH, SIR WILLIAM, Bart. (1810-1855), English politician, son of the 7th baronet, was born in London on the 23rd of May 1810, and in 1825 succeeded to the baronetcy. At Cambridge he fought a duel with his tutor, and for some time studied abroad. On the passing of the Reform Act of 1832 he was returned to parliament for the eastern division of Cornwall, to support the ministry of Lord Grey. Through Charles Buller he made the acquaintance of Grote and James Mill, and in April 1835 he founded, in conjunction with Roeback, the London Review, as an organ of the "Philosophical Radicals." After the publication of two volumes he purchased the Westminster Review, and for some time the united magazines were edited by him and J. S. Mill. From 1837 to 1841 Sir William Molesworth sat for Leeds, and acquired considerable influence in the House of Commons by his speeches and by his tact in presiding over the select committee on transportation. But his Radicalism made little impression either on the house or on his constituency. From 1841 to 1845 he had no seat in parliament, occupying his leisure time in editing the works in Latin and English of Thomas Hobbes of Malmesbury, a recreation which cost him no less than 70000l. In 1845 he was returned for Southwark, and retained that seat until his death. On his return parliament he devoted special attention to the condition of the colonies, and was the ardent champion of their self-government. In January 1853 Lord Aberdeen included him in the cabinet as first commissioner of works, the chief work by which his name was brought into prominence at this time being the construction of the new Westminster Bridge; he also was the first to open Kew Gardens on Sundays. In July 1855 he was made colonial secretary, but he died on the 22nd of October.

MOLESWORTH was for many years a great friend of Mr and Mrs Grote, and Mrs Grote's privately printed work on The Philosophical Radicals (1866) contains an account of his life. He married in 1844, but had no children, and the baronetcy passed to a cousin. His sister (d. 1910) married Richard Ford, famous for his Handbook of Spain.

A Life by Mrs Fawcett was published in 1903. A full pedigree of the Molesworth family is printed in Sir John Maclean's Trigg Minor, vol. i.; the titles of his speeches and works may be found in the Bibl. Cornubiensis, vol. i. and iii.

MOLFETTA, a seaport and episcopal see of Apulia, Italy, in the province of Bari, from which it is 16 m. N.W. by rail. Pop. (1901), 42,363. The old cathedral of S. Conrad is a Romanesque structure. The old town is surrounded by walls, and has medieval houses; the new town is more spacious, and is an active seaport. The origin of Molfetta is uncertain, though there was a neolithic settlement here. The town was given by Charles V. to the dukes of Tornoli in 1522, and during his lordship it was sacked by the French under Lautrec. In 1631 Cesare Gonzaga took the title of duke of Guastalia and prince of Molfetta; but in 1640 the fief was sold to the Spinola family, and in 1798 incorporated with the royal domain. The bishopric is directly subject to the papal see.

MOLIÈRE (1622-1673), the nom de théâtre chosen, for some undiscovered reason, by the great French dramatist Jean Baptiste Poquelin, and ever since substituted for his family name. He was born in Paris, in January 29th, 1622. The baptismal certificate which is usually, and almost with absolute certainty, accepted as his is dated 15th January 1622, but it is not possible to infer that he was born on the day of his christening. The exact place of his birth is also disputed, but it seems tolerably certain that he saw the light in a house of the Rue St Honoré. His father was Jean Poquelin, an upholsterer, who, in 1632, succeeded his own uncle as "valet tapissier de chambre du roi." The family of Poquelin came from Beauvais, where for some centuries they had been prosperous tradesmen. The legend of their Scotch descent seems to have been finally disproved by the researches of M. E. Révéré du Mesnil. The mother of Molière was Marie Cressé; and on his father's side he was connected with the family of Mazuel, musicians attached to the court of France. In 1632 Molière lost his mother; his father married again in 1633. The father possessed certain shops in the covered Halle de la Foire, Saint Germain des Prés, and the biographers have imagined that Molière might have received his first bent towards the stage from the spectacles offered to the holiday people at the fair. Of his early education little is known; but it is certain that his mother possessed a Bible and Plutarch's Lives, books which an intelligent child would not fail to notice. In spite of a persistent tradition, there is no reason to believe that the later education of Molière was neglected. "Il fit ses humanitez au collège de Clermont," says the brief life of the comic published by his friend and fellow-actor, La Grange, in the edition of his works printed in 1682. La Grange adds that Molière "eut l'avantage de suivre M. le Prince de Conti dans toutes ses classes." As Conti was seven years younger than Molière, it is not easy to understand how Molière came to be the school contemporary of the prince. Among more serious studies the Jesuit fathers encouraged their pupils to take part in ballets, and in later life Molière was a distinguished master of this sort of entertainment. According to Grimarest, the first writer who published a life of Molière in any detail (1705), he not only acquired "his humanities," but finished his "philosophy" in five years. He left the Collège de Clermont in 1641, the year when Gassendi, a great contemnor of Aristotle, arrived in Paris. Molière's father and Elizabeth, and Molière's tutor, were the chief philosophical textbooks at the Collège de Clermont. But when he became the pupil of Gassendi (in company with Cyrano de Bergerac, Chapelle, and Hesnaut), Molière was taught to appreciate the atomic philosophy of Lucretius. There seems no doubt that Molière began, and almost or quite finished, a translation of the De natura rerum. According to a manuscript note of Trallage, published by M. Paul Lacroix, the manuscript was sold by Molière's widow to a bookseller. His philosophical studies left a deep mark on the genius of Molière. In the Jugement de Pluton sur les deux parties des nouveaux dialogues des mors (1684), the verdict is "que Molière ne parleroit point de philosophie." To "talk philosophy" was a favourite exercise of his during his life, and his ideas are indicated with sufficient clearness in several of his plays. There seems no connexion between them and the opinions of Molière le Critique in a dialogue of that name, published in 1665. From 1700 to 1710, the study of philosophy, too, he gained his knowledge of the ways of contemporary politicians: of Fénéron the Aristotelian, of Marborrhous the Cartesian, of Trissotin, "qui s'attache pour l'ordre au Péripatétisme," of Philaminte, who loves Platonism, of Belise, who relishes "les petits corps," and Armande, who loves "les tourbillons." Grimarest has an amusing anecdote of a controversy in which Molière, defending Descartes, chose a lay-brother of a begging order for umpire, while Chapelle appealed to the same expert in favour of Gassendi. His college education over, Molière studied law, and there is even evidence—that of tradition in Grimarest, and of Le Boulangier de Chalassay, the libellous author of a play called Élémire hypocôndre—to prove that he was actually called to the bar. More trustworthy is the passing remark in La Grange's short biography (1682), "au sortir des écoles de droit, il choisit la profession de comédien." Before joining a troop of half-amateur comedians, however, Molière had some experience. His father's brother, in 1637 his father had obtained for him the right to succeed to his own office as "valet tapissier de chambre du roi." The document is mentioned in the inventory of Molière's effects, taken after his death. When the king travelled the valet tapissier accompanied him to arrange the furniture of the royal quarters. There is very good reason to believe (Loiseleur, Points obscrus, p. 94) that Molière accompanied Louis XIII. as his valet tapissier to Provence in 1642. It is even not impossible that Molière was the young valet de chambre who concealed Cinq Mars just before his arrest at Narbonne, on the 13th of June 1642. But this is part of the romance rather than of the history of Molière. Our next glimpse of the comedian we get in a document of 6th January 1643. Molière acknowledges the receipt of money
due to him from his deceased mother's estate, and gives up his claim to succeed his father as "valet de chambre du roi." On the 28th of December of the same year we learn, again from documentary evidence, that Jean Baptiste Poquelin, with Joseph Béjard, Madeleine Béjard, Geneviève Béjard, and others, have hired a tennis-court and fitted it up as a stage for dramatic performances. The company called themselves L'Illustre, illustré being then almost a slang word, freely employed by the writers of the period.

We now reach a very important point in the private history of Molière, which it is necessary to discuss at some length in defence of the much maligned character of a great writer and a good man. Molière's connexion with the family of Béjard brought him much unhappiness. The father of this family, Joseph Béjard the elder, was a needy man, with eleven children at least. His wife's name was Marie Hervé. The most noted of his children, companions of Molière, were Joseph, Madeleine, Geneviève, and Armande. Of these, Madeleine was a woman of great talent as an actress, and Molière's friend, or perhaps mistress, through all the years of his wanderings. Now, on the 14th of February 1662 (for we must here leave the chronological order of events), Molière married Armande Claire Élisabeth Gréslinde Béjard. His enemies at that time, and a number of his biographers in our own day, have attempted to prove that Armande Béjard was not the sister, but the daughter of Madeleine, and even that Molière's wife may have been his own daughter by Madeleine Béjard. The arguments of M. Arsène Houssaye, in support of this abominable theory are based on reckless and ignorant confusions, and do not deserve criticism. But the system of M. Loiseleur is more serious, and he goes no further than the idea that Madeleine was the mother of Armande. This, certainly, was the opinion of tradition, an opinion based on the slanders of Montfleury, a rival of Molière's, on the authority of the spiteful and anonymous author of La Fausse comédienne (1688), and on the less libellous play, Élomière hypocondre. In 1821 tradition received a shock, for Bellefard then discovered Molière's "acte de mariage," in which Armande, the bride, is spoken of as the sister of Madeleine Béjard, by the same father and mother. The old scandal, or part of it, was revived by M. Fournier and M. Bazin, but received another blow in 1863. M. Soulé subsequently discovered a legal document of the 10th of March 1643, in which the widow of Joseph Béjard renounced, in the name of herself and her children, his inheritance, chiefly a collection of unpaid bills. Now in this document all the children are described as minors, and among them is "une petite non encore baptisée." This little girl, still not christened in March 1643, is universally recognized as the Armande Béjard afterwards married by Molière. We reach this point, then, that when Armande was an infant she was acknowledged as the sister, not as the daughter, of Madeleine Béjard. M. Loiseleur refuses, however, to accept this evidence. Madeleine, says he, had already become the mother, in 1638, of a daughter by Esprit Raymond de Moirmon, comte de Modène, and chamberlain of Gaston duc d'Orléans, brother of Louis XIII. In 1642 Modène, who had been exiled for political reasons, "was certain to return, for Richelieu had just died, and Louis XIII was likely to follow him." Now Madeleine was again—this is M. Loiseleur's hypothesis—about to become a mother, and if Modène returned, and learned this fact, he would not continue the liaison, still less would he marry her—which, by the way, he could not do, as his wife was still alive. Madeleine, therefore, instructed her mother to acknowledge the little girl as her own child. In the first place, all this is pure unsupported hypothesis. In the second place, it has always been denied that Béjard's wife could have been a mother in 1643, owing to her advanced age, probably fifty-three. But M. Loiseleur himself says that Marie Hervé was young enough to make the story "sufficiently probable." If it was probable, much more was it possible. M. Loiseleur supports his contention by pointing out that two of the other children, described as legally minors, were over twenty-five, and that their age was understated to make the account of Armande's birth more probable. Nothing is less likely than that Molière would have consulted this document to ascertain the truth about the parentage of Armande, yet M. Loiseleur's whole theory rests on that extreme improbability. It must also be observed that the date of the birth of Joseph Béjard is unknown, and he may have been, and according to M. Jall (Dictionnaire de la Comédie, 1788) it must have been, a minor when he was so described in the document of the 10th of March 1643, while Madeleine had only passed her twenty-fifth birthday, her legal majority, by two months. This view of Joseph's age is supported by Bouquet (Molière à Rouen, p. 77). M. Loiseleur's only other proof is that Marie Hervé gave Armande a respectable dowry, and that, as we do not know whence the money came, it must have come from Madeleine. The tradition in Grimaire, which makes Madeleine behave en femme furieuse, when she heard of the marriage, is based on a juster appreciation of the character of women. It will be admitted, probably, that the reasons for supposing that Molière espoused the daughter of a woman who had been his mistress (if she had been his mistress) are flimsy and inadequate. The affair of the dowry is insisted on by M. Livet (La Fausse comédienne, reprint of 1877, p. 143). But M. Livet explains the dowry by the hypothesis that Armande was the daughter of Madeleine and the comte de Modène, which exactly contradicts the theory of M. Loiseleur, and is itself contradicted by dates, at least as understood by M. Loiseleur. Such are the conjectures by which the foul calumnies of Molière's enemies are supported in the essays of M. Erouch and M. Meichtelet.

Michelet accepted the scandal apparently as a buttress to his charges against Louis XIV. and Madame (Histoire de France, 1879, xv. 63, 64, 332).

To return to the order of events, Molière passed the year 1643 in playing with and helping to manage the Théâtre Illustre. The company acted in various tennis-courts, with very little success. Molière was actually arrested by the traderman who supplied candles, and the company had to borrow money from one Aubrey to release their leader from the Grand Châtelet (Aug. 13, 1645). The process of turning a tennis-court into a theatre was somewhat expensive, even though no seats were provided in the pit. The troupe was for a short time under the protection of the duc d'Orléans, but his favours were not lucrative. The duc de Guise, according to some verses printed in 1646, made Molière a present of his cast-off wardrobe. But costume was not enough to draw the public to the tennis-court theatre of the Croix Noire, and empty houses at last obliged the Théâtre Illustre to leave Paris at the end of 1646.

"Nul animal vivant n'entra dans notre salle," says the author of the scurrilous play on Molière, Élomière hypocondre. But at that time some dozen travelling companies found means to exist in the provinces, and Molière determined to play among the rural towns. The career of a strolling player is much the same at all times and in all countries. The Roman comique of Scarron gives a vivid picture of the adventures and misadventures, the difficulty of transport, the queer cavalcade of horses, mules, and lumbering carts that drag the wardrobe and properties, the sudden metamorphosis of the tennis-court, where the balls have just been rattling, into a stage, the quarrels with local squires, the disturbed nights in crowded country inns, all the loves and wars of a troupe on the march. Perrault tells us what the arrangements to the theatre were in Molière's early time. Tapestries were hung round the stage, and entrances and exits were made by struggling through the heavy curtains, which often knocked off the hat of the comedian, or gave a strange cock to the helmet of a warrior or a god. The lights were candles stuck in tin sconces at the back and sides, but luxury sometimes went so far that a chandelier of four candles was suspended from the roof. At intervals the candles were let down by a rope and pulley, and any one within easy reach snuffed them with his fingers. A flute and tambour, or two fiddlers, supplied the music. The highest prices were paid for seats in the dedans (cost of admission fivepence); for the privilege of standing up
in the pit twopence-halfpenny was the charge. The doors were opened at one o'clock, the curtain rose at two.

The nominal director of the Théâtre Illustre in the provinces was Du Fresne; the most noted actors were Molière, the Béjards, and Du Parc, called Gros René. It is extremely difficult to follow exactly the line of march of the company. They played at Bordeaux, for example, but the date of this performance, when Molière (according to Montesquieu) failed in tragedy and was pelted, is variously given as 1644–1645 (Trallage), 1647 (Loiselher), 1648–1658 (Lacroix). Perhaps the theatre prospered better elsewhere than in Paris, where the streets were barricaded in these early days of the war of the Fronde. We find Molière at Nantes in 1648, at Fontenay-la-Compte, and in the spring of 1649 at Agen, Toulouse, and probably at Angoulême and Limoges. In January 1650 they played at Narbonne, and between 1650 and 1653 Lyons was the headquarters of the troupe. In January 1653, or perhaps 1655, Molière gave L'Étourdi at Lyons, the first of his finished plays, as contrasted with the slight farces with which he generally diverted a country audience. It would be interesting to have the precise date of this piece, but La Grange (1682) says that "in 1653 Molière went to Lyons, where he gave his first comedy, L'Étourdi," while in his Registre La Grange enters the year as 1655. At Lyons de Brie and his wife, the famous Mlle de Brie, entered the troupe, and the Paris married the "marquise" de Gorla, better known as Mlle du Parc. The libellous author of La Fausse comédienne reports that Molière's heart was the shuttercock of the beautiful de Parc and de Brie, and the tradition has a persistent life. Molière's own opinion of the ladies and men of his company may be read between the lines of his Improptu de Versailles. In 1653 Prince de Conti, after many political adventures, was residing at La Grange, near Pézenas, in Languedoc, and chance brought him into relations with his old schoolfellow Molière. Conti had for first gentleman of his bed-chamber the abbé Daniel de Cosnac, whose memoirs now throw light for a moment on the fortunes of the wandering troupe. Cosnac engaged the company "of Molière and of La Béjart"; but another company, that of Cormier, nearly intercepted the favour of the prince. Thanks to the resolution of Cosnac, Molière was given one chance of appearing on the private theatre of La Grange. The excellence of his acting, the splendour of the costumes, and the insistence of Cosnac, and of Sarrasin, Conti's secretary, gained the day for Molière, and a pension was assigned to his company (Cosnac, Mémoires, i. 128; Paris, 1852). As Cosnac proposed to pay Molière a thousand crowns of his own money to recompense him in case he was supplanted by Cormier, it is evident that the bishop's province was considered lucrative. In 1654, during the session of the estates of Languedoc, Molière and his company played at Montpellier. Here Molière danced in a ballet (Le Ballet des incompatibles) in which a number of men of rank took part, according to the fashion of the time. Molière's own rôles were those of the Poet and the Fishwife. The spirit of the little piece is to introduce opposite characters, dancing and singing together. Silence dances with six women, Truth with four courtiers, Money with a poet, and so forth. Whether the ballet, or any parts of it, are by Molière, is still disputed (La Jeunesse de Molière, suivie du ballet des incompatibles, P. L. Jacob, Paris, 1858). In April 1655 it is certain that the troupe was at Lyons, where they met and hospitably entertained a profligate buffoon, Charles d'Assoucy, who informs the ages that Molière kept open house, and "une table bien garnie." November 1655 found Molière at Pézenas, where the estates of Languedoc were convened, and where local tradition points out the barber's chair in which the poet used to sit and study character. The longest of Molière's extant autographs is a receipt, dated at Pézenas, on the 4th of February 1656, for 6000 livres, granted by the estates of Languedoc. This year was notable for the earliest representation, at Béziers, of Molière's second finished comedy, the Dépit amoureux. Conti now (1656) began to "make his soul." Almost his first act of tenacity was to discard Molière's troupe (1657), which consequently found that the liberality of the estates of Languedoc was dried up for ever. Conti's relations with Molière must have definitely closed long before 1666, when the now pious prince wrote a treatise against the stage, and especially charged his old school-fellow with keeping a new school, a school of atheism (Traité de la comédie, p. 24; Paris, 1666). Molière was now (1657) independent of princes and their favour. He went on a new circuit to Nîmes, Orange and Avignon, where he met another old class-mate, Chapelie, and also encountered the friend of his later life, the painter Magnard. After a later stay at Lyons, ending with a piece given for the benefit of the poor on the 27th of February 1658, Molière passed to Grenoble, returned to Lyons, and is next found in Rouen, where, we should have said, the Théâtre Illustre had played in 1643 (F. Bouquet, La Troupe de Molière à Rouen, p. 90; Paris, 1880). At Rouen Molière must have made or renewed the acquaintance of Pierre and Thomas Corneille. His company had played pieces by Corneille at Lyons and elsewhere. The real business of the comedian in Rouen was to prepare his return to Paris. "After several secret journeys thither he was fortunate enough to secure the patronage of Monsieur, the king's only brother, who granted him his protection, and permitted the company to take his name, presenting them as his servants to the king and the queen mother" (Preface to La Grange's edition of 1682). The troupe appeared for the first time before Louis XIV. in a theatre arranged in the old Louvre (Oct. 24, 1658).

Molière was now thirty-six years of age. He had gained all the experience that fifteen years of practice could give. He had seen men and cities, and noted all the humours of rural and civic France. He was at the head of a company which, as La Grange, his friend and comrade, says, "sincerely loved him." He had the un lucrative patronage of a great prince to back him, and the jealousy of all playwrights, and of the old theatres of the Hôtel de Bourgogne and the Marais, to contend against. In this struggle we can follow him by aid of the Registre de La Grange (a brief diary of receipts and payments), and by the help of notices in the rhymed chronicles of Loret.

The first appearance of Molière before the king was all but a failure. N icomède, by the elder Corneille, was the piece, and we may believe that the actors of the Hôtel de Bourgogne, who were present, found much to criticize. When the play was over, Molière came forward and asked the king's permission to act "one of the little pieces with which he had been used to regale the provinces." The Docteur amoureux, one of several slight comedies admitting of much "gag," was then performed, and "diverted as much as it surprised the audience." The king demanded that the troupe should establish itself in Paris (Preface, ed. 1682). The theatre assigned to the company was a salle in the Petit Bourbon, in a line with the present Rue du Louvre. Some Italian players already occupied the house on Tuesdays, Fridays, and Sundays; the company of Molière played on the other days. The first piece played in the new house (Nov. 3, 1658) was L'Étourdi. La Grange says the comedy had a great success, producing seventy pistols for each actor. The success is admitted even by the spiteful author of Eblouir hypochondre (Paris, 1670):—

"Je jouai L'Étourdi, qui fut une merveille." The success, however, is attributed to the farcical element in the play and the acting—the cuckoo-cry of Molière's detractors. The original of L'Étourdi is the Italian comedy (1639) L'inver- terti, by Nicolò Barbieri detto Beltrame; Molière pushed rather far his right to "take his own wherever he found it." Had he written nothing more original, the contemporary critic of the Festin de Pierre might have said, not untruly, that he only excelled in stealing pieces from the Italians. The piece is conventional: the stock characters of the prodigal son, the impudent valet, the old father occupy the stage. But the dialogue has amazing rapidity, and the vivacity of M. Coquelin to Mascarelle made L'Étourdi a favourite on the modern stage, though it cannot be read with very much pleasure. The next piece, new in Paris, though not in the provinces, was the Dépit amoureux (first acted at Béziers, 1656). The play was not
less successful than L'Étourdi. It has two parts, one an Italian imbroglio; the other, which alone keeps the stage, is the original work of Molière, though, of course, the idea of amantium irae is as old as literature. "Nothing so good," says Mr Staintsbury, "had yet been seen on the French stage, as the quarrels and reconciliations of the quartette of master, mistress, valet and soubrette." Even the hostile Le Boulanger de Chalussy (Éloïre hypochondre) admits that the audience was much of this opinion:

"C'est la faire et jouer les pièces comme il faut."

The same praise was given, perhaps even more deservedly, to Les Précieuses ridicules (Nov. 18, 1659). Doubts have been raised as to whether this famous piece, the first true comic satire of contemporary foibles on the French stage, was a new play. La Grange calls it pièce nouvelle in his Registre; but, as he enters it as the third pièce nouvelle, he may only mean that, like L'Étourdi, it was new to Paris. The short life of 1682, produced under La Grange's care, and probably written by Marcel the actor, says the Précieuses was "made" in 1659. There is another controversy as to whether the ladies of the Hôtel Rambouillet, or merely their bourgeoises and rustic imitators, were laughed at. Ménage, in later years at least, professed to recognize an attack on the over-refinement and affectation of the original and, in most ways, honourable précieuses of the Hôtel Rambouillet. But Chapelle and Bachaumont had discovered provincial précieuses, hyper-aesthetic literary ladies, at Montpellier before Molière's return to Paris, and Furetière, in the Roman bourgeois (1666), found Paris full of middle-class précieuses, who had survived, or, like their modern counterparts, had thriven on ridicule.

Another question is: Did Molière copy from the earlier Précieuses of the abbé de Pure? This charge of plagiarism is brought by Somaize, in the preface to his Véritables précieuses. De Pure's work was a novel (1656), from which the Italian actors had put together an acting-piece in their manner—that is, a thing of "gag," and improvised speeches. The reproach is interesting only because it proves how early Molière found enemies who, like Thomas Corneille in 1659, accused him of being skilled only in farce, or, like Somaize, charged him with literary larceny. These were the stock criticisms of Molière's opponents as long as he lived. The success of the Précieuses ridicules was immense; on one famous occasion the king was a spectator, leaning against the great chair of the dying Cardinal Mazarin. The play can never cease to please while literary affectation exists, and it has a comic force of deathless energy. Yet a modern reader may spare some sympathy for the poor heroines, who do not wish, in courtship, to "begin with marriage," but prefer first to have some less formidable acquaintance with their wooers. Molière's next piece was less important, and more purely farcical, Sganarelle; ou le cœu imaginaire (May 28, 1660). The public taste preferred a work of this light nature, and Sganarelle was played every year as long as Molière lived. The play was pirated by a man who pretended to have retained all the words in his memory. The counterfeit copy was published by Ribou, a double injury to Molière, as, once printed, any company might act the play. With his habitual good-nature, Molière not only allowed Ribou to publish later works of his, but actually lent money to that knave (Soulé, Recherches, p. 287).

On the 11th of October 1660 the Théâtre du Petit Bourbon was demolished by the superintendent of works, without notice given to the company. The king gave Molière the Salle du Palais Royal, but the machinery of the old theatre was maliciously destroyed. Meanwhile the older companies of the Marais and the Hôtel de Bourgogne attempted to lure away Molière's troupe, but, as La Grange declares (Registre, p. 26), "all the actors loved their chief, who united to extraordinary genius an honourable character and charming manner, which compelled them all to protest that they would never leave him, but always share his fortunes." While the new theatre was being put in order, the company played in the houses of the great, and before the king at the Louvre. In their new house (originally built by Richelieu) Molière began to play on the 20th of January 1661. Molière now gratified his rivals by a failure. Don Garcie de Navarre, a heavy tragi-comedy, which had long lain among his papers, was first represented on the 4th of February 1661. Either Molière was a poor actor outside comedy, or his manner was not sufficiently "stagy," and, as he says, "demoniac," for the taste of the day. His opponents were determined that he could not act in trag-comedy, and he, in turn, besmirched their pretentious and exaggerated manner in a later piece. In the Précieuses (ix.) Molière had already rallied "les grands comédiens" of the Hôtel Bourgogne. "Les autres," he makes Mascarelle say about his own troupe, "sont des ignorants qui réclament comme l'on parle, ils ne savent pas faire roULER les vers." All this was likely to irritate the grands comédiens, and their friends, who avenged themselves on that unfortunate jealous prince, Don Garcie de Navarre. The subject of this unsuccessful drama is one of many examples which show how Molière's mind was engaged with the serious or comic aspects of jealousy, a passion which he had soon cause to know most intimately. Meantime the everyday life of the stage went on, and the doorkeeper of the Théâtre St Germain was wounded by some revellers who tried to force their way into the house (La Grange, Registre). A year later, an Italian actor was stabbed in front of Molière's house, where he had sought to take shelter (Campardon, Nouvelles pièces, p. 26). To these dangers actors were peculiarly subject: Molière himself was frequently threatened by the marqueses and others whose class he ridiculed on the stage, and there seems even reason to believe that there is some truth in the story of the angry marquis who rubbed the poet's head against his buttons, thereby cutting his face severely. The story comes late (1725) into his biography, but is supported by a passage in the contemporary play, Zéline (Paris, 1663, scene viii.). Before Easter, Molière asked for two shares in the profits of his company, one for himself, and one for his wife, if he married. That fatal step was already contemplated (La Grange). On the 24th of June he brought out for the first time L'École des maris. The general idea of the piece is as old as Menander, and Molière was promptly accused of pilfering from the Adelphi of Terence. One of the fetes of the comedy is borrowed from a story as old, at least, as Boccaccio, and still amusing in a novel by Charles de Bernard. It is significant of Molière's talent that the grotesque and baffled paternal wooer, Sganarelle, like several other butts in Molière's comedy, does to certain extent win our sympathy and pity as well as our laughter. The next new piece was Les Fachesux, a comédie-ballet, the Comedy of Boreys, played before the king at Fouquet's house at Vaux le Vicomte (Aug. 15–20, 1661). The comedians, without knowing it, were perhaps the real "fachesux" on this occasion, for Fouquet was absorbed in the schemes of his insatiable ambition (Quo non ascendam? says his motto), and the king was organizing the arrest and fall of Fouquet, his rival in the affections of La Vallière. The author of the prologue to Les Fachesux, Pellisson, a friend of Fouquet's, was arrested with the superintendent of finance. Pellisson's prologue and name were retained in the later editions. In the dedication to the king Molière says that Louis suggested one scene (that of the Sportsman), and in another place he mentions that the piece was written, rehearsed, and played in a fortnight. The fundamental idea of the play, the interruptions by bores, is suggested by a satire of Régnier's, and that by a satire of Horace. Perhaps it may have been the acknowledged suggestions; The king and his gossips declare that Molière habitually worked up hints and memories given him by persons of quality (Nouvelles nouvelles, 1663).

In February 1662 Molière married Armandé Béjard. The date is given thus in the Registre of La Grange: "Mardi 14, Les Visionnaires, L'École des M.

"Part. Visite chez M. de Equequilly.

And on the margin he has painted a blue circle—his way of recording a happy event—with the words, "marriage de M. de Molière au sortir de la Visite." M. Loiselle gives the date in one passage as the 29th of February; in another as the 29th of..."
February. But La Grange elsewhere mentions the date as "Shrove Tuesday," which was, it seems, the 14th of February. Elsewhere M. Loiseleur makes the date of the marriage a vague day "in January." The truth is that the marriage contract is dated the 23rd of January 1662 (Soulie, Documents, p. 202). Where it is so difficult to establish the date of the marriage, a simple fact, it must be infinitely harder to discover the truth as to the conduct of Mme Molière. The abominable assertions of the"Les Intrigues de Molière et celles de sa femme, ou la fameuse comédienne"(1688), have found their way into tradition, and are accepted by many biographers. But M. Livet and M. Bazin have proved that the alleged lovers of Mme Molière were actually absent from France, or from the court, at the time when they are reported, in the libel, to have conquered her heart. A conversation between Chapelle and Molière, in which the comedian is made to tell the story of his wrongs, is plainly a mere fiction, and is answered in Grimaest by another dialogue between Molière and Rohault, in which Molière only complains of a jealousy which he knows to be unfounded. It is noticed, too, that the contemporary assailants of Molière counted him among jealous, but not among deceived, husbands. The hideous accusation brought by the actor Montfleury, that Molière had married his own daughter, Louis XIV, answered by becoming the godfather of Molière's child. The king, indeed, was a firm friend of the actor, and, when Molière was accused of impertinence on the production of Don Juan (1665), Louis gave him a pension. We need not try to make Mme Molière a vertu, as French ladies of the theatre say, but it is certain that the charges against her are unsubstantiated. It is generally thought that Molière drew her portrait in Le Bourgeois gentilhomme (acte iii. sc. ix.), "elle est capricieuse, mais on souffre tout des belles."

From 1662 onwards Molière suffered the increasing hatred of his rival actors. La Grange mentions the visit of Floridor and Montfleury to the queen mother, and their attempt to obtain equal favour, "la troupe de Molière leur donnait beaucoup de jalouse" (Aug. 12, 1662). On the 26th of December was played for the first time the admirable École des femmes, which provoked a literary war, and caused a shower of "paper bullets of the brain." The innocence of Agnes was called indecency; the sermon of Arnaole was a deliberate attack on Christian mysteries. We have not the space to discuss the religious ideas of Molière; but both in L'École des femmes and in other plays he displays a contempt for "boiling chaldrons" and of physical hell. A brief list of the plays and pamphlets provoked by L'École des femmes is all we can offer in this place.

December 26, 1662.—École des femmes. February 9, 1663.—Nouvelles nouvelles, by De Visé. Molière is accused of pillering from Straparola.

June 1, 1663.—Molière's own piece, Critique de l'école des femmes. In this as in many other of Molière's pieces, the critics, and especially on his favourite butt, the critical marquises.

August 1663.—Zéline, a play by De Visé, is printed. The scene is in the shop of a seller of lace, where persons of quality meet, and attack the reputation of "Elémire,"—that is, Molière. He steals from the Italian, the Spanish, from Furetière's Françoise, "il lit tous les vieux bouquins," he insults the marquises, he insults Christianity, and so forth.

November 17, 1663.—Portrait du peintre is printed—an attack on Molière by Boursault. This piece is a detailed criticism, by several persons, of L'École des femmes. It is pronounced dull, vulgar, farcical, obscene and (what chiefly vexed Molière, who knew the danger of the accusation) impious. Perhaps the only bibliographical matter we gain from Boursault's play is the interesting fact that Molière was a tennis-player. On the 4th November 1663, Molière replied with L'Impromptu de Versailles, a witty and merciless attack on the criticisms of Boursault. In which Boursault was mentioned by name. The actors of the Hôtel de Bourgogne were parodied on the stage, and their art was ridiculed.

The next scenes in this comedy of comedians were:

October 36.—The Panégyrique de l'école des femmes, by Robinet.

December 7.—Réponse à l'Impromptu; ou la vengeance des marquises, by De Visé. January 19, 1664.—Le Impromptu de l'hôtel de Condé. It is a reply to a son of Montfleury.

March 17, 1664.—La Guerre comique; ou défense de l'école des femmes.
MOLIÈRE

(Feb. 10, 1670). The king might have been expected to dance in the ballet, but from Racine's Britannicus (Dec. 13, 1669) the majestic monarch learned that Nero was blamed for exhibitions of this kind, and he did not wish to out-Nero Nero. Astrology this time took the place of medicine as a butt, but the satire has become obsolete, except, perhaps, in Turkey, where astrology is still a power. The Bourgeois gentilhomme, too familiar to require analysis, was first played on the 23rd of October 1770. "The lively Fourberies de Scapin" gave the footlights" (if footlights there were) on the 24th of May 1677, and on the 7th of May we read in La Grange: "les Repenties de Spycier ont commancé." La Grange says the theatre was newly decorated and fitted with machines. A "concert of twelve violins" was also provided, the company being resolute to have everything handsome about them. New singers were introduced, who did not refuse to sing unmasked on the stage. Quinault composed the words for the music, which was by Lulli; Molière and Pierre Corneille collaborated in the dialogue of this magnificent opera, the name of which (Psyche) La Grange eventually learned how to spell. The Comtesse d'Escarbagnas (Feb. 2, 1672) was another piece for the amusement of the court, and made part of an entertainment called Le Ballet des ballets. In this play, a study of provincial manners, Molière attacked the financiers of the time in the person of M. Harpin. The comedy has little importance compared with Les Femmes savantes (Feb. 11), a severer Précieuses, in which are satirized the vanity and affectation of sciolists, pedants and the women who admire them. The satire is never out of date, and finds its modern form in Le Monde ou l'on s'ennuie, by M. Pailleron. On the 17th of February Madeleine Béjard died, and was buried at St Paul. She did not go long before her old friend and lover Molière. His Mariage forcé, founded, perhaps, on a famous anecdote of Gramont, was played on the 18th of July. On the 7th of August La Grange notes that Molière was indisposed, and there was no comedy. Molière's son died on the 11th of October. On the 22nd of November the preparations for the Mulade imaginaire were begun. On the 10th of February 1673 the piece was acted for the first time. What occurred on the 17th of February we translate from the Registre de La Grange:

"This same day, about ten o'clock at night, after the comedy, Monsieur de Molière died in his house, Rue de Richelieu. He had played a great part of the night, and spread an infected inflammation, which caused a violent cough. In the violence of the cough he burst a vessel in his body, and did not live more than half an hour or three-quarters after the bursting of the vessel. His body is buried at St Joseph's, parish of St Etienne. There is a grave-stone raised about a foot above the ground."

Molière's funeral is thus described in a letter, said to be by an eyewitness, discovered by M. Benjamin Fillon:

"Tuesday, 21st February, about nine in the evening, was buried Jean Baptiste Poquelin Molière, tapissier valet de chambre, and a famous actor. There was no procession, except three ecclesiastics; four priests bore the body in a wooden bier covered with a pall, six children in blue carried candles in silver holders, and there were lackeys with burning torches of wax. The body... was taken to St Joseph's churchyard, and buried at the foot of the cross. There was a great crowd, and some twelve hundred livres were collected among the poor. The archbishop had beforehand written that Molière should be interred without any ceremony, and had even forbidden the clergy of the diocese to do any service for him. Nevertheless a number of masses were commanded to be said for the deceased...."

When an attempt was made to exhume the body of Molière in 1792, the wrong tomb appears to have been opened. Unknown is the grave of Molière.

Molière, according to Mlle Poisson, who had seen him in his extreme old age, "neither too stout nor too thin, tall rather than short; he had a noble carriage, a good leg, walked slowly, and had a very serious expression. His nose was thick, his mouth large with thick lips, his complexion brown, his eyebrows black and strongly marked, and it was his way of moving these that gave him his comic expression on the stage...." "His eyes seemed to search the depths of men's hearts," says the author of Zelinde. The inventories printed by M. Soulé prove that Molière was fond of rich dress, splendid furniture,
and old books. The charm of his conversation is attested by the number of his friends, who were all the wits of the age, and the greater their genius the greater their love of Molière. As an actor, friends and enemies agreed in recognizing him as most successful in comedy. His ideas of tragic declamation were in advance of his time, for he set his face against the prevalent habit of ranting. His private character was remarkable for gentleness, probity, generosity and delicacy, qualities attested not only by anecdotes but by the evidence of documents. He is probably the greatest of all comic writers within the limits of social and refined, as distinguished from romantic, comedy like that of Shakespeare, and political comedy like that of Aristophanes. He has the humour which is but a sense of the true value of life, and now takes the form of the most vivacious wit and the keenest observation, now of melancholy and pity and wonder at the fortunes of mortal men. In the literature of France his is the greatest name, and in the literature of the modern drama the greatest after that of Shakespeare. Besides his contemplative genius he possessed an unerring knowledge of the theatre, the knowledge of a great actor and a great manager, and hence his plays can never cease to hold the stage, and to charm, if possible, more in the performance than in the reading.

The best biography of Molière on a level with the latest researches into his life is that in vol. x. of his works in Grands écrivains de la France (Eugène Despois and Paul Mesnard). The next best is probably that of M. Taschereau, prefixed to an edition of his works (Oeuvres complètes, Paris, 1863). To this may be added Jules Laisné's Molière (1875) in his collection of Biographies. However, we have seen that M. Louiseul is not always accurate, but he is laborious. For other books it is enough to recommend the excellent Bibliographie molièresque of M. Paul Lacroix (1875), which is an original faultless guide. The best bibliographies of Molière works for the purpose of the student is that published in Les Grands écrivains de la France (Hachette, Paris, 1874-1882). It contains reprints of many contemporary tracts, and, with the Registre de la Grange, and the Collection molièresque of M. Lacroix, is the chief source of the facts stated in this notice. In cases where the rarity of documents has prevented the writer from studying them in the original texts.

Another valuable authority is the Recherches sur Molière et sur sa famille of E. Soulié (1863). Lotheisen's Molière, sein Leben und seine Werke (Frankfort, 1880), is a reliable German compilation. Le Moliériste (Trosse, Paris, ed. by M. Georges Monval) was a monthly serial, containing notes on Molière and his plays, by a number of contributors. The essays, biographies, plays and poems on Molière are extremely numerous. The best guide to these is the indispensable Bibliographie de Molière.

MOLINA, LUI5 (1535–1600), Spanish Jesuit, was born at Cuenca in 1535. Having at the age of eighteen become a member of the Society of Jesus, he studied theology at Coimbra, and afterwards became professor in the university of Evora, Portugal. From this post he was called, at the end of twenty years, to the chair of moral theology in Madrid, where he died on the 12th of October 1600. Besides other works he wrote Liber arborii cum gratiae donis, divina praecipitans, providentiam, praedestinatione et reprobatione, concordia (4to, Lisbon, 1588); a commentary on the first part of the Summa of Thomas Aquinas (2 vols., fol., Cuenca, 1593); and a treatise De justitia et jure (6 vols., 1593–1600). It is to the first of these that his fame is principally due. It was an attempt to reconcile, in words at least, the Augustinian doctrines of predestination and grace with the SemiPelagianism which, as shown by the recent condemnation of Baulus (q.v.), had become prevalent in the Roman Catholic Church. Assuming that man is free to perform or not to perform any act whatever, Mollina maintains that this circumstance renders the grace of God neither necessary nor impossible: not impossible, for man cannot fail to bestow grace upon those who seek it in sincerity; and not necessary, for grace is a grace, although not an efficient, is still a sufficient cause of salvation. Nor, in Molina's view, does his doctrine of free-will exclude predestination. The omniscient God, by means of His "scientia media" (the phrase is Molina's invention, though the idea is also to be found in his older contemporary Fonseca), or power of knowing future contingent events, foresees how we shall employ our own free-will and treat His proffered grace, and upon this foreknowledge He can found His predestinating decrees. These doctrines, although in harmony with the prevailing feeling of the Roman Catholic Church of the period, and further recommended by their marked opposition to the teachings of Luther and Calvin, excited violent controversy in some quarters, especially on the part of the Dominicans, and at last rendered it necessary for the pope (Clement VIII.) to interfere. At first (1584) he simply enjoined silence on both parties so far as Spain was concerned; but ultimately, in 1598, he appointed the "Congregatio de auxilii Gratiae" for the settlement of the dispute, which became more and more a party one. After holding very numerous sessions, the "congregation" was able to decide nothing, and in 1607 its meetings were suspended by Paul V., who in 1611 prohibited all further discussion of the question "de auxilii," and studious efforts were made to control the publication even of commentaries on Aquinas. The Molinist subsequently passed into the Jansenist controversy (see JANSENISM).

A full account of Molina's theology will be found in Schneeman's 'Entstehung der thomismus-molinistischen Controverse,' published in the Appendices (Nos. 9, 13, 14) to the Jesuit periodical, Stimmen aus Maria-Lach. To the lay reader may be recommended Ernest Renan's article, "Les congregations de auxilii" in his Histoire du christianisme. The Molinist subsequently passed into the Jansenist controversy (see JANSENISM).

MOLINE, a city of Rock Island county, Illinois, U.S.A., in the north-west part of the State, on the Mississippi river, adjoining the city of Rock Island and near the upper end of Rock Island. Pop. (1900), 17,248, of whom 5,600 were foreign-born, principally Swedes and Belgians; (1910 census), 24,190. It is served by the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St. Paul, the Chicago, Rock Island & Pacific, and the Davenport, Rock Island & North-Western railways. A channel in the Mississippi river here, 250 ft. wide and 4 ft. deep at low water, projected in 1905, was completed in 1908; and in 1907 a lock was finished which affords a draught of 6 ft. and is a part of the 6 ft. channel improvement of Rock Island Rapids. The city has large and varied manufacturing industries; water-power is derived from a dam maintained by the Moline Water-Power Company; and there is a large electric-power plant. The most important industry is the manufacture of agricultural implements (particularly steel ploughs, which seem to have been made here first in the United States, and corn-planters). Among the other manufactures are boilers and gasolene engines, wagons and carriages, automobiles, and pianos and organs. The Chicago, Rock Island & Pacific railway has a large yard and machine shop east of the city limits, and there is a large U.S. arsenial at Rock Island. Moline was settled in 1832, laid out as a town in 1842, and was chartered as a city in 1855 and rechartered in 1872.

MOLINET, JEAN (1433–1507), French poet and chronicler, was born at Desvres (Pas de Calais). In 1475 he succeeded Georges Chastellain as historiographer of the house of Burgundy, and Margaret of Austria, governor of the Low Countries, made him his librarian. His continuation of Chastellain's chronicle, which covers the years from 1474 to 1504, remained unpublished until 1828 when it was edited (Paris, 5 vols.) by J. A. Buchon. It is far from possessing the historical value of his predecessor's work. A selection from his voluminous poetical works was published at Paris in 1531, Les Paix et Dicts de feu . . . Jehan Molinet . . . He also translated the Roman de la rose into prose (pr. Lyons, 1503). He became, in 1501, canon of the church of Notre-Dame at Valenciennes, where he died on the 23rd of August 1507. He is noteworthy as the head of the vicious Burgundian school of poetry known as the rétoriqueurs, characterized by the excessive use of puns and of puerile metrical devices. His chief disciple was his nephew, Guillaume Crétin (d. 1553), ridiculed by Rabelais as Raminagrobis, and Jean Lemaire des Belges was his friend.

See A. Wauters in the Biographie nationale de Belgique (vol. xv., 1899).

MOLINIER, AUGUSTE (1851–1904), French historian, was born at Toulouse on the 30th of September 1851. He was a pupil at the École des Chartes, which he left in 1873, and also
at the École des Hautes Études; and he obtained appointments in the public libraries at the Mazarine (1878), at Fontainebleau (1884), and at St Genève, of which he was nominated librarian in 1885. He was a good palaeographer and had a thorough knowledge of archives and manuscripts; and he soon was a first place among scholars of the history of medieval France. His thesis on leaping the École des Chartes was his Catalogue des actes de Simon et d'Amari de Montfort (inserted in vol. xxxiv. of the Bibliothèque de l'école, an important contribution to the history of the Albigenses. This marked him out as a capable editor for the new edition of L'histoire générale de Languedoc by Dom Vaisisse: he superintended the reprinting of the text, adding notes on the feudal administration of this province from 900 to 1290, on the government of Alphonso of Poitiers, brother of St Louis from 1226 to 1271, and on the historical geography of the province of Languedoc in the middle ages. He also wrote a Bibliographie du Languedoc, which was awarded a prize by the Académie des inscriptions et belles-lettres, but remained in manuscript. He also published several documents for the Société de l'Orient Latin (Itineris hierosolimitana, in collaboration with Ch. Kohler, 1885); for the Société de l'Histoire de France (Chronique normande du xvie siècle, assisted by his brother Emile, 1883); for the Collection de textes relatifs à l'enseignement de l'histoire (Vie de Louis le Gros, by Suger, 1887); for the Collection des documents inédits (Correspondance administrative d'Alfonse de Poitiers, 1894-1900); for the Recueil des historiens de la France (Oblataries de la province de Sens 1902). He also issued, among others, the Recueil des catalogues des bibliothèques publiques de France. Applying to the French classics the rigorous method used with regard to the texts of the middle ages, he published the Pensées de Pascal, revised with the original manuscript (1887-1889), and the Provinciales (1891), edited with notes. In 1893 he was nominated professor at the École des Chartes, and gave a successful series of lectures which he published (Manuel des sources de l'histoire de France au moyen âge, 1902-1906). He also taught at the École des Hautes Études. He died on the 9th of May 1904, after a short illness, leaving in manuscript a criticism on the sources of the Speculum historiale of Vincent de Beauvais.

His elder brother, Charles (b. 1843), is of some importance as an historian, particularly on the history of art and on the heresies of the middle ages. He was appointed professor of history at the university of Toulouse in 1886.

A younger brother, Émile (1857-1906), became an assistant in the print-room at the Bibliothèque Nationale, and afterwards joined the staff at the Musée du Louvre, of which he eventually became keeper, retiring in 1902. He was a well-known connoisseur of art. He organized the famous Exposition Rétrospective held at the Petit Palais in 1900, and published a number of expert volumes on enamels, ceramics and furniture.

MOLINOS, MIGUEL DE (c. 1640-1667), Spanish divine, the chief apostle of the religious revival known as Quietism, was born about 1640 near Saragossa. He entered the priesthood and settled in Rome about 1670. There he became well known as a director of consciences, being on specially friendly terms with Cardinal Odeschalchi, who in 1676 became Pope Innocent XI. In the previous year Molinos had published a volume, Guida spirituale, che disingole l'anima e la conducce per l'interior cammin all'acquisto della perfetta contemplazione e del ricco tesoro della pace interiore. This was shortly followed by a brief Trattato della cotidiana commuon. No breath of suspicion arose against Molinos until 1681, when the Jesuit preacher, Segneri, attacked his views, though without mentioning his name, in his Concordia tra la fatica e la quiete nell' orazione. The matter was referred to the Inquisition. It proceeded that the Guida spirituale was perfectly orthodox, and censured the intemperate zeal of Segneri. But the Jesuits set Father La Chaise to work on his royal penitent, Louis XIV., who prided himself on being a pillar of orthodoxy; but he was on very bad terms with Innocent XI., and soon yielded to the pleasure of discovering heresy in an intimate friend of the pope. Following on official representations by the French ambassador in Rome, who happened to be a cardinal, Molinos was arrested in May 1685. At first his friends were confident of an acquittal, but in the beginning of 1687 a number of his penitents of both sexes were examined by the Inquisition, and several were created. A report not abroad that Molinos had been convicted of moral enormities, as well as of heretical doctrines; and it was seen that he was doomed. On the 3rd of September 1687 he made public profession of his errors, and was sentenced to imprisonment for life. In the following November, Innocent signed a bull condemning sixty-eight propositions from the Guida spirituale and other unpublished writings of its author. At some date unknown in 1696 or 1697 Molinos died in prison.

Contemporary Protestants saw in the fate of Molinos nothing more than a persecution by the Jesuits of a wise and enlightened man, who had dared to withstand the petty ceremonialism of the Italian piety of the day. But Molinos was much more than the enlightened semi-Protestant that his English admirers took him to be; and his Quietism, it had been suffered to run its course would have swept aside beliefs and practices more significant than the rosaries of nuns, though it is most unlikely that he realized the consequence of his own theories. Segneri and La Chaise were not so easily deceived. They were Jesuits; and Quietism is built up on the double assumption that God reveals Himself wholly and only through Jesus, and that Jesus reveals Himself wholly and only through the Church of Rome. Luther had already broken through one link in this chain, when he broke the bond between the Roman world to come directly to Jesus, without troubling about the Church; but Luther still assumed that God could only be reached through the intermediary of Jesus. Molinos wished to find a royal road to God without any intermediaries at all. The Reformation maintained that the Church, so far from being a help, was a hindrance, to union with Jesus; whereas Molinos welcomed both Church and Jesus as helps to union with God, always provided that the believer treated both as means to an end beyond themselves. In other words, he held that there was a triple stage in piety. Beginners gave themselves wholly to the Church. At the second step came devotion to Jesus. At the third and highest stage both Church and Jesus were left behind as deiformes, sed non Deus, and God remained alone.

But how could a finite being bring himself into direct relation with Infinity? Following very ancient precedents, Molinos fell back on those phenomena of our consciousness which seem least within our own power. The less sense of proprietorship we had in a thought or action—the less it was the fruit of our deliberate will—the more certain might we be that it was divinely inspired. But what state of mind is most likely to be visited by these spontaneous illuminations? Plainly the state that Molinos calls the "soft and savoury sleep of nothingness"; where the soul is content to fold its hands, and wait in dreamy musing till the message comes; meanwhile it will think, do, will as little as it can. For this reason disinterested love became the great hall-mark of Quietist sanctity. Why it is unfitted to be a test of sanctity in general has been explained at length by Bossuet in a remarkable Instruction on l'état d'oraison, published while the Quietist controversy was at its height. But, although Molinos's system did not long survive him, he had at least the double merit of courage and tenacity. Few writers have struggled so long and so hard to disengage the essence of religion from its transitional embodiment in an historical creed.

The Guida spirituale was published in Italian in 1675, and has been reprinted. An English translation appeared in 1688; it has been praised by E. Scharling as "excellent" (Scharling, Michael de Molinos (Ger. trans. from Danish; Gotha, 1855). H. Hepp, Geschichte der quietistischen Mystik (Berlin, 1872). H. Delacroix, Études d'histoire et de psychologie du mysticisme (Paris, 1908). There is a brilliant, but very fanciful, account of Molinos and his doctrines in J. H. Shorthouse's romance, John Ingles (St C.)

MOLIQUE, WILHELM BERNHARDT (1802—1869), German violinist and composer, was born at Nuremberg on the 7th of October, 1802, and learnt the violin at Munich under Pietro
MOLKOV—MOLLUSCA

J. Rovelli. In 1826 he became music-director at Stuttgart. As a composer for the violin Molqué was commonly compared with Spohr. He also wrote some charming songs. He died at Cannstadt in 1869.

MOLKO (1500-1532), a Marano kabbalist, who proclaimed the advent of the Messiah. He was associated with David Reuben, who also made Messianic claims. Molko, after a chequered career, was condemned to death by the ecclesiastical court at Mantua. He was offered his life by the emperor Charles V. if he would return to Christianity, in which he had been educated. He refused, and died at the stake. (I. A.)

MÖLLENDORF, RICHARD JOACHIM HEINRICH VON (1724-1816), Prussian soldier, began his career as a page of Frederick the Great in 1740. The outbreak of the Silesian wars gave him his first opportunity of seeing active service, and the end of the second war saw him a captain. In the Seven Years' War his brilliant conduct at the churchyard of Leuthen (1757) and at Hochkirch won him his majority. In 1760 his exertions retrieved the almost lost battle of Torgau, and the last success of the great king was won by the brigades of Prince Wied and Möllendorf (now major-general) at the Burkersdorf heights. Seventeen years later, as lieutenant general, he won at Breslau the last successes of the successful successes of the Prussian army under Frederick.

In the hopes of peace he occupied considerable posts, being made governor of Berlin in 1783. Promoted general of infantry in 1787, and general field marshal in 1793, he commanded the Prussian army on the Rhine in 1794. In the disastrous campaign of Jena (1806) Möllendorf played a considerable part, though he did not actually command a corps. He was present with the king at Auerstädt, falling into the hands of the French in the débacle which followed. After his release he passed the remainder of his life in retirement. He died in 1816.

MOLLIER, NICOLAS FRANÇOIS, Count (1758-1850), French financier, was born at Paris on the 28th of February 1758. The son of a merchant, he early showed ability, and entered the ministry of finance, where he rose rapidly; in 1784, at the time of the renewal of the arrangements with the farmers-general of the taxes, he was practically in chief in that department and made terms advantageous to the national exchequer. Under Calonne he improved the returns from the farmers-general; and he was largely instrumental in bringing about the erection of the office walls of Paris in place of the insalubrious and unhealthy hovels on the quays. He was, in fact, the author of some of the restrictions on imports, as came about in the famous Anglo-French commercial treaty of 1786, to the conclusion of which he contributed in no small measure. The events of the French Revolution threatened at times to overwhelm Mollien. In 1794 he was brought before the revolutionary tribunal of Evreux as a suspect, and narrowly escaped the fate that befell many of the former farmers-general. He retired to England, where he observed the financial measures adopted at the crisis of 1796-1797. After the coup d'état of Brumaire (November 1799) he re-entered the ministry of finance, then under Gaudin, who entrusted him to important duties as director of the new caisse d'amortissement. Napoleon, hearing of his abilities, frequently consulted him on financial matters, and after the Proclamation of the Empire (May 1804) made him a councillor of state. The severe financial crisis of December 1805 to January 1806 served to reveal once more his sound sense. Napoleon, returning in haste not long after Austerlitz, dismissed Barge-Marmois from the ministry of the treasury and confided to Mollien those important duties. He soon freed the treasury from the interference of great banking houses. In other respects, however, he did something towards curbing Napoleon's desire for a precise regulation of the money market. The conversations between them on this subject, as reported in Mollien's Mémoirs, are of high interest, and show that the ministry had a far truer judgment on financial matters than the emperor, who often twitted him with being an idéologue. In 1808 Mollien was awarded the title of count. He soon came to see the imposibility of the measures termed collectively "the continental system"); but his warnings on that subject were of no avail. After the first abdication of the emperor (April 11, 1814), Mollien retired into private life, but took up his ministerial duties at the appeal of Napoleon during the Hundred Days (1815), after which he again retired. Louis XVIII. wished bringing him back to office, but he resisted these appeals. Nominated a peer in 1819, he took some part in connexion with the annual budgets. He lived to see the election of Louis Napoleon as president of the Second Republic, and died in 1850, with the exception of Pasquier, the last surviving minister of Napoleon I.

MOLLUSCA, one of the great "phyla," or sub-kingdoms, of the animal kingdom or kingdom. The shell-bearing forms belonging to this group which are known to Linnaeus were replaced by him in 1748 in the third order of his class Vermes under the name "Testacea," whilst the Echinoderms, Hydroids and Annelids, with the naked Mollusca, formed his second order termed "Zoophyta." Ten years later he replaced the name "Zoophyta" by "Mollusca," which was thus in the first instance applied, not to the Mollusca at present so termed, but to a group consisting chiefly of other organisms. Gradually, however, the term Mollusca became used to include those Mollusca formerly placed among the "Testacea," as well as the naked Mollusca. It is important to observe that the term mollusca, of which Mollusca is merely a latinized form, was used by Aristotle to indicate a group consisting of the cuttle-fishes only.

As now classified, the Mollusca consist of the following subdivisions:

Grade A.—Isopolea.

Class I.—Amphinea (see Chiton).

Class B.—Prothoripidoglossonothorapod.

Class II.—Gastropoda (q.v.).

Class III.—Scaphopoda (q.v.).

Class IV.—Lamprometra echinodermata (q.v.).

Grade C.—Siphonopoda.

Class V.—Cephalopoda (q.v.).

History of Classification.—The definite erection of the Mollusca into the position of one of the great primary groups of the animal kingdom is due to George Cuvier (1788-1800), who largely occupied himself with the dissection of representatives of this type. An independent anatomical investigation of the Mollusca had been carried on by him in the meantime. In 1791 his publications included a list of the sub-kingdoms then known, and his second list (1798) of the sub-kingdoms of which his researches were not published until after his death (1817), and were followed by the beautiful works of another Neapolitan zoologist, the illustrious Delle Chiage.

The term mollusca from Mollusca, as defined by Cuvier, included the following classes of shellfish: (1) the cuttles or poulps, under the name Cephalopoda; (2) the snails, whelks and slugs, both terrestrial and marine, under the name Gastropoda; (3) the sea-butterflies or winged-snails, under the name Pteropoda; (4) the clams, mussels and oysters, under the name Acanthoda; (5) the lamp-shells, under the name Brachiopoda; (6) the sea-squirts or ascidians, under the name Nuda; and (7) the barnacles and sea-arms, under the name Cirripedia.

The main limitation of the section of the phylum Mollusca, as laid down by Cuvier, and the chief divisions thus recognized within its limits by him, hold good to the present day. At the same time, three of the classes considered by him as Mollusca have been one by one removed from that classification and too-little honoured group. The first of Cuvier's classes to be removed from the Mollusca was that of the Cirripedia. Their affinities with the lower Crustacea were recognized by Cuvier and his contemporaries, but it was one of the brilliant discoveries of the past forty years, that this remarkable and too-little honoured naturalist, J. Vaughan Thompson, of Cork, decided their position as Crustacea. The metamorphoses of the Cirripedidae were described and figured by him in 1830 in a very complete manner, and the legitimate conclusion as to their affinities was formulated by him. Thus it is to Thompson (1830), and not to Burne-Mirion (1834), as erroneously stated by Keferstein, that the merit of this discovery belongs. The next class to be removed from Cuvier's

* These figures refer to the Bibliography at the end of the article.
MOLLUSCA

Mollusca was that of the Nuda, better known as Tunicata. In 1866 the Russian embryologist Kowalevski started the zoological world with a minute account of the developmental changes of A. texta, one of the Tunicata, and it became evident that the affinities of that class with the Vertebrata, whilst their structural affinities with Mollusca were only superficial. The last class which has been removed from the Cuvierian Mollusca is that of the Lamp-shells or Brachiopoda. The history of its dissociation is connected with that of the class, viz., the Polyzoa or Bryozoa. It was first to be treated by Haeckel in the recent treatise on the Mollusca between Cuvier's date and the present day. The name of J. Vaughan Thompson is again that which is primarily connected with the history of a Molluscan class. In 1830 he pointed out that among the numerous kinds of Bryozoa at that time described there were many which had a peculiar and more elaborate type of organisation, and for these he proposed the name Polyzoa. Subsequently they were termed Bryozoa by Ehrenberg (1831), in 1835, and by O. H. Haeckel in 1846, demonstrated the affinities of the Polyzoa with the Molluscan class Brachiopoda, and proposed to associate the three classes Brachiopoda, Polyzoa and Tunicata in a large group Molluscoidea, co-ordinate with the remaining classes of Cuvier's Mollusca, and which formed a group retaining the name Mollusca. By subsequent writers the Polyzoa have in some cases been kept apart from the Mollusca and classed with the Vetebretata; whilst others have, together with the Brachiopoda, been regarded as the Vertebrata. Consequently Haeckel in his great work on the Phyla of Metazoa has established the conclusion that the agreement of structure supposed to be obtained between Polyzoa and true Mollusca is delusive; and accordingly they, together with the Brachiopoda, were removed from the Molluscan phylum by Lankester and later by Haeckel (1847) in the fourth edition of his great work on the various phyla (p. 84). The reverse has been carried out by Gegenbaur, and more recently by Spencer, amongst German anatomists, we are indebted for epoch-making researches of the same kind. In England, Owen's anatomy of the pearly nautilus, Huxley's researches on the Protozoa, Lankester and Lankester's embryological investigations, and in France, contributions of a most important character have been made by the Belgian zoologist, Dr Paul Pelseneer, who has made the Mollusca his special study.

General Characters of the Mollusca.—The forms comprised in the various groups, whilst exhibiting an extreme range of variety in shape, may be seen on comparing an oyster, a cuttle-fish, and a sea-slug such as Doris; whilst adapted, some to life on dry land, others to the depths of the sea, others to rushing streams; whilst capable, of some swimming, others of burrowing, crawling or jumping, some, on the other hand, fixed and immobile; some amongst the most formidable of carnivores, others feeding on vegetable mud, or on the minutest of microscopic organisms—yet all agree in possessing in common a very considerable number of structural details which are not possessed in common by any other animals.

The structural features which the Mollusca do possess in common with other animals belonging to other great phyla of the animal kingdom are those characteristic of the Coelomata, one of the two great grades (the other and lower being that of the Coelenterata) into which the higher animals, or Metazoa as distinguished from the Protozoa, are divided. The Metazoa all commence their individual existence as a single cell or plasid, which multiplies itself by transverse division. Unlike the cells of Protozoa, these embryonic cells of the Metazoa do not remain each like its neighbour and capable of independent life, but proceed to arrange themselves into two layers, taking the form of a sac. The cavity of the two-cell-layered sac or diblastula thus formed is the primitive gut or arch-enteron. In the Coelentera, whatever subsequent changes of shape the little sac may undergo as it grows up to be polypl or jelly-fish, the original arch-enteron remains as the one cavity pervading all regions of the body. In the Coelomata, on the other hand, there is another cavity, dividing the body-wall into two layers: an internal layer surrounding the gut, and an external layer. This cavity is excavated in a third mass of cells distinct from the cells lining the gut, forming the endoderm, and the cells covering the surface of the body, the ectoderm. This third mass of cells is the mesoderm. The Mollusca agree in being coelomate with the phyla Veretbrata, Platychelms (flat-worms), Echinodermura, Appendicularia (insects, ringed-worms, &c.), and others—in fact, with all the Metazoa except the sponges, corals, polyps, and medusae.

In common with all other Coelomata, the Mollusca are at one period of life possessed of a prostomium or region in front of the mouth, which is the essential portion of the "head," and is connected with the property of forward locomotion in a definite direction and the steady carriage of the body (as opposed to rotation of the body on its long axis). As a result, the Coelomata, and with them the Mollusca, present (in the first instance) the general condition of body known as bilateral symmetry; the dorsal is differentiated from the ventral surface, whilst a right and a left side similar, to, or rather the complements of, one another are permanently established. In common with all other Coelomata, the Mollusca have the mouth and first part of the alimentary canal which leads into the met-enteron formed by a special invagination of the outer layer of the primitive body, not to be confounded with that which often, but not always, accompanies the animal mouth of the Protozoa. This met-enteron; this invagination is termed the stomodaeum. Similarly an anal aperture is formed in connection with a special invagination which meets the hinder part of the met-enteron, and is termed the proctodaeum.

The coelom is primarily and essentially the generative cavity: the reproductive cells arise from its walls, i.e. from the coelomic epithelium. True nephridia do not primarily open into the coelom, as was formerly taught, but are intra-cellular ducts in the mesoderm. Such organs are absent in Mollusca in the adult state, but a pair of nephridia usually occurs in the larva. The coelom opens to the exterior by ducts which are primarily genital ducts by which the ova or sperms are discharged. These ducts, however, as well as the coelomic epithelium, may assume excretory functions. In Mollusca the coelom is reduced and consists of two parts, the pericardial cavity which surrounds the heart, and the cavity of the gonads or generative organs. There is usually one pair of coelomic ducts leading from the
pericardium to the exterior, and these are the excretory organs of kidneys, formerly known as the organs of Bojanus. The walls of the pericardium are also excretory in parts, these parts forming the pericardial glands. In the majority of Mollusca the gonads are provided with a pair of ducts of their own. There are thus two pairs of coelomic ducts. This fact gives rise to the question whether the Mollusca are to be regarded as primitively segmented animals or not. In animals which exhibit typical segmentation or metamersism, such as segmented worms (Chaetopoda), each segment or metamere possesses its own coelomic cavity, a pair of coelomic ducts, and a pair of nephridia. The structure of the Mollusca in the greater number of cases agrees with the hypothesis that the primitive form was unsegmented, and therefore had but one pair of coelomic ducts and one pair of nephridia. In existing forms the latter disappear in the adult. In the most primitive forms of several classes there are no distinct genital ducts, the gonads when mature discharging into or through the kidneys. Among the Gastropoda, in the Aspidobranchia, there is no genital duct, and the gonad opens into the right kidney; in the more modified forms the left kidney alone is functional, the right has been converted into a duct. Among the Lamellibranchia again the kidneys serve as genital ducts in the Protobranchia and some Filibranchia. In the higher forms the opening of the gonad is shifted more and more towards the external aperture of each kidney until finally it is situated on the external surface, and thus the gonad secondarily acquires an independent aperture. In the Scaphopoda there is no distinct genital duct, the relations are as in Aspidobranchia. Among the Amphineura we find one pair of coelomic ducts in the Aplacopora, two pairs in the Chitons. In the former the genital coelom and the pericardial coelom are continuous and the reproductive cells escape by the renal ducts. In the Chitons or Polyplacopora, on the other hand, the two cavities are separate, and there are independent genital ducts. It is possible therefore to regard the latter condition as secondary, and to conclude that the separate genital ducts have been derived from the original single pair of coelomic ducts, as in Lamellibranchia.

The Cephalopoda, however, do not harmonize so well with this view. The earliest forms of this class geologically are the Nautiloidea. Assuming that these ancestral forms resembled the existing Nautilus in their internal anatomy, they had two pairs of renal ducts and one pair of genital ducts, which would apparently indicate, not a single metamere or unsegmented body, but three metameres. There are however only two pairs of branchiae. The Dibranchia, with only one pair of branchiae, one pair of renal organs, and one pair of genital ducts, are much more recent, not appearing till the end of the Secondary epoch, and therefore must be regarded as descended from the Tetrabranchia. The latter are represented in the Upper Cambrian formations, together with Lamellibranchia and Gastropoda, and there are no earlier Molluscan fossils than these. Palaeontology therefore throws no light on the question whether the metameric or the unsegmented Mollusca were the earlier. The development of the Cephalopoda affords at present no better evidence that the metamersism is secondary. That of Nautilus, which would be most important in this inquiry, is unfortunately still unknown. In the Dibranchia true nephridia have not been detected in the embryo, nor has it been shown that the genital ducts are derived from the renal tubes. On the other hand, there is no evidence that the forms which show no metamersism, such as the Gastropoda, are descended from metameric ancestors. On the whole, then, the most probable conclusion is that the original ancestral form of the Mollusca was unsegmented, possessed one pair of true nephridia, and one pair of coelomic ducts whose function was to conduct the generative products to the exterior. The chief types of Mollusca were already differentiated at the beginning of the geological record, and the metamersism which occurs in the Cephalopoda has been evolved within the limits of that class.

**External Characters.**—The characteristic organs of Mollusca are the mantle and shell, the foot, the ctenidia and the radula, of which all but the last are external. The original form was bilaterally symmetrical, and this symmetry is retained in all the classes except the Gastropoda. At the anterior end the head is differentiated; it bears the sense-organs, and contains the muscular pharynx within which is the radular apparatus. The rest of the body consists of the foot ventrally and the visceral mass dorsally. The foot is a muscular mass without cuticle or skeleton, excepting certain cuticular structures such as the byssus of Lamellibranchs and the operculum of Gastropods, which do not aid in locomotion. The foot is usually the only organ of locomotion. It corresponds to the ventral part of the body-wall in other animals. The muscular tissue of the dorsal body-wall is much reduced and the integument here is thin and soft. The external epithelium of the dorsal region secretes the shell. Between the edge of the shell and the foot there is a groove or cavity, chiefly developed laterally and posteriorly. The dorsal border of this groove is extended outwards and downwards as a fold of the integument. There is some confusion of terms here: some writers call the free fold the mantle or pallium, and this is the proper use of the term; but others apply the term to the whole of the dorsal integument, including both the projecting fold and the part covering the visera. The shell extends to the edge of the mantle-fold, and the cavity between the mantle and the side of the body is the pallial chamber. This chamber serves two purposes: it is primarily

the respiratory cavity containing the gills, but it also serves
to enclose the body so that the latter is surrounded by the
shell, from which the head and foot can be protruded at the will
of the animal.

The shell consists of an organic basis the substance of which is
called concholin, impregnated with carbonate of lime, with a
small proportion, 1–2 % of phosphate of lime. On the outside
of the shell is a non-calciﬁed layer of concholin called the
periostracum, secreted by the thickened edge of the mantle.

The zone of the external surface of the mantle within the edge
secretes a layer formed of prisms of calcite; the rest of the
epithelium from this zone to the apex secretes the inner layer
of the shell, composed of successive laminae; this is the nacreous
layer, and in certain species has a commercial value as nacre
or mother-of-pearl.

Thus the growth of the shell in extent is due, and exceptions to the pteridous layer at the edge, its growth
in thickness to new layers of nacre deposited on its inner surface.

In many cases in various classes the mantle is reﬂected over
the edges of the shell, so as to cover more or less completely
its outer surface. When this covering is complete the shell is
contained in a closed sac and is said to be “internal,” but
the sac is lined by ectoderm and the shell is always morpho-
logically external. In one or two cases the epithelium of the
foot secretes a calciﬁed shell, which is either free as in Argonata
or adherent as in Hipponyx.

The ctenidia (ﬁg. 1) are the branchial organs of the Molusca.
In the primitive condition there is one on each side in the
mantele cavity, towards the posterior end of the body. Each
is an outgrowth of the body-wall at the side of the body, and
consists of an axis containing two main vessels, an afferent
and efﬁcient, and bearing on either side a series of transverse plates
whose blood-sinususes communicate with the vesicles of the
mantle. The afferent vessel of the ctenidium is formed by the
vena cava or principal blood-sinus of the body, the efferent
vessel opens into the atrium of its own side. Near the base
of the ctenidium is a patch of sensory epithelium innervated from
the branchial nerve, forming a sense-organ called the opho-
sphadium, whose function is to test the water entering the
branchial cavity. The branchial current is maintained by the cilia
which cover the surface of the ctenidium, except in Cephalopoda,
in which cilia are absent and the current is due to muscular action.

Thus in the primitive mollusc the mantle-cavity contains a
symmetrical group of structures at the posterior end of the
body, and this group of structures is called the pallial complex.
It contains the anus in the middle, a renal organ and renal
aperture on each side, a mantle, a ctenidium outside or anterior
to the renal organ, an ophosphadium being situated at the
base of the ctenidium.

Internal Anatomy: Digestive Tube.—In primitive Molusca the mouth
and anus are the two extremities of the body, but the anus
may be brought to an anterior position by a ventral ﬂexion, compli-
cated in Gastropoda by a lateral torsion. The alimentary tube
consists of three regions: ﬁrstly, the anterior buccal mass, the
oesophagus, of ectodermic origin, and therefore bearing cuticular
structures, namely the jaws and radula; secondly, the mid-gut, of
dermogastic origin and including the stomach and liver; and, thirdly,
the hind-gut or rectum. The buccal mass, or buccal cavity, is composed of
the radula, or radular apparatus, secreted by the buccal ganglion,
and moved by an apparatus of cartilage and muscles. It was present
in the ancestral mollusc, occurs in nearly all archaic types, and is
only absent in the classes Bivalvia and Gastropoda, in a few almost
absent in insects, reptiles and birds. The afferent blood-vessels
are the cerebral arteries which arise at each side of the cerebral
cavity and pass backwards between the pleural ganglia to the
cardiac region of the pericardium, where they communicate
with the vena cava, one vessel on each side. The efﬁcient blood
vessels are derived from the posterior vena cava. The cerebral
arteries divide into cerebral and pleural branches.

The visceral ganglionic system is divided into the cerebro-
nervous and the suboesophageal. The cerebro-nervous system is
represented, not by the collar region mentioned in the above
description, but by the commissures connecting the cerebral and
pedal ganglia. The visceral ganglia are represented, not by the
physiological activity of the organs, but by the fact that the
epithelium of the foot is not innervated from the cerebral
ganglia, but from the pedal ganglia. This is the reason why
the pedal ganglia are present in the visceral ganglia of the
Gastropoda.

The cephalopedal nerves are the nerves of the foot from
the pedal ganglia. It is a curious fact that the whole nervous
system of the mollusc is innervated only by the pedal ganglia,
and the cephalopedal nerves only communicate with the
pedal ganglia. The cephalopedal nerves are the internal
nerves of the mollusc, and are in all cases divided into the
ophosphadium nerves, which supply the ophosphadium,
and the visceral nerves, which supply the visceral or visceral
ganglionic system. The cephalopedal nerves are the nerves
which supply the sense-organs of the foot, and are the nerves
which supply the sense-organs of the foot in all cases.

The special sense-organs are a pair of eyes on the head, a pair
of otocysts or statocysts, and a pair of otocysts which have already
been mentioned. In certain cases accessory eyes are also present,
and are termed ocelli, or the radula and radula-helping
organs. The cephalopedal nerves are the nerves of the foot;
the cephalopedal nerves are the nerves of the foot in all cases;
the cephalopedal nerves are the nerves of the foot; the cephalopedal

in later and special lines of descent—show approximately the following history. By division of the egg-cell a mulberry-mass of embryonic-cells is formed (morula), which dilates, forming a one-cell-layered sac (blastula). By invagination one portion of this sphere becomes tucked into the other—as in the preparation of a woven night-cap for the head. The orifice of invagination (blastopore) narrows, and we now have a two-cell-layered sac—the gastrula. The invaginated layer is the enteric cell-layer or endoderm; the outer cell-layer is the dermic cell-layer or ectoderm. The cavity communicating with the blastopore and lined by the endoderm is the archenteron. The blastopore, together with the whole embryo, now elongates. The blastopore then closes along the middle portion of its extent, which corresponds with the later developed foot. At the same time the stomodeum, or oral invagination, forms around the anterior remnant of the blastopore, and the proctodaeum, or anal invagination, forms around the posterior remnant of the blastopore. There are, however, variations in regard to the relation of the blastopore to the mouth and to the anus which are probably modifications of the original process described above.

In eggs which contain a larger quantity of food-yolk, the process by which the endoderm is enveloped by the ectoderm is somewhat different. Segmentation in these is very unequal, and results in the formation of small cells called micromeres and large cells called megameres, as in fig. 4. As the micromeres become more numerous they gradually envelop the megameres until the latter are completely enclosed. The gastrula is in these cases said to be formed by epiboly. Between ectoderm and endoderm a third intermediate cell-layer

coelom is formed as a single cavity, and renal and generative organs are formed from its walls. This is the primitive method, but in other cases the organs mentioned may be formed separately in the mesoderm. The renal organs are tubular outgrowths of the pericardial parts of the coelom; the reproductive cells are derived from cells lining the generative portion.

The external form of the embryo meanwhile passes through highly characteristic changes, which are on the whole fairly constant

Throughout the Mollusca. A circle of cilia forms when the embryo is still nearly spherical in an equatorial position. As growth proceeds, one hemisphere remains relatively small, the other elongates and enlarges. Both mouth and anus are placed in the larger area; the smaller area is the pro stomum simply; the ciliated band is therefore in front of the mouth. The larval form thus produced is known as the trochosphere. It exactly agrees with the larval form of many Chaetopod worms and other Coelomata. Most remarkable is its resemblance to the adult form of the Wheel animals, or Rotifera, which retain the prae-oral ciliated band as their chief organ of locomotion and prehension throughout life. So far the young mollusc has not reached a definitely molluscan stage of
development, being only in a condition common to it and other Cooelomata. It now passes to the veliger phase, a definitely molluscan form, in which the disproportion between the area in front of the ciliated circllet and that behind it is very greatly increased, so that the former area is simply an emarginated region of the head fringed with cilia. It is termed the "velum," and is frequently drawn out to Mollusca generally, but acquires characters peculiar to the particular class to which its parents belong. For the later development therefore the articles on the several classes must be consulted.

Relations between the Classes.—From the preceding discussion an idea may be formed of the primitive characters of the Phylum

(From Ballo, after Bohmertzky.)

Fig. 4.—Early Stages of division of the Fertilized Egg-cell in Nassa mutabilis.

A, The egg-cell has divided into two spheres, of which the lower contains more food-material, whilst the upper is again incompletely divided into two smaller spheres. Resting on the dividing upper sphere are the eight-shaped "directive corpuscles," better called "preseminal outcast cells or apoblasts," since they are the result of a cell-division which affects the egg-cell before it is impregnated, and are mere refuse, destined to disappear.
B, One of the two smaller spheres is reunited to the larger sphere.
C, The single small sphere has divided into two, and the reunited mass has divided into two, of which one is oblong and practically double, as in B.
D, Each of the four segment-cells gives rise by division to a small pellicul cell.
E, The cap of small cells has increased in number by repeated formation of pellicul cells in the same way, and by division of those first formed. The cap will spread over and enclose the four segment-cells.

Into lobes and processes. As in the Rotifera, it serves the veliger larva as an organ of locomotion. The body of the veliger is characterized by the development of the visceral hump on one surface, and by that of the foot on the other. Growth is greater in the vertical dorso-ventral axis than in the longitudinal oro-anal axis; consequently the foot is relatively small and projects as a blunt process between mouth and anus, which are not widely distant from one another, while the antipedal area projects in the form of a great hump or dome. In the centre of this antipedal area there has appeared (often at a very early period) a gland-like depression or follicle of the integument. This is the primitive shell-sac discovered by Lankester in 1871, and shown by him to precede the development of the percurrent shell in a variety of molluscan types. The shell-sac is bounded by a ridge of ectodermic cells. This ridge forms the edge of the shell-secreting epithelium, and therefore of the mantle, since the shell extends to the edge of the mantle. The shell-gland, as developed from its point of origin as an ectodermic thickening, may be only slightly concave or may be deeply invaginated and then evaginated.

In the larvae of several Gastropoda and Lamellibranchia occur excretory organs which have the characters of true nephridia. There is a single pair of these organs situated immediately behind the velum. They agree with primitive nephridia in being of ectodermic origin, in consisting of perforated cells in linear series, and in having no communication with the coelom. The inner end of each of these organs consists of a flame-cell, i.e. a cell with an internal cavity containing a vibrating filament or flagellum. They are best developed in the Pulmonata; in some cases they are very rudimentary and may be destitute of an external opening. They invariably disappear before the adult stage is reached, but their presence in the larva is evidence that the ancestral mollusc possessed a pair of true nephridia quite distinct from the coelomic excretory organs, which are so characteristic of existing forms in the adult condition. The ctenidia, it will be observed, have not yet been mentioned, and they are indeed the last of the characteristic Molluscan organs to make their appearance. They arise as outgrowths of the sides of the body within the cavity formed by the development of the mantle. The veliger, as soon as its shell has attained some extent and begins to assume definite shape, is no longer of a form common

(From Gegenbaur.)

Mollusca, and it is possible to construct a diagrammatic mollusc, as was done by Lankester, which will possess these primitive features. The figure here given represents such a hypothetical form according to present views. We cannot assert that this was in all respects the condition of the common ancestor, as will be seen when we attempt to derive the various sub-types from it. In the Amphineura the nervous system, having no

Separate ganglia and no ventral visceral commissure, may be still more primitive. The metameric repetition of the shell-plates and of the ctenidia are probably special modifications, but it is difficult to explain the spicules of the dorsal integument except as a condition more primitive than the shell itself. The Prothripodoglossophorina are distinguished by the separation of the genital coelom from the pericardium, and by the long visceral commissure passing ventral to the intestine. The Lamelibranchia have markedly diverged from the original type by the adoption of filtration as a method of feeding. This has
led to the loss of the radula, and is accompanied by the division of the shell into two valves. The peculiarities of the Gastropoda are all due to the torsion of the shell and body. The Cephalopoda can be derived without much difficulty from the schematic mollusc, if we assume that some metameric repetition of organs has occurred, as explained above in reference to the coelom. The foot has been developed into long processes which have extended in a circle round the mouth; all the ganglia, including the visceral, have been concentrated around the oesophagus.

Habits and Distribution.—More than 28,000 species of living Molluscs have been distinguished, of which more than half are Gastropods. They are essentially aquatic animals, and the majority live in the sea. Some, like many Cephalopods and the Pteropods, are pelagic or free-swimming; others creep or lie on the sea bottom. Some are littoral, living between tide-marks; others are found at various depths, up to 2800 fathoms. A few species have invaded the fresh waters, while the pulmonate and terrestrial Gastropods are distributed over the whole surface of the land in all latitudes and to a height of 15,000 ft. As a rule Molluscs are free and more or less active, but many Lamellibranchs are sedentary, and a few of these and of Gastropods are permanently fixed to their habitat. Commensalism occurs in a few instances, but parasitism either external or internal is rare. The latter is confined to certain Gastropods which live in Echinoderms and are extremely degenerate in structure. Protective resemblance is exhibited by some Nudibranch Gastropods which have assumed the color and appearance of their habitat.

Mollusca, a name long employed to denote a division of the animal kingdom which contained Brachiopods (q.v.), Polyzoa (q.v.), and Tunicata (q.v.), the members of the three groups having been supposed to resemble the Mollusc. As it is now known that these groups have no relation to molluscs, and very little to one another, the name Mollusca has been abandoned.

Molly Maguires, an Irish American secret society which maintained numerous branches in the anthracite coal regions of Pennsylvania, U.S.A., from 1854 to 1877, and perhaps later. The name was imported from Ireland, where it had been used to designate one of the Ribbon societies that devoted its energies to intimidating and maltreating process servers and the agents of landlords, and whose greatest activity was between 1835 and 1855. The Irish society of Molly Maguires seems to have been organized in 1845 in the barony of Farney, Co. Monaghan, to co-operate with the ribbonmen, and its membership seems to have been confined to the very lowest classes. The Molly Maguires of Pennsylvania consisted of similar classes of Irishmen, but there seems to have been no connexion between the two societies. Every member of the American organization was also a member of the Ancient Order of Hibernians, an association organized for benevolent purposes, and having branches throughout the United States and Great Britain. To the Ancient Order of Hibernians the Ancient Order of the Molly Maguires, representing the best persons of Irish birth or descent, who were Roman Catholics, and whose parents were Roman Catholics; but notwithstanding this requirement, the organization—being a secret society—was under the ban of the Catholic Church. At the head of each division or lodge there was a "body master," who communicated directly with a county delegate; the county delegates reported to the state delegate, and the state delegates reported to a national delegate. The supervision of the whole order was vested in a "Board of Erin," meeting quarterly in England, Ireland or Scotland, and at each meeting arranging a new code of signals and passwords, which were communicated to the national delegate in the United States by the steward of a transatlantic steamer, and thence were transmitted to the various subdivisions. In the mining districts of Pennsylvania the organization fell under the control of a lawless element,
which created the inner order of "Molly Maguires," with the object, it appears, of intimidating the Welsh, English, and German miners, and of ridding the region of mine superintendents, bosses and police who should make themselves in any way objectionable to members of the order. Any member having a grievance might lay a formal complaint before his "body master," who thereupon conferred with the officers of the neighbouring divisions and secured members from a distance to make away with the offending person. Under this system the crimes in a given district were always committed by strangers rendering identification of the criminal difficult and escape easy. The society grew in strength during the Civil War, when the increased demand for coal caused an influx of miners, many of them lawless characters, into the coal-fields, and in 1862-1863 it opposed enlistments in the Federal Army and roughly treated some of the enlisting officials. After the war its activity was shown by an increasing number of assassinations, burnings and other outrages, until by 1875 it completely dominated the mining classes and forced a general strike in the coal regions. After repeated efforts to bring the criminals to justice had failed, Franklin B. Gowen (1856-1890), president of the Philadelphia and Reading Coal Company, enrolled, in 1876, an Irish Catholic and a Pinkerton detective (who some thirty years later attracted attention in the investigation of the assassination of Governor Steunenberg of Idaho), to the mining region in 1873; he joined the order, lived among the "Molly Maguires" for more than two years, and even became secretary of the Shenandoah division, one of the most notoriously criminal lodges of the order. The evidence he secured led to the arrest, conviction, and execution or imprisonment of a large number of members during the years 1876-1877, and subsequently the outrages ceased and the society was disbanded.

MOLOC, or MOLECH (in Hebrew, with the doubtful exception of 1 Kings xi. 7, always "the Molech"), the name, or title of name, of the deity which the men of Judah in the last ages of the kingdom were wont to propitiate by the sacrifice of their own children. According to the Hebrew connotations it might simply be read "the king" (molek), an appellation for the supreme deity of a Semitic state or tribe. The traditional pronunciation (Moòj), which goes back as far as the Septuagint version of Kings, probably means that the old form was perverted by giving it the "swells of a molek" (shame," the contemptuous name for Israel). In 1 Kings xi. 7 (see above) it is the name of the god of the Ammonites, elsewhere called Milcom or Malcam; but it appears from 2 Kings xxii. 10, 13 that the worship of Milcom at the shrine set up by Solomon was distinct from Molech worship, and the text should probably therefore be emended to the longer form (so the Septuagint).

The phrase employed in speaking of these sacrifices is that of dedication—"to make one's son or daughter pass through (or by means of) fire to (the) Molech" (2 Kings xxii. 10; but elsewhere without the words "through fire" Lev. xvii. 21); and it appears from Jer. vii. 31, xix. 5; Ezek. xvi. 20 seq., that this phrase denotes a human holocaust, and not, as sometimes has been thought, a mere consecration to Molech by passing through or between fires, as in the Roman Pudicita and similar rites elsewhere (on which see Frazer, Golden Bough, 2nd ed., ii. 40 sqq., iii. 237 sqq.). Human sacrifice was common in Semitic heathenism, and at least the idea of such sacrifices was not unknown to Israel from early times (see ISAAC; JEPHETHAH).

We learn from 2 Kings iii. 27 that the picaresque sacrifice of his enemies was the last offering which the king of Moab made to deliver his country. Even the historian ascribes to this act the effect of rousing divine indignation against the invading host of Israel; it would not, therefore, be surprising if under the miseries brought on Palestine by the westward march of the Assyrian power, the idea of the sacrifice of one's own son, as the most powerful of atoning rites, should have taken hold of those kings ofJudah (Ahaz and Manasseh, 2 Kings xvi. 3, xxi. 6) who were otherwise prone, in their hopelessness of help from the old religion (Isa. vii. 12), to seek to strange peoples and their rites. Ahaz's sacrifice of his son (which indeed rests on a somewhat late authority) was apparently an isolated act of despair, since human sacrifices are not among the corruptions of the popular religion spoken of by Isaiah and Micah. In the 7th century, however, when the old worship had sustained rude shocks, and all religion was transformed into servile fear (Mic. vi. 1 seq.), the example of Manasseh did not stand alone, and Jeremiah and Ezekiel made frequent and indignant reference to the "high places" for the sacrifice of children by their parents and the "fire of the Children of Israel" in the very walls of the temple from the gloomy ravine of Hinnom to Tophet (Jer. vii. 31, xix., xxxii. 35; Ezek. xvi. 18 sqq., xxiii. 37). The children were not burned alive; they were slain and burned like any other holocaust (Ezek. loc. cit.; Isa. vii. 5), their blood was shed at the sanctuary (Jer. xix. 4; Ps. cxi. 38). Thus the late Rabbinical picture of the calf-headed image of Molech within which children were burned alive is pure fable, and with it falls the favourite comparison between Molech and the Carthaginian idol from whose brazen arms children were rolled into an abyss of fire, and whom Diodorus (xix. 14) naturally identifies with the child-eater Kronos, thus leading many moderns to transform Molech the planet Saturn.

It is with these sacrifices that the name of "the Molech" is always connected; sometimes "the Baal" (lord) appears as a synonym. At the same time, the horrid ritual was so closely associated with Yahweh worship (Ezek. xxiii. 39) that Jeremiah more than once finds it necessary to protest that it is not of Yahweh's institution (vii. 31, xix. 5). So too it is the idea of the sacrifice of the first-born to Yahweh that is discussed and rejected in Micah vi. It is indeed plain that wherever we have here to do, not with human victims in general, but with the sacrifice of the least earthly thing—could only be paid to the supreme deity; and Manasseh and his people never ceased to acknowledge Yahweh as the God of Israel. Thus the way in which Jeremiah (Jer. xix. 5) and the legislation of Leviticus (xvii. 21, xx. 2–5) and the author of Kings, seem to mark out the Molech or Baal as a false god, distinct from Yahweh, is precisely parallel to the way in which Hosea speaks of the golden calves or Baalim. In each case the people thought themselves to be worshipping Yahweh under the title of Molech or Baal; but the prophet refuses to admit that this is so, because the worship itself is an apostasy to heathenism. Note, also, the attitude of Ezekiel in xx. 25 seq., 31, references which cannot be explained away.

Although the motive came from within, the form taken by the cult has appeared to many to be of non-Israelite origin. Babylonia and Assyria, however, seem to be out of the question: molech, "arbiter, decider," there is an epithet of various gods, and as an appellative means "prince" and not king; further, little

4 In Hos. xiii. 2, the interpretation "they that sacrifice men" is impossible, and 2 Kings xvii. 17 and Lev. xix., xx. are of too late date by themselves to prove the immolation of children to Molech in old Israel. The "ban" (מַּכָּה), which was a religious execution of criminals or enemies, was common to Israel with its heathen neighbours (cf. the inscription of Mesha), but lacked the distinctive character of a sacrifice in which the victim is the food of the deity, conveyed to him through fire.

5 The etymology of the word Topheth is obscure; it is possibly of Aramaic origin and means "fire-place," cf. topheth, "pyre." (I.A.S. 33). The vocalization is artificial, the Masoretes having given it the vowel-points of bōsheth. See W. R. Smith, Religion of the Semites, 2nd ed., 377.
evidence for the prevalence of human sacrifice has as yet been
found in those lands (A. Jeremias, Das Altert. im Lichte d. alten
Orients, 2nd ed., p. 454). Among the Canaanite branch, the
king-god is more prominent, and apart from the Ammonite
variant Milcom, numerous names compounded with Milk-are
found on Phoenician inscriptions and among western Semites
mentioned in cuneiform literature (H. Zimmern, Keilinschr. u.
das Alter T., 3rd ed., pp. 470 sqq.). It is true that child-
sacrifice in connexion with fire prevailed among the Phoenicians,
and, according to the Greeks, the deity honoured with these
grisly rites was Kronos (identified with the Phoenician El,
"God"). On the other hand, the seat of the cult appears to
have been at Jerusalem, and the period during which it flourished
do not favours any strong Phoenician influence. Again, the
form of the word Tophet and Ahaz's association with Damascus
might point to an Aramaean origin for the cult; but it would not
be safe to support this view by the statements and names in
2 Kings xvii. 31. On the whole, the biblical tradition that the
Molech-cult was Canaanite and indigenous (Deut. xii. 29 sqq.,
viii. 9 seq.) holds the ground. There was a tendency in time of
misfortune to revert to earlier rites (which is illustrated in some
ancient surviving customs), and it may have been an old
dissolved practice revived under the pressure of national distress.

MOLFSHEM, a town of Germany, in the imperial province of
Alsace-Lorraine at the foot of the Voges, on the Breusch and
at the junction of railways to Zabern and Strassburg. Pop.
(1905), 3764. It contains a beautiful Roman Catholic and a
Protestant church, a handsome new town-hall and an agricultural
school. Its industries comprise the manufacture of iron and
steel goods, tanning and organ-building. There is also some
trade in agricultural produce. In the 19th century Molsheim, and formerly
was the seat of a famous Jesuit college, which in 1792 was removed to Strassburg and united with the
university of that city.

MOLTFKE, ADAM GOTTLOB, COUNT (1710-1792), Danish
courtier, was born on the 10th of November 1710, at Riesenhof
in Mecklenburg. Though of German origin, many of the
Moltkes were at this time in the Danish service, which was
considered a more important and promising opening for
the young north German noblemen than the service of any of the
native principalities; and through one of his uncles, young
Moltke became a page at the Danish court, in which capacity
he formed a life-long friendship with the crown prince Frederick,
afterwards Frederick V. He never had any opportunity of
enriching his mind by travel or study, but he was remarkable for
a strongly religious temperament and seems for some time to
have been connected with the Moravians. Immediately
after his accession Frederick V. (1745) raised Moltke to the rank of
general-advisor and marshal), and overwhelmed him with marks of favour, making
him a privy councillor and a count and bestowing upon him
Brescia and other estates. As the inseparable companion
of the king, Moltke's influence soon became so boundless that the foreign
diplomats declared he could make and unmake
ministers at will. Fortunately he was no ordinary favourite.
Naturally tactful and considerate, he never put difficulties in
the way of the responsible ministers. Especially interesting
is Moltke's attitude towards the two distinguished statesmen
who played the leading parts during the reign of Frederick V.,
Johan Sigismund Schulin and the elder Bernstorff. For Schulin
he had a sort of veneration. Bernstorff irritated him by his
grand airs of conscious superiority. But though a Prussian
intrigue was set up for the supersession of Bernstorff by Moltke,
the latter, convinced that Bernstorff was the right man in
the right place, supported him with unswerving loyalty. Moltke
was far less liberal in his views than many of his contemporaries.
He looked askance at all projects for the emancipation of the
serfs, but, as one of the largest landowners of Denmark, he did
much service to agriculture by lightening the burdens of the
countrymen and introducing technical and scientific improvements
which greatly increased production. In 1770, however,
was the guardianship he exercised over the king,
whose sensual temperament and weak character exposed him
to many temptations which might have been very injurious to
the state. Frederick had the good sense to appreciate
the honesty of his friend and there was never any serious breach
between them. On the death of Queen Louisa the king would
have even married one of Moltke's daughters had he not
peremptorily declined the dangerous honour. On the decease
of Frederick V., who died in his arms (Jan. 14, 1766), Moltke's
domination was at an end. The new king, Christian VII.,
could not endure him, and exclaimed, with reference to his lankly
figure: "He's stork below and fox above." He was also
extremely unpopuar, because he was wrongly suspected of
enriching himself at the public expense. In July 1766 he was
dismissed from all his offices and retired to his estate at Bresen.
Subsequently, through the interest of Russia, to whom he had always been favourable, he regained a seat in
the council (Feb. 8, 1768), but his influence was slight and of
brief duration. He was again dismissed without a pension, on
the 10th of December 1770, for refusing to have anything to
do with Struensee. He lived in retirement till his death on
the 25th of September 1792.

His memoirs, written in German and published in 1780, have
cconsiderable historical importance. See H. Langhorn, Historische
Nachricht über die dänischen Moltkes (Kiel, 1871). (R. N. B.)

MOLTFKE, ADAM WILHELM, COUNT (1785-1864), Danish
statesman, son of the minister Joachim Godske Moltke (1746-
1818), and grandson of Adam Gottlob Moltke, was born at
Einsiedelsborg in Funen, on the 25th of August 1785. Under
the influence of the agricultural reformer Christian Colbjörnsen
he abandoned the legal career he had adopted and entered
the administrative service of the state, to which he devoted
the remainder of his life. In 1831 he succeeded Johan Sigismund
Möste (1780-1843), as minister of finance. On the death of
Christian VIII. he was one of the most prominent members
of the Council of State, and when the constitutional crisis came
in 1848 he seemed marked out as the man who could bridge
over the gap between the old era and the new. The services
which Count Moltke rendered to Denmark cannot be too highly
appreciated. The mere fact that a distinguished statesman who had
served the last two absolute kings of Denmark now voluntarily
placed himself at the head of a ministry which included the
most advanced of the popular agitators, gave the new government
the hallmark of stability and trustworthiness, whilst
the fact that he still retained the ministry of finance was of
itself a guarantee of security during the earlier years of a troublesome and costly war. It was this, his first administration,
which introduced the constitution of the 5th of June 1849, and he also presided over the third constitutional ministry which was formed in February, he resigned on the 27th of January 1852, because he could not approve of the measures which aimed at transforming Denmark into a composite, indivisible,
monarchy. Moltke continued to take part in public life as a
member of the Landsting, or Upper House, but he forsook
himself in the background. On the 2nd of October 1855 he was elected
a member of the consultative Rigsråd, a position he continued
till 1863. He died on the 15th of February 1864.

See Swalin, Det danske Statsråd (Stockholm, 1881); Madvig,
Librerindreger (Copenhagen, 1887). (R. N. B.)

MOLTFKE, HELMUTH CARL BERNHARD, COUNT VON
(1800-1891), Prussian field marshal, for thirty years chief
of the staff of the Prussian army, the greatest strategist of the
latter half of the 19th century, and the creator of the modern
method of directing armies in the field, was born on the 26th
of October 1800, at Parchim in Mecklenburg, of a German family
of ancient nobility. His father in 1805 settled in Holstein and

1 He was said to be worth 10 million rix-dollars, but proved that
he had less than one million.
became a Danish subject, but about the same time was impoverished by the burning of his country house and the plunder by the French of his town house in Lübeck, where his wife and children were. Young Moltke therefore grew up in straitened circumstances. At the age of nine he was sent as a boarder to Hohenfelde in Holstein, and at the age of eleven to the cadet school at Copenhagen, being destined for the Danish army and court. In 1818 he became a page to the king of Denmark and second lieutenant in a Danish infantry regiment. But at twenty-one he resolved to enter the Prussian service, in spite of the loss of seniority. He passed the necessary examination with credit, and became second lieutenant in the 8th Infantry Regiment stationed at Frankfort-on-Oder. At twenty-three, after much less than the regulation term of service, he was allowed to enter the general war school, now the war academy, where he studied the full three years and passed in 1826 a brilliant final examination. He then for a year had charge of a cadet school at Frankfort-on-Oder, after which he was for three years employed on the military survey in Silesia and Posen. In 1832 he was seconded for service on the general staff at Berlin, to which he returned in 1833 on promotion to first lieutenancy. He had been transferred as a staff officer, and among them by Prince William, then a lieutenant-general, afterwards king and emperor. He was well received at court and in the best society of Berlin. His tastes inclined him to literature, to historical study and to travel. In 1827 he had published a short romance, The Two Friends. In 1831 it was followed by an essay entitled Holland and Belgium in their Mutual Relations, from their Separation under Philip II. to their Reunion under William I., in which were displayed the author's interest in the political issues of the day, and his extensive historical reading. In 1832 appeared An Account of the Internal Circumstances and Social Conditions of Poland, a second study of a burning question based both on reading and on personal observation of Polish life and character. In 1832 he contracted to translate Gibbon's Decline and Fall into German, for which he was to receive £75, his object being to earn the money to buy a horse. In eighteen months he had finished nine volumes out of twelve, but the publisher who had produced the book and Moltke never received more than £25, so that the chief reward of his labour was the historical knowledge which he acquired. He had already found opportunities to travel in south Germany and northern Italy, and in 1835 on his promotion as captain he obtained six months' leave to travel in south-eastern Europe. After a short stay in Constantinople he was requested by the sultan to enter the Turkish service, and being duly authorized from Berlin he accepted the offer. He remained two years at Constantinople, learned Turkish and surveyed for the sultan the city of Constantinople, the Bosporus and the Dardanelles. He travelled in the sultan's retinue through Bulgaria and Rumelia, and made many other journeys on both sides of the Strait. In 1838 he was sent as adviser to the Turkish general commanding the troops in Armenia, who was to carry on a campaign against Mehmet Ali of Egypt. During the summer he made extensive reconnaissances and surveys, riding several thousand miles in the course of his journeys, navigating the dangerous Euphrates, and visiting and mapping many districts where no European traveller had preceded him since Xenophon. In 1839 the army moved south to meet the Egyptians, but upon the approach of the enemy the general became more attentive to the prophecies of the mollahs than to the advice of the Prussian captain. Moltke resigned his post of staff officer and took charge of the artillery, which therefore, in the ensuing battle of Neseb or Nisib, was the last portion of the Turkish army to run away. The Turks were well beaten and their army dispersed to the four winds. Moltke with infinite hardship made his way back to the Black Sea, and thence to Constantinople. His patron Sultan Mahmoud was dead, so he returned to Berlin where he arrived, broken in health, in December 1839. When he left Berlin in 1834 he had already "the courtier's, soldier's, scholar's eye, tongue, sword." When he returned it was with a mind expanded by a rare experience, and with a character doubly tempered and annealed. While away, he had been a constant letter-writer to his mother and sisters, and he now revised and published his letters as Letters on Conditions and Events in Turkey in the Years 1835 to 1839. No other book gives so deep an insight into the character of the Turkish Empire, and no other book of travels better deserves to be regarded as a German classic. One of his sisters had married an English widower named Burt, who had settled in Holstein. Her stepdaughter, Mary Burt, had read the traveller's letters, and when he came home as a wooer was quickly won. The marriage took place in 1841, when Mary was just turned sixteen. It was a very happy union, though there were no children, and Moltke's love-letters and letters to his wife are among the most valuable materials for his biography. On his return in 1840 Moltke had been appointed to the staff of the 4th army corps, stationed at Berlin; he was promoted major on his wedding day. The fruits of his Eastern travels were by no means exhausted. He published his maps of Constantinople, of the Bosporus and of the Dardanelles, and, jointly with other German travellers, a new map of the Black Sea and the Crimea, and a memoir on the geography of that country, as well as a number of periodical essays on various factors in the Eastern Question. In 1845 appeared The Russo-Turkish Campaign in Europe, 1828-29, described in 1845 by Baron von Moltke, Major in the Prussian Staff, a volume which was recognized by competent judges as a masterpiece of military history and criticism. Moltke at this period was much occupied with the development of railways. He was one of the first directors of the Hamburg-Berlin railway, and in 1843 published a review article entitled What Considerations should determine the Choice of the Course of Railways which reveals a mastery of the technical questions involved in the construction and working of railway lines.

In 1845 Moltke was appointed personal adjutant to Prince Henry of Prussia, a Roman Catholic who lived at Rome. He thus had the opportunity of a long stay in the Eternal City, with no more than nominal duties to perform. It was a life which he and his wife much enjoyed, and he spent much of his leisure in a survey, of which the result was a splendid map of Rome, published at Berlin in 1852. In 1846 Prince Henry died, and Moltke was then appointed to the staff of the 8th army corps at Coblenz. In 1848, after a brief return to the general staff at Berlin, he became chief of the staff of the 4th army corps, of which the headquarters were then at Magdeburg, where he remained seven years, during which he rose to lieutenant-colonel (1850), and colonel (1857). In 1855 he was appointed first adjutant to Prince Frederick William (afterwards crown prince and emperor), whom he accompanied to England on his betrothal and marriage, as well as to Paris and to St Petersburg to the coronation of Alexander II. of Russia. Prince Frederick William was in command of a regiment stationed at Breslau, and there as his adjutant Moltke remained for a year, becoming major-general in 1856. On the 23rd of October 1857, owing to the serious illness of King Frederick William IV., Prince William became prince regent. Six days later the regent selected Moltke for the then vacant post of chief of the general staff of the army. The appointment was made definitive in January 1858. Moltke's posthumously published military works disclose a remarkable activity, beginning in 1857, devoted to the adaptation of strategical and tactical methods to changes in armament and in means of communication, to the training of staff officers in accordance with the methods thus worked out, to the perfection of the arrangements for the mobilization of the army, and to the study of European politics in connexion with the plans for campaigns which might become necessary. In 1859 came the war in Italy, which occasioned the mobilization of the Prussian army, and as a consequence the reorganization of that army, by which its numerical strength was nearly doubled. The reorganization was the work not of Moltke but of the king, and of Roon, minister of war; but Moltke watched the Italian campaign closely, and wrote a history of it, published in 1862, and attributed on the title-page to the historical division of the Prussian
staff, which is the clearest account of the campaign and contains the best criticism upon it. In December 1862 Moltke was asked for an opinion upon the military aspect of the quarrel with Denmark then becoming acute. He thought the difficulty would be to bring the war to an end, as the Danish army would if possible retire to the islands, where, as the Danes had the command of the sea, it could not be attacked. He sketched a plan for turning the flank of the Danish army before the attack upon its position in front of Schleswig, and hoped that by this means its retreat might be intercepted. When the war began in February 1864, Moltke was not sent with the Prussian forces, but kept at Berlin. The plan was mismanaged in the execution, and the Danish army escaped to the fortresses of Düppel and Fredericia, each of which commanded a retreat across a strait on to an island. The allies were now checked; Düppel and Fredericia were besieged by them, Düppel taken by storm, and Fredericia abandoned by the Danes without assault; but the war showed no signs of ending, as the Danish army was safe in the islands of Alsen and Fünen. On the 30th of April Moltke was sent to be chief of the staff to the commander-in-chief of the allied forces, and, so soon as the armistice of May and June was over, persuaded Prince Frederick Charles to attempt to force the passage of the Sundewitt and attack the Danes in the island of Alsen. The landing was attempted on the 29th from the commander-in-chief, and Moltke next proposed a landing in Fünen, but it was unnecessary. The Danes no longer felt safe in their islands, and agreed to the German terms. Moltke's appearance on the scene had quickly transformed the aspect of the war, and his influence with the king had thus acquired a firm basis. Accordingly, when in 1866 the quarrel with Austria came to a head, Moltke's plans were adopted and he was almost invariably supported in their execution. A disciple rather of Clausewitz, whose theory of war was an effort to grasp its conditions, than of Jomini, who expounded a system of rules, Moltke regarded strategy as a practical art of adapting means to ends, and had developed the methods of Napoleon in accordance with the altered conditions. He had been the first to realize the great defensive power of modern firearms, and had inferred from it that an enveloping attack had become more formidable than the attempt to pierce an enemy's front. He had pondered the tactics of Napoleon at Bautzen, when the emperor preferred to bring up Ney's corps, coming from a distance, against the flank of the allies, rather than to unite it with his own forces before the battle; he had also drawn a moral from the contrary action of the allies at Waterloo. At the same time he had worked out the conditions of the march and supply of an army. Only one army corps could be moved along one road in the same day; to put two or three corps on the same road meant that the rear corps could not be made use of in a battle at the front. Several corps stationed close together in a small area could not be fed for more than a day or two. Accordingly he inferred that the essence of strategy lay in arrangements for the separation of the corps for marching and their concentration in time for battle. In order to make a large army manageable, it must be broken up into separate armies or groups of corps, each group under a commander authorized to regulate its movements and action subject to the instructions of the commander-in-chief as regards the direction and purpose of its operations. In the strategy of 1866 the conspicuous points are: (1) The concentration of effort. There were two groups of enemies, the Austro-Saxon armies, 270,000; and the north and south German armies, 120,000. The Prussian forces were 64,000 short of the adverse total, but Moltke determined to be superior to the decisive point against the Austro-Saxons; he therefore told off 270,000 men for that portion of the struggle, and employed only 48,000 men in Germany proper. His brilliant direction enabled the 48,000 to capture the Hanoverian army in less than a fortnight, and then to attack and drive asunder the south German forces. (2) In dealing with Austro-Saxony the difficulty was to have the Prussian army first reach —no easy matter, as the king would not mobilize until after the Austrians. Moltke's railway knowledge helped him to save time. Five lines of railway led from the various Prussian provinces to a series of points on the southern frontier on the curved line Zeitz-Halle-Görlitz-Schweidnitz. By employing all these railways at once, Moltke had the several army corps moved simultaneously from their peace quarters to points on this curved line. When this first move was finished the corps then marched along the curve to collect into three groups, one near Torgau (Elbe army), another at the west end of Silesia (first army, Prince Frederick Charles), the third between Landsbut and Waldenburg (second army, crown prince). The first army when formed marched eastwards towards Görlitz. The small Saxon army at Dresden now had the Elbe army in its front and the first army on its right flank, and as it was outnumbered by either of them, its position was untenable, and so soon as hostilities began fell back into Bohemia, where it was joined by an Austrian corps, with which it formed an advance guard far in front of the Austrian main army concentrated near Olmitz. The Elbe army advanced to Dresden, left a garrison there, and moved to the right of Prince Frederick Charles, under whose command it now came. (3) Moltke now had two armies about 100 miles apart. The problem was how to bring them together so as to catch the Austrian army between them like the French at Waterloo between Wellington and Blücher. If, as was thought likely, the Austrians moved upon Breslau, the Saxon army at Dresden, and the corps at Altenburg would co-operate with the second. But on the 15th of June Moltke learned that on the 11th of June the Austrian army had been spread out over the country between Wildenschwerdt, Olmitz and Brünn. He inferred that it could not be concentrated at Josefstadt in less than thirteen days. Accordingly he determined to bring his own two armies together by directing each of them to advance towards Gitschin. He foresaw that the march of the crown prince would probably bring him into collision with a portion of the Austrian army; but the crown prince had 100,000 men, and it was not likely that the Austrians could have a stronger force than that within reach of him. The order to advance upon Gitschin was issued on the 22nd of June, and led to one of the greatest victories on record. The Austrians marched faster than Moltke expected, and might have opposed the crown prince with four or five corps; but Benedek's attention was centred on Prince Frederick Charles, and he interposed against the crown prince's advance four corps not under a common command, so that they were beaten in detail, were scattered, and the Austrians with 120,000 against 270,000 were discomfited. Moltke collected his already shaken forces in a defensive position in front of Königgrätz. Moltke's two armies were now within a march of one another and of the enemy. On the 3rd of July they were brought into action, the first against the Austrian front and the second against the Austrian right flank. The Austrian army was completely defeated and the campaign decided, though an advance towards Vienna was needed to bring about the peace upon Prussia's terms. Moltke was not quite satisfied with the battle of Königgrätz. He had tried to have the Elbe army brought up to the Elbe above Königgrätz so as to prevent the Austrian retreat, but its general failed to accomplish this. He also tried to prevent the first army from pushing its attack, hoping in that way to keep the Austrians in their position until retreat should be cut off by the crown prince, but he could not restrain the impetuosity of Prince Frederick Charles and of the king. During the negotiations Bismarck, who dared not risk the active intervention of France, opposed the king's wish to annex Saxony and perhaps other territory beyond what was actually taken. Moltke would not have hesitated; he was confident of beating both French and Austrians if the French should intervene, and he submitted to Bismarck his plans in case of need for the opening moves against both French and Austrians.

After the peace, the Prussian Diet voted Moltke the sum of £30,000, with which he bought the estate of Kreisau, near Schweidnitz, in Silesia. In 1867 was published The Campaign of 1866 in Germany, a history produced under Moltke's personal
MOLTKE

supervision, and remarkable for its combination of accuracy with reticence. On the 24th of December 1868 Moltke's wife died at Berlin. Her remains were buried in a small chapel erected by Moltke as a mausoleum in the park at Creisau.

In 1870 suddenly came the war with France. The probability of such a war had occupied Moltke's attention almost continuously since 1857, and a series of memoirs is preserved in which from time to time he worked out and recorded his ideas as to the best arrangement of the Prussian or German forces for the opening of the campaign. The arrangements for the transport of the army by railway were annually revised in order to suit the changes in his plans brought about by political conditions and by the growth of the army, as well as by the improvement of the Prussian system of railways. The great successes of 1866 had strengthened Moltke's position, so that when on the 15th of July 1870 the order for the mobilization of the Prussian and south German forces was issued, his plans were adopted without dispute and five days later he was appointed "Chief of the general staff of the army at the headquarters of his Majesty the King" for the duration of the war. This gave Moltke the right to issue in the king's name, though of course not without his approval, orders which were equivalent to royal commands. Moltke's plan was to assemble the whole army in the north of Germany. The army was divided into three portions, in which an army could best secure the defence of the whole frontier. If the French should disregard the neutrality of Belgium and Luxemburg, and advance on the line from Paris to Cologne or any other point on the Lower Rhine, the German army would be able to strike at their flank, while the Rhine itself, with the fortresses of Coblenz, Cologne and Wesel, would be a serious obstacle in their front. If the French should attempt to invade south Germany, an advance of the Germans up either bank of the Rhine would threaten their communications. Moltke expected that the French would be compelled by the direction of their railways to collect the greater part of their army near Metz, and a smaller portion near Strassburg. The German forces were grouped into three armies: the first of 60,000 men, under Steinmetz, on the Moselle below Trèves; the second of 131,000 men, under Prince Frederick Charles, round Homburg, with a reserve of 60,000 men behind it; the third under the crown prince of 130,000 men, at Landau. Three army corps amounting to 100,000 men were not reckoned upon in the first instance, as it was desirable to keep a considerable force in north-eastern Germany, in case Austria should take part in a common cause with France. If, as seemed probable, the French should take the initiative before the German armies were ready, and for that purpose should advance from Metz in the direction of Mainz, Moltke would merely put back a few miles nearer to Mainz the points of debarkation from the railway of the troops of the second army. This measure was actually adopted, though the anticipated French invasion did not take place. Moltke's plan of operations was that the three armies while advancing should make a right wheel, so that the first army on the right would reach the bank of the Moselle opposite Metz, while the second and third armies should push forward, the third army to defeat the French force near Strassburg, and the second to strike the Moselle near Pont-à-Mousson. If the French army should be found during this advance in front of the second army, it would be attacked in front by the second army and in flank by the first or the third or both. If it should be found on or north of the line from Saarburg to Lunéville, it could still be attacked from two sides by the second and third armies. The objection of the right wheel was to attack the principal French army in such a way as to drive it north and cut its communications with Paris. The fortress of Metz was to be observed, and the main German forces, after defeating the chief French army, to march upon Paris. This plan was carried out in its broad outlines. The battle of Wörth was brought on prematurely, and therefore led, not to the capture of MacMahon's army, which was intended, but only to its total defeat and hasty retreat as far as Châlons. The battle of Spichern was not intended by Moltke, who wished to keep Bazaine's army on the Saar till he could attack it with the second army in front and the first army on its left flank, while the third army was closing towards its rear. But these unintended or unexpected victories did not disconcert Moltke, who, carried out his intended advance to Pont-à-Mousson, there crossed the Moselle with the first and second armies, then faced north and wheeled round, so that the effect of the battle of Gravelotte was to drive Bazaine into the fortress of Metz and cut him off from Paris. Nothing shows Moltke's insight and strength of purpose in a clearer light than his determination to attack on the 18th of August, when many strategists would have thought that, the strategical victory having been gained, a tactical victory was unnecessary. He has been blamed for the last local attack at Gravelotte, in which there was a fruitless heavy loss; but it is now known that this attack was ordered by the king, and Moltke blamed himself for not having used his influence to prevent it. During the night following the battle Moltke made his next decision. He left one army to invest Bazaine and Metz, and set out with the two others to march towards Paris, the more southerly one leading, so that when MacMahon's army should be found the main blow might be delivered from the south and MacMahon driven to the north. On the 23rd of August it was found that MacMahon was moving north. Moltke, according to his plans, should have been at Moulins satisfied of the accuracy of his information, he ordered the German columns to turn their faces north instead of west. MacMahon's right wing was attacked at Beaumont while attempting to cross the Meuse, his advance necessarily abandoned, and his army with difficulty collected at Sedan. Here the two German armies were so brought up as completely to surround the French army, which on the 1st of September was attacked and compelled to raise the white flag. After the capitulation of Sedan, Moltke resumed the advance on Paris, which was surrounded and invested. From this time his strategy is remarkable for its judicious economy of force, for he was wise enough never to attempt more than was practicable with the means at his disposal. The surrender of Metz and of Paris was a question of time, and the problem was, while maintaining the investment, to be able to ward off the attacks of the new French armies levied for the purpose of raising the siege of Paris. Metz surrendered on the 27th of October, and on the 28th of January 1871 an armistice was concluded at Paris by which the garrison became virtually prisoners and the war was never at a loss.

On the 29th of October 1870 Moltke was created graf (count) of earl, and on the 16th of June 1871, field marshal. After the war he superintended the preparation of its history, which was published between 1874 and 1881 by the great general staff. In 1888 he resigned his post as chief of the staff. In 1867 Moltke was elected to the North German Diet, and in 1871 to the Reichstag. His speeches, dealing mostly with military questions, were regarded as models of conciseness and relevancy. He died suddenly on the 24th of April 1891, and after a magnificent funeral ceremony at Berlin his remains were laid beside those of his wife in the chapel which he had erected as her tomb at Creisau.

As a strategist Moltke cannot be estimated by comparison with Frederick or Napoleon, because he had not the authority either of a king or of a commander-in-chief. While it is doubtful whether he can be convicted of any strategical errors, it seems beyond doubt that he never had to face a situation which placed any strain on his powers, for in the campaigns of 1866 and 1870 his decisions seemed to be made without the slightest effort, and his success was never at a loss.

He had a tall spare figure, and in his latter years his tanned features had received a set expression which was at once hard and grand. He was habitually taciturn and reserved, though a most accomplished linguist, so that it was said of him that he was "silent in seven languages." The stern school of his early life had given him a rare self-control, so that no indiscreet or unkind expression is known to have ever fallen from him. Long before his name was on the lips of the public he was known...
in the army and in the staff as the "man of gold," the ideal character whom every one admired and who had no enemies.

The name Moluccas is said to be derived from the Arabic for "spice," 'Al-κε,.. The first mention of the islands is found in the "Grote Oost," where they are described as "The Moluccas proper or Ternate group, which Halmahera is the largest and Ternate the capital; (2) the Bachlan, Obi, and Xulla groups; (3) the Amboyna group, of which Ceram (Serang) and Buru are the largest; (4) the Banda Islands (the spice or nutmeg islands par excellence); (5) the south-eastern islands, comprising Timor-Laut or Tenimber, Larat, &c.; (6) the Kei Islands and the Aru Islands, of which the former are sometimes attached to the south-eastern group; and (7) the south-western islands or the Babar, Sermata, Leti, Damar, Roma and Wetar groups. At the close of the 16th century this part of the archipelago was divided among four rulers settled at Ternate, Tidore, Halmahera and Bachlan. The northern portion belongs to the Dutch residency of Ternate, the southern portion to that of Amboyna.

The geology of the Moluccas is very imperfectly known. The granites of Halmahera and Sumatra are rich in wulfenite, which runs continued eastwards into the Moluccas, and terminates in a hook-like curve which passes through the Damar Islands to the Banda group. Outside this hook lies a concentric arc of volcanic islands, including Tenimber, the Lesser Kei Islands, Ceram and Buru; and beyond is still a third concentric arc extending from Talaibau to the Greater Kei Islands. The islands of these outer arcs consist chiefly of crystalline schists and limestones, overlaid by the Jurassic, Cretaceous and Tertiary deposits. On the whole it appears that the older rocks are found more particularly towards the interior of the curve, and the newer rocks towards the exterior. Eruptive rocks of supposed Cretaceous age are met with in these outer islands, but Tertiary and recent volcanic lavas are confined to the inner islands. These lavas are of two kinds: (1) those which consist chiefly of gabbro, peridotite, serpentine and other very basic eruptive rocks, which are believed to be of Cretaceous age. Nummulitic limestone occurs in the south-east. Upon the floor of older rock rise a number of volcanoes, some of which are now extinct while others are of recent date. These are composed chiefly of wülfenite, Molybdenum (MoS₂), and occasionally of galena; and they are arranged in lines which run approximately from north to south, with, generally, a slight convexity towards the west.

See further "Molucca Archipelago," and separate articles on the principal islands and groups.

MOLY (Gr. μολυ), a mysterious plant with magical powers described in Homer, Odyssey, x. 303-306. Hermes pulls it up, and gives it to Odysseus as a protection against the arts of Circe. It is further described as "having a black root and a flower like milk, and hard for mortals to pull up." There has been much controversy as to the identification. Philippe Champault—Phéniciens et Grecs en Italie d'après l'Odyssée (1906), pp. 504 seq.—decides in favour of the Peganum harmala (of the order Rutaceae), the Syrian or African rue (Gr. πτεράγων), from the husks of which the vegetable alkaloid harmaline (C₁₉H₂₆N₂O) is extracted. The flowers are white with green stamens. Victor Bérend—Les Phéniciens et l'Odyssée, ii. 288 seq.—relying partly on a Semitic root, prefers the Artíplex halimus (atriplex, a Lat. form of Gr. ἀρτίπλεξ, and δίους, marine), order Chenopodiaceae, a herb or low shrub common on the south European coasts. These identifications are contested by R. M. Henry in Class. Res. (Dec. 1906), p. 434, who illustrates the Homerian account by passages in the Paris and Leiden magical papyri, and argues that moly is probably a magical name, derived perhaps from Phoenician or Egyptian sources, for a plant which cannot be certainly identified. He shows that the "difficulty of pulling up" the plant is not a merely physical one, but rather connected with the peculiar powers claimed by magicians. In Tennyson's Lotus Eaters the moly is coupled with the amaranth ("propt on beds of amaranth and moly").

MOLYBDENITE, a mineral consisting of molybdenum disulphide, MoS₂. It closely resembles graphite in appearance, but may readily be distinguished from this by its greater density (4.7) and by its behaviour before the blowpipe. Crystals have the form of six-sided plates or scales, but they are never sharply defined, and their extension to the hexagonal system is doubtful. They have a perfect cleavage parallel to the large face of the plate, and the flakes are readily bent, but are not elastic. The mineral is very soft (H = 1 to 2) and unctuous, and makes a bluish-grey mark on paper: it is opaque and has a bright metallic lustre. The colour is lead-grey differing slightly from that of graphite in having a bluish tinge. The name molybdenite is from the Greek μολύβδος, meaning lead or lead ore, with which graphite (black-lead) and molybdenite were confused; the latter was distinguished by P. J. Hjelm, who in 1782 discovered the element molybdenum in this mineral.

Molybdenite occurs as disseminated scales in crystalline rocks—such as granite, gneiss, schist and marble—and also in quartz-veins. It has been found in small amounts at many localities, but only those which have yielded large crystals need be specially mentioned here, viz. in a pyroxene-rock at Aldfield in Pontiac county, Quebec; with native bismuth at Kingsgate in Gough county, New South Wales; with wolframite and scheelite in quartz-veins at Caldecott Fells in Cumberland; and recently, as crystals 6 in. across, at Slievegeord near Raade in Norwegi.
latter case with the formation of a blue solution which on heating becomes colourless, molybdenum trioxide being formed with the liberation of sulphur dioxide.

Molybdenum combines with oxygen to form many oxides, the most important of which are: the monoxide, MoO (H₂O), the sesquioxide, MoO₂, the dioxide, MoO₃, and the trioxide, MoO₃. Molybdenum molybdate, a potassium salt of molybdenum acid, is obtained by heating molybdenum dichloride is boiled with concentrated potash solution. According to W. Muthmann and W. Nagel (Ber., 1898, 31, p. 209), this oxide does not exist, the reaction leading to the formation of an hydroxide according to the equation: 4MoO₃ + 3H₂O = 4Mo(OH)₃ + 3O₂. Molybdenum sesquioxide, MoO₃, a black mass insoluble in acids, is formed by heating the corresponding hydroxide in vacuo, or by digesting the trioxide with zinc and hydrochloric acid. The compound is formed when the white, almost insoluble molybdenum tribromide, Na₂MoBr₃, is reduced in a current of hydrogen (L. Svanberg and H. Struve, Jour. prak. Chem., 1848, 34, p. 301), or by long fusion of a mixture of ammonium molybdate, potassium carbonate, and phosphorus pentoxide (W. Muthmann, Ann., 1885, 238, p. 114). It forms quadrangular prisms, having a violet reflex and insoluble in boiling hydrochloric acid. Molybdenum trioxide, MoO₃, is prepared by oxidizing the metal or the sulphide by heating them in air, or with nitric acid. It is a white powder, which turns pale yellow on heating, and melts at a red heat. It sublimes in small rhombic tables or needles, and is slightly soluble in cold water, the solution possessing an acid reaction. Several hydrated forms of the oxide are known, and are to be obtained from dilute solutions in the hydrochloric acid solution of sodium molybdate. Molybdenum trioxide, like chromium trioxide, is an acidic oxide, and forms salts known as molybdates. The normal molybdates show a tendency to form double compounds (like those of the other oxides) on the introduction of combining with other oxides (such as phosphorus and arsenic pentoxides) yielding very complex salts. The ordinary ammonium molybdate, used as a test reagent for phosphates, is a salt of considerable interest, for it provides the first example of a true (NH₄)₂MO₃, prepared specially by J. Sand and F. Eisenlohr (Abst. J.C.S., 1906, ii, pp. 178, 179). The molybdates may be recognized by the fact that they give a white precipitate on the addition of hydrochloric or nitric acid, and that when reduced with zinc and sulphuric acid they give generally a blue coloration which turns to a green and finally to a brown colour.

Molybdenum combines with the halogen elements in varying proportions, forming with chlorine a di-, tri-, tetra- and penta-chloride, and with bromine the dibromide, dibromide, and dibromide. dichloride (MoCl₅), or Cl₂MoCl₃ (chloromolybdenum chloride), is prepared (together with some tetrachloride) by heating the trioxide in an atmosphere of chlorine. The compound is unstable and susceptible of combining with other oxides (such as phosphorus and arsenic pentoxides) yielding very complex salts. The ordinary ammonium molybdate, used as a test reagent for phosphates, is a salt of considerable interest, for it provides the first example of a true (NH₄)₂MO₃, prepared specially by J. Sand and F. settled in the highlands of the protectorate, and by means of the railway to Victoria Nyanza taps the rich regions of the Nile sources. German, British, French and Austrian mail-boats call regularly at the port, which is connected by submarine cable with Zanzibar. Trade statistics are included in those of British East Africa (q.v.).

Mombasa Island (named after the town) is 3 m. long by 2½ m. broad, with an area of 9 sq. m. Except at the western end, the coast of the island consists of cliffs from 40 ft. to 60 ft. high. The island contains many fertile plantations, chiefly of coco-nut palms, except on the side facing the ocean, where there is little vegetation, the coral reefs being thin and covered with earth. There are no springs and the island is dependent for water on rain collected in tanks or drawn from wells—the latter brackish. Ruins of Arab, Portuguese and Turkish buildings are found in various parts of the island. At Ras Serani are the ruins of a chapel “Nossa Senhora das Mercês,” built by the Portuguese in the 17th century on the site of a Turkish fort, and afterwards turned into a fort again by the Arabs.

Mombasa takes its name from Mombasa in Oman. A Perso-Arabic settlement was made here about the 11th century. It is mentioned by Ibn Batuta in 1327 as a large place, and at the time of Vasco da Gama’s visit (1498) it was the seat of considerable commerce, its inhabitants including a number of Calicut Banyans and Oriental Christians. The ruler of the city tried to entrap da Gama (or so the Portuguese navigator imagined), and with this began a series of campaigns which gave full force to its Swahili name *Mvita* (war). The principal incidents are the capture and burning of the place by Almeida (1505), Nuno da Cunha (1529), and Duarte de Menezes (1587)—this last as a revenge for its submission to the sultan of Constantinople—the revolt and flight (1631) of Yusuf ibn Ahmed (who murdered all the Portuguese in the town—over 100), and the three-years’ siege by the imam of Oman 1656–58 (the garrison being reduced to eleven men and two women), ending in the expulsion of the Portuguese. From the 12th of March 1728 to the 29th of November 1729 a Portuguese force from Goa again held Mombasa, when they were finally driven out by the Maccut Arabs. In December 1823 the Mazrui family, who had ruled in Mombasa from the early part of the 18th century, first as representatives of Oman, afterwards as practically independent princes, placed the city under British protection; and in February 1824 Lieut. J. J. Reitz was appointed commandant or resident at the city by Captain (afterwards Vice-Admiral) W. F. W. Owen. Reitz, after whom Port Reitz is named, died at Mombasa either in 1824 or 1825. The protectorate was repudiated by the British government, which left the place to be bombarded and captured by Seyyid Said of Oman, who made repeated attacks between 1829 and 1833, and only got possession in 1837 by treachery. Said thereafter made Zanzibar his capital, Mombasa becoming of secondary importance. A revolt against Zanzibar in 1875 was put down with British assistance. The British government in the following year vetoed a proposal by the khedive Ismail to annex Mombasa and its hinterland up to the equatorial lakes to Egypt—a project which originated with General C. H. Gordon, who had administered the Upper Nile province. In 1887 the city was handed over by the sultan of Zanzibar to the British for administration. It became the capital of the province of Seyyidie and of the East Africa protectorate. In 1907, however, the seat of the central government was removed to Nairobi (q.v.). Mombasa still forms, nominally, part of the sultanate of Zanzibar. The city, together with Malindi, is mentioned in *Paradise Lost*.

**Momein**—MOMMSEN

The Burmese name of the Chinese city Téng-yüeh-chow, in the S.W. of the province of Yunnan, China. It was opened to foreign trade by the Burmese Convention of 1859, but so far no advantage has been taken of the permission. It lies close to the Burmese frontier and on the old trade route from Bhamo to Yunnan, but its importance as an outpost of the British Empire is political rather than commercial. The distance from Téng-yüeh to Bhamo by the usual trade route is 160 m., and is generally traversed by pack-animals in seven or eight days. In a straight line the two towns are only 80 m. apart. Near Momein and within its jurisdiction is the frontier town of Manwyne, where A. R. Margary was assassinated in January 1875.

**Mommesen, Theodor** (1817–1903), German historian and archaeologist, was born on the 30th of November 1817 at Garding, in Schleswig. After being educated at the university of Kiel he devoted himself to the study of Roman law and antiquities. In 1843 a grant from the Danish government enabled him to undertake a journey to Italy, which was to be decisive for his future career. There he began the study of Roman inscriptions, in association with other Italian and German scholars, especially Borghezi, de Rossi and Henzen. His first work was directed to the restoration of the old Italian dialects, and the French government, which at one time proposed to undertake the task of compiling a complete collection of all extant Roman inscriptions, asked for his co-operation. When they gave up the project it was taken up by the Berlin Academy, which had recently completed the collection of Greek inscriptions edited by Boeckh. They had already made a grant to Mommesen, and in 1844 he was proposed that he should be appointed to carry out the great work. Many years, however, passed before the plan was finally approved. Meanwhile Mommesen continued his work in Italy: he drew up a full memorandum explaining the principles on which a *Corpus inscriptionum* should be compiled, and on which alone he could undertake the editorship. As a specimen he collected the inscriptions of Samnium, and in 1852 published those of the kingdom of Naples. These works caused him to be recognized as the first authority in this field of learning. In 1847, however, he was obliged to return to Germany: he first went to Schleswig, where during the Revolution he edited a paper in which he supported the claims of the Elbe Duchies; at the end of 1848 he was appointed professor of civil law at Leipzig. His work there was interrupted by his political opinions. During 1848, when the extreme party was in the ascendant, Mommesen supported the monarchy against the Republicans. With characteristic courage and independence, next year, when the Revolution had spent its force and Beutel executed his *coup d’état*, he protested, with many of his colleagues, against this act. In consequence he was summoned before a disciplinary court, and, together with Haupt and Jahn, dismissed from his professorship.

Mommesen found an asylum in Switzerland, and became professor at Zurich: he repaid the hospitality of the Republic by writing exhaustive monographs on Roman Switzerland. His spare time was occupied with the *Roman History*, the three volumes of which appeared between 1854 and 1860. His name at once became known throughout Europe. In this work, with a true insight into the relative importance of things, he passed over with a few strong broad strokes the antiquarian discussions on the origins of the city, on which previous historians had laboured so long; but in place of this he painted with astonishing vigour the great political struggle that accompanied the fall of the republic. It was, above all, his new reading of old characters which demanded attention; if not always approval: Cicero, the favourite of men of letters, was for him “a journalist in the worst sense of the word”; Pompey, the hero of Plutarch and the Moralists, was brushed aside as a mere drill-sergeant; and the book culminated in the picture of Caesar, who established absolute rule in the name of democracy, “the complete and perfect man.”

The three volumes ended with the dictatorship of Caesar. The book has never been continued, for the volume on the *Roman Provinces under the Empire*, which appeared in 1884, is in reality a separate work. Mommesen was henceforward fully occupied with work of a more technical nature. In 1884 the definitive offer was made to him by the Academy that he should be chief editor of a *Corpus inscriptionum*, with full control, and in order that he might carry on the work he was appointed in 1858 to a professorship at Berlin. The first volume appeared in 1861; five of the succeeding volumes he edited himself, and the
MOMORDICA—MONACO

whole was executed under his immediate supervision and with the co-operation of scholars whom he had himself trained.

Energetic as was the labour, this task occupied only a small part of his extraordinary intellectual energy. He found time to write two larger works, the History of the Roman Coinage and the Römische Staatsrecht, a profound analysis of Roman constitutional law, and Römisches Strafrecht, on Roman criminal jurisdiction. His Roman Provinces already mentioned gives a singularly picturesque picture of certain aspects of social life under the empire. His smaller papers amount to many hundreds in number, and there is no department of Roman life and learning, from the earliest records of the Roman law to the time of Jornandes, which he has not illuminated. As secretary to the Berlin Academy for over twenty years he took a leading part in their deliberations, and was their spokesman on great occasions.

His interest in political problems of the present was as keen as in those of the past. He was one of the founders of the Preussische Jahrbücher, the most influential of German political periodicals. For many years he was a member of the Prussian Parliament. His political opinions were strong but ill-regulated. Intensely nationalistic, he acquiesced in the annexation of his native land to Prussia, and in a public letter to the Italian nation in 1870 defended Mommsen's cause because the nation which had been his a second fatherland; but he was too independent a character ever to be quite at ease under Prussian government.

Loving liberty, he hated its consequences; a democrat, he had and always expressed a profound contempt for the mob. Like many idealists, he was a severe critic of the faults of his own and other countries, and he added something to the increasing Chauvinism in Germany.

It was, however, above all, German scholarship which remained his first interest. There is probably no other instance in the history of scholarship in which one man has established so complete an ascendancy in a great department of learning. Equally great as antiquary, jurist, political and social historian, he lived to see the time when among students of Roman history he had pupils, followers, critics, but no rivals. He combined the power of patient and minute investigation with a singular faculty for bold generalization and the capacity for tracing out the effects of thoughts and ideas on political and social life. Parity, perhaps, owing to a philosophical and literary bent, he was more and more in the mood and simple narrative, and he is more successful in describing the connexion between events than in describing the events themselves. Though his History ends with the fall of the republic, his most enduring work has been that on the empire; and if he has not written the history of the empire, he has made it possible for others to do so.

Mommsen died at Charlottenburg on the 1st of November 1903. His brothers, Carl Johann Tycho (1819–1900), a great authority on Pindar and Shakespeare, and August (b. 1821), who wrote chiefly on ancient chronology and Greek festivals, were also prominent among German scholars in their day.

The History of Rome (including the volumes of the provinces) has been translated into English by W. P. Dickson (the Provinces, revised by F. Haverfield, 1903); there is a French edition of his work on Rome itself (1887). Many of his pamphlets and articles have been collected under the title Römische Forschungen. Of his other works, the more important are the Roman Chronology to the Time of Caesar (1838), a work written in conjunction with his brother August; his editions of the Monumentum Ancyranum and of the Digest in the Corpus juris civilis, and of the Chronica of Cassiodorus in Monumen
ta Germaniae historic a, the Audaces antiquissimis section of which was under his supervision. A great part of his work is to be found in the volumes written for the German learned publications such as Hermes, Rheinisches Museum, &c. His Reden und Aufsätze and Gesammelte Schriften, i. ii., were published after his death. A full list of his works is given by Zangemeister, Mommsen als Schriftsteller (1887; continued by M. Jacob, 1897). Among the monographs by Mommsen are: Annales (1895) and Grabanwitz (1904), in the Zeitschrift der Sapyrus-Stiftung für Hochschule, and O. Hirschfeld, Gedächtnissrede auf Theodor Mommsen (1904).

MOMORDICA, in botany, a genus of annual or perennial climbing herbs belonging to the natural order Cucurbitaceae, natives of the tropics, especially Africa, and known in cultivation chiefly as hothouse plants. They are grown for their ornamental fleshy fruits, which are oblong in shape, orange to red in colour, prickly or warty externally, and burst when ripe, generally with elastic force, into irregular valves. M. Balsamina, known as balsam apple, is a very pretty annual, well adapted for trellises, &c., in warm outside situations.

MOMUS, in Greek mythology, the son of Nêr (Night), the personification of censoriousness. He is frequently mentioned in Lucian as the lampooner of the gods. It is said that Pallais, Hephaestus, and Poseidon entered into a competition as to which of them could create the most useful thing. Hephaestus made a man, Poseidon an ox, Pallais a house. Momus, being called upon to pronounce an opinion as to the merits of these productions, expressed dissatisfaction with all: with the man, because a window ought to have been made in his breast, through which his heart could be seen; with the ox, because its horns were in the wrong place; with the house, because it ought to have been portable, so as to be easily moved to avoid unpleasant neighbours. Momus is reported to have burst with chagrin at being unable to find any but the most trifling defects in Aphrodite. He is represented sometimes as a young man, sometimes as an old man, wearing a mask, and carrying a fool's bag.

Hesiod, Theogony, 214; Lucian, Hermotimus, 20, and especially Deorum Concilium; Philostratus, Epistolae, 37.

MONA, the name used by classical writers, and in particular by Tacitus, to denote Anglesey (q.v.). This island was raided by the Roman general Suetonius about A.D. 60 and conquered by Agricola about A.D. 79. The Romans probably mined copper there, but no trace has yet been found of any Roman military post, and the villages of the inhabitants which have been recently excavated show only mediocre traces of Roman civilization. The name Mona seems also to have been occasionally used, perhaps from ignorance, for the other large island lying between England and Ireland, Man. The ancient name of this latter was probably not unlike that of Mona, but is not accurately known to us (Monapia, Manavia).

(F. J. H.)

MONACO, a territory of south-eastern France, the smallest of the sovereign principalities of Europe. Area about 8 sq. m., the length being 21 m. and the width varying from 165 to 1100 yds. Pop. (1900), 15,186. Monaco is situated on the coast of the Mediterranean, 9 m. east of Nice, and is bounded on all sides by the French Republic. It is divided administratively into the towns of Monaco (1902), Condamine (6218) and Monte Carlo (1794). The principality at one time included Mentone and Roccabruna, now known as Roquebrune, which towns, however, were ceded to France in 1861 for a sum of four million francs. The town of Monaco occupies the level summit of a rocky headland, rising about 200 ft. from the shore, and still defended by ramparts. Though largely modernized, the palace is an interesting specimen of Renaissance architecture; the "cathedral" (Romanesque-Byzantine style), and the oceanographical museum may also be mentioned. For this museum a fine building, appropriately decorated, was opened in March 1910 by the prince of Monaco. It stands on the edge of the cliff rising from the sea at the gardens of St Martin, and was designed to house the collections made by the prince during twenty-five years of oceanographical research, and others. Behind the rock, between Mont Tête de Chien and Mont de la Justice, the high grounds rise towards La Turbie, the village on the hill which takes its name from the tropæa with which Augustus marked the boundary between Gaul and Italy. On the north lies the bay of Monaco; along the lower ground on the west of the bay stretches the health and bathing resort of Condamine; with orange-gardens, manufactu

There appear to have been gambling-tables at Monte Carlo
in the year 1856, but it was in 1861 that François Blanc, seeing his tenancy at Homburg coming to an end, with no hope of renewal, obtained a concession for fifty years from Charles III. This concession passed into the hands of a joint-stock company, which in 1869 obtained an extension to 1947, in return for a payment to the prince of £400,000 in 1899 and of £600,000 in 1913, together with an increase of the annual tribute of £50,000 to £70,000 in 1907, £80,000 in 1917, £90,000 in 1927, and £100,000 in 1937. The inhabitants of Monaco have access to the tables; and their interest in the maintenance of the status quo is secured by their complete exemption from taxation and the large prices paid for their lands. The ruler of the principality, Prince Albert, born 1848, succeeded his father, Prince Charles III., in 1889. He married in 1865 Lady Mary Douglas Hamilton, by whom in 1870 he had a son, Prince Louis: that marriage was, however, annulled in 1880, and subsequently Prince Albert married Alice, dowager-duchess of Richelieu, from whom he was divorced in 1902. The prince is absolute ruler, as there is no parliament in the principality. He is advised by a small council of state, the members of which are appointed by himself. The maire and other municipal authorities are also appointed by the prince. A governor-general presides over the administration. The judicial system is the same as that of France, there being a court of first instance and a juge de paix. By arrangement, two Paris judges form a court of appeal. Monaco is the seat of a Roman Catholic bishop.

A temple of Hercules seems to have been built on the Monaco headland by the Phoenicians at a very early date, and the same god was afterwards worshipped there by the Greeks under the surname of Môrousos, whence the name Monaco. Monocci Portus or Portus Herculis is frequently mentioned by the later Latin writers. From the 10th century the place was associated with the Grimaldi, a powerful Genoese family who held high offices under the republic and the emperors; but not till a much later date did it become their permanent possession and residence. In the beginning of the 14th century it was notorious for its piracies. Charles I. (a man of considerable mark, who, after doing great service by sea and land to Philip of Valois in his English wars, was severely wounded at Crecy) purchased Mentone and Roccabruna, and bought up the claims of the Spinola to Monaco. The princes of Monaco continued true to France till 1524, when Augustin Grimaldi threw in his lot with Charles V. Honoré I., Augustin's successor, was made marquis of Campagna and count of Canosa, and people as well as rulers were accorded various important privileges. The right to exact toll from vessels passing the port continued to be exercised till the close of the 18th century. Honoré II. in 1641 threw off the supremacy of Spain and placed himself under the protectorate of France; he was compensated for the loss of Canosa, &c., with the duchy and peerage of Valentinus and various lesser lordships; and "duke of Valentinus" long continued to be the title of the heir-apparent of the principality. In 1731 Antoine, his great-grandson, was succeeded by his daughter Louise Henriette (a woman of Toulon). She married James Matignon and Thorgny, who took the name of Grimaldi and succeeded his wife. The National Convention annexed the principality to France in 1793; restored to the Goyon Grimaldis by the Treaty of Paris in 1814, it was placed by that of Vienna under the protection of Sardinia. The Sardinian government took the opportunity of disturbances that occurred in 1848 to annex Mentone and Roccabruna, which were occupied by a Sardinian garrison till 1859. With the transference of Nice to France in 1860 the principality passed again under French protection.

See H. Métrivet, Monaco et ses princes. La Flèche (1862).

MONAD (Gr. μόρας, unit, from μορός, alone), a philosophic term which now has currency solely in its connexion with the philosophy of Leibnitz. In the earlier Greek philosophy the term meant unity as opposed to duality or plurality; at a later time it meant an individual, or, with the Atomists, an atom. It was first used in a sense approximate to that of Leibnitz by Bruno, who meant by it a primary spiritual element as opposed to the material atom. Leibnitz, however, seems to have borrowed the term not directly from Bruno, but from a contemporary, Van Helmont the younger. Leibnitz's view of things is that the world consists of monads which are immaterial centres of force, each possessing a certain grade of mentality, self-contained and representing the whole universe in miniature, and all combined together by a pre-established harmony. Material things, according to Leibnitz, are in their ultimate nature composed of monads, each soul is a monad, and God is the monas monadum. Thus monadism, or monadology, is a kind of spiritual atomism. The theory has been revived in recent years by C. B. Renouvier.

MONADNOCK, a term derived from Mount Monadnock in New Hampshire, U.S.A., to denote the "isolated remnants of hard rock which remain distinctly above their surroundings in the late stages of erosion cycle" (T. C. Chamberlin, R. D. Salisbury). Examples are frequently found where a hard pipe of igneous rock surrounded by softer rock is gradually exposed by the washing away of the softer rock and becomes a conspicuous feature of the landscape, forming a volcanic "neck," and finally, in the later stages of erosion, a stump. The Peak Downs, Queensland, furnish many examples, and Mato Pepe, Wyoming, is a remarkably conspicuous instance of this type of formation.

MONAGHAN, a county in Ireland in the province of Ulster, bounded E. by Armagh, S.E. by Louth, S. by Meath, S.W. by Cavan, W. by Fermanagh, and N. by Tyrone. The area is 319,741 acres, or about 496 sq. m. The north-western part of the country is included in the great central plain of Ireland; but to the south and east the surface is irregular, although none of the hills is of great elevation. The principal range is that of Slievebeagh, a rugged and barren tract extending into the county Fermanagh, its highest summit being 1254 ft. above sea-level. The principal rivers are the Finn, which rises near the centre of the county and passes into Fermanagh, and the Blackwater, which forms the boundary with Tyrone. The Ulster Canal passes the towns of Monaghan and Clones, affording communication between Lough Neagh and Lough Erne. In geological structure the county drops from the Upper Carboniferous outlier of Slievebeagh in the north-west to a Carboniferous Limestone area towards Monaghan town; but south of this a tumbled Silurian area stretches across the Cavan and Armagh borders. At Carrickmacross, an outlier of Carboniferous Limestone, Coal Measures (with poor seams of coal) and Trias is encountered. Gypsum has been quarried in the Trias, and lead ore was formerly mined in many places in the Silurian area. The Triassic clay furnishes excellent bricks. Eskers or glacial ridges occur at several places. The limestone is not only abundant and good, but from the position of the rocks it can be obtained at small expense in working. Freestone and slates are quarried in considerable quantities. The soil in the more level portions of the county is fertile where it rests on limestone, and there is also a mixed soil of deep clay, which is capable of high cultivation; but in the hilly regions a strong retentive clay soil appears which could be made productive only by careful draining and culture. Spade husbandry generally prevails. The proportion of tillage to pasture is roughly as 1 to 1½. Oats, potatoes and turnips are the principal crops, but the quantity grown decreases. The number of cattle, sheep, pigs, goats and poultry, on the other hand, increases or is well maintained. Linen is the only manufacture of consequence, but the cultivation of flax has almost died out. The Belfast and Clones line of the Great Northern Railway crosses the county from north-east to west, passing the town of Monaghan, and the Dundalk and Clones line of the same company runs from south-east to west, with branches to Carrickmacross and to Coothill (county Cavan).

The population (86,266 in 1891; 74,617 in 1901) decreases as rapidly as any county population in Ireland, and emigration is very heavy. The total includes about 73% of Roman Catholics, and about 13% each of Protestant Episcopalians and of Presbyterians. The principal towns are Monaghan (the county town, pop. 2993), Clones (2668), Carrickmacross (1874),
MONAGHAN—MONARCHY

Castleblaney (1576) and Ballybay (1208). The county includes five baronies. Assizes are held at Monaghan, and quarter sessions at Carrickmacross, Castleblaney, Clones and Monaghan. The two county members sit for the north and south divisions respectively. The county is in the Protestant and Roman Catholic dioceses of Clogher.

The district now called the county Monaghan was included in the district of Uriel or Orgil, and long known as Macmahon's country. It was made shire ground under its present name by Sir John Perrot in the reign of Elizabeth. At Clones there is a round tower in good preservation, but very rude in its masonry; another at Inishkeen is in ruins. Near Clones there are two large raths. Although there are several Danish forts there are no medieval castles of importance. The only monastic structure of which any vestiges remain is the abbey of Clones, which was also the seat of a bishopric. The abbey dates from the 6th century, but was rebuilt in the 14th century after destruction by fire.

MONAGHAN, a market town and the county town of county Monaghan, Ireland, on the Ulster Canal and the Belfast and Clones line of the Great Northern railway, by which it is 52 m. S.W. by W. of Dublin. Pop. (1901), 29,42. There is a modern Roman Catholic cathedral (1850-1852) for the diocese of Clogher, a collegiate church of St. Peter and St. Paul, and a Protestant church (1856), and the public and county buildings include court-house, gaol, workhouse, asylum, hospital and barracks. Educational establishments include a national model school and the college of St. Macartan, preparatory for the Roman Catholic priesthood. The town takes its name (Muiñechn, the town of monks) from an early monastery. It was incorporated by James I., but was little more than a hamlet until the close of the 18th century. Rossmore Park, the fine demesne of Lord Rossmore, is the most noteworthy of several neighbouring residences. The town is governed by an urban district council.

MONA MONKEY, a West African representative of the group of monkeys generally known as guenons, and scientifically as Ceropithecus. The Mona (C. Mona) typifies a sub-genus of the same name (Mona) characterized, among other features, by the presence of a black band running from the angle of each eye to the ear. In the Mona itself the general colour of the upper parts is black, with a pair of oval white spots near the root of the tail, while a band across the forehead and the whole under surface are like the white of the eye. See also Cercopithecus.

MACHARISME, a theological term designating the view taken by those Christians who, within the Church, towards the end of the 2nd century and during the 3rd, opposed the doctrine of an independent personal subsistence of the Logos. During the middle of the 2nd century a number of varying christological views began to germinate, growing for a time side by side. They fell into two great classes: (a) Christ was a man in whom the Spirit of God dwelt; (b) Christ was the Divine Spirit who had assumed flesh. Each class based its position on Scripture, but the latter (which prevailed) had the advantage of being able easily to combine with cosmological and theological propositions current in the religious philosophy of the time. The opposition to it arose out of a fear that it threatened monothelitism. The representatives of the extreme monothelitistic view, which while regarding Christ as Redeemer, clung tenaciously to the numerical unity of the Deity, were called Monarchians, a term brought into general use by Tertullian. It has to be remembered (1) that the movement originated within the pale of the Church, and had a great deal in common with that which it opposed; (2) that it was anterior in time to the council of Nicaea; (3) that the New Testament had not yet been established. It is usual to speak of two kinds of monarchism—the dynamic and the modalistic, though the distinction cannot be carried without some straining of the texts. By monarchians of the former class Christ was held to be a mere man, miraculously conceived indeed, but constituted the Son of God simply by the infinitely high degree in which he had been filled with Divine wisdom and power. This view was represented in Asia Minor about the year 170 by the anti-Montanist Alogi, so called by

Epiphanius on account of their rejection of the Fourth Gospel; it was also taught at Rome about the end of the 2nd century by Theodotus of Byzantium, a currier, who was excommunicated by Bishop Victor, and at a later date by Artemon, excommunicated by Zephyrinus. About the year 260 it was again pronounced within the Church by Paul of Samosata (q.v.), who held that, by his unique excellency, the man Jesus gradually rose to the Divine dignity, so as to be worthy of the name of God. Modalistic monarchianism, conceiving that the whole fullness of the Godhead dwelt in Christ, took exception to the "subordinatianism" of some Church writers, and maintained that the names Father and Son were only two different designations of the same subject, the one God, who "with reference to the relations in which He had previously stood to the world is called the Father, but in reference to His appearance in humanity is called the Son." It was first taught, in the interests of the "monarchia" of God, by Praxeas, a confessor from Asia Minor, in Rome about 110, and was opposed by Tertullian in his well-known controversial tract. The same view—the "patristic" as it was called, because it implied that God the Father had suffered on the cross—obtained fresh support in Rome about 215 from certain disciples of Noetus of Smyrna, who received a modified support from Bishop Callistus. It was on this account that Tertullian, the champion of hypostatic subordinationism, along with his adherents, withdrew from the obedience of Callistus, and formed a separate community. In Carthage, Praxeas for a time had some success, but was forced by Tertullian not only to desist but to retract. A new and conciliatory phase of patristicism was expounded at a somewhat later date by Beryllus of Bostra, who, while holding the divinity of Christ not to be 

οἰδα, or proper to Himself, but ἀπαντηθεί (belonging to the Father), yet recognized in His personality a new παράστασις or form of manifestation on the part of God. Beryllus, however, was convinced of the wrongness of this view by Origen (q.v.), and recanted at the synod which had been called together in 244 to discuss it. (For the subsequent history of modalistic monarchianism see SABELLUS.)

See the Histories of Dogma by A. Harnack, F. Loofs, R. Seeberg; also R. L. Ottley, The Doctrine of the Incarnation.

MONARCHY (Fr. monarchie, from Lat. monarcia, Gr. μοναρχία, rule of one, μόνος, alone, ἀρχή, ruler, strictly, the undivided sovereignty or rule of a single person. Hence the term is applied to states in which the supreme authority is vested in a single person who is regarded as the successor of his predecessors, but is in his right the permanent head of the state. The characteristic of true monarchy is well defined in the well-known lines of Cowper (Verses supposed to be written by Alexander Selkirk):

"I am monarch of all I survey,
My right there is none to dispute."

The word "monarchy" has, however, outlived this original meaning, and is now used, when used at all, somewhat loosely of states ruled over by hereditary sovereigns, as distinct from republics with elected presidents; or for the "monarchical principle," as opposed to the republican, involved in this distinction.

The old idea of monarchy, viz. that of the prince as representing within the limits of his dominions the monarchy of God over all things, culminated in the 17th century in the doctrine of the divine right of kings, and was defined in the famous dictum of Louis XIV.: L'état c'est moi. The conception of monarchy was derived from Christianity from the theocracies of the East; it was the underlying principle of the medieval empire and also of the medieval papacy, the rule of the popes during the period of its greatest development being sometimes called "the papal monarchy." The monarchical principle was shaken to its foundations by the English revolution of 1688; it was shattered by the French revolution of 1789; and though it survives as a political force, more or less strongly, in most European countries, "monarchists," in the strict sense of the word, are everywhere a small and dwindling minority. To express the change phrases were invented which have come into general use, though involving a certain contradiction in terms, viz. "limited" or
“constitutional monarchy,” as opposed to “absolute” or “hereditary monarchy.”

Finally, a distinction is drawn between “elective” and “hereditary” monarchies. Of the former class the most conspicuous was the Holy Roman Empire; but in Europe all monarchies were, within certain limits, originally elective; and, after the introduction of Christianity, the essential condition of the assumption of sovereign power was not so much kinship with the reigning family as the “sacring” by the divine authority of the Church. The purely hereditary principle was of comparatively late growth, the outcome of obvious convenience, exalted under the influence of various forces into a religious or quasi-religious dogma. (See also Government and Sovereignty.)

MONASSIR (Monassir), an African tribe of Semitic stock, living in the Nile valley (Berber mudiria) between Birti (their headquarters) and Dar Robatab. They are a prosperous, sedentary tribe, claim kinship with the Ababda, and speak Arabic, but are of very mixed blood. Next to Birti their chief settlement is at Salamat. Both places are on the left bank of the Nile. It was by Monassir tribesmen that Colonel J. D. H. Stewart, Gordon’s comrade at Khartum, was murdered in 1884.

MONASTICISM (Gr. μοναστικός, living alone, μονος), a system of living which owes its origin to those tendencies of the human soul which are summed up in the terms “asceticism” and “mysticism.” Mysticism may broadly be described as the effort to give effect to the craving for a union of the soul with the Deity already in this life; and asceticism as the effort to give effect to the hankerings after an ever-progressive purification of the soul and an attaining of for sin by renunciation and self-denial in things lawful. These two tendencies may well be said to be general instincts of humanity; because, though not always called into activity, they are always liable to be evoked, and in all ages and among all races they frequently have asserted themselves. (See Asceticism and Mysticism.) Indeed the history of religion shows that they are among the most deep-rooted and widespread instincts of the human soul; and monasticism is the attempt to develop and regulate their exercise. Thus monasticism is not a creation of Christianity; it is much older, and before the Christian era a highly organized monasticism existed in India. (See the articles on Brahmanism; Buddhism; and Lhasa.)

1. Pre-Christian Monasticism.—Greek asceticism and mysticism seem never to have produced a monastic system; but among the Jews, both in Judaea and in Alexandria, this development took place. In Judaea the Essenes before the time of Christ lived a fully organized monastic life (see Schürer, Jewish People, ii. § 30); and the same is true in regard to the Therapeutae in the neighbourhood of Alexandria (the authenticity of Philo’s De Vita contemplativa, which describes their manner of life, is again recognized by scholars).

A general sketch of pre-Christian asceticism and monasticism, with intimation of the chief authorities, is given in O. Zöckler’s Askese und Monachism (1897), pp. 32–135. This account is epitomized by J. O. Hannay, Spirit and Origin of Christian Monasticism (1903), app. 1: the view now commonly adopted is that these pre-Christian systems of asceticism and mysticism originated from the more southerly parts of Egypt. Here, at Tabennisi near Derdona, about 315–320, St Pachomius (q.v.) established the first Christian cenobium, or monastery properly so called. (On St Pachomius and his monastic institute see P. Ladeuze, Cenobitisme Pachomien (1898); Schwietz, op. cit. pt. ii. §§ 12–16; E. C. Butler, op. cit. i. p. 234, pt. ii. notes 48, 49, 54, 59). Before his death in 346 Pachomius had established nine monasteries of men and one of women, and after his death other foundations continued to be made in all parts of Egypt, but especially in the south, and in Abyssinia. Palladius tells us that c. 410 the Pachomian or Tabennesi monasteries numbered some seven thousand. The life was fully cenobitical, regulated in all details by minute rules, and with prayer and meals in common. As contrasted with the Antonian ideal, the special feature was the highly organized system of work, whereby the monastery was a sort of agricultural and industrial colony. The work was an integral part which St Anthony (q.v.) began to lead, c. 270; but after fifteen years he withdrew to a deserted fort on the east bank of the Nile, opposite the Fayum. Here he enclosed himself and led a life cut off from all intercourse with man. There are reasons for doubting that Anthony was the first Christian hermit; probably there is some historical foundation for the tradition that one of those who fled to the desert in the Decian persecution continued to dwell in a cave by the shore of the Red Sea, unknown to men, till visited by St Anthony long years afterwards (see E. C. Butler, Lusiac History of Palladius, 1898, pt. i. p. 230). But this was a single case which does not affect the fixed tradition of monastic Egypt in the 4th century that Anthony was the father of Christian monachism.

During twenty years Anthony lived a life of seclusion, never coming forth from his fort, never seeing the face of man. But his fame went abroad and a number of would-be disciples came and took up their abode in the caves and among the rocks that surrounded his retreat, and called on him to guide them in the path of life they had chosen. In response to these appeals Anthony came forth and set himself to organize the life of the multitude of ascetics that had found their way to him. This act, which took place in the first years of the 4th century, must be regarded as the inauguration of Christian monachism.

3. St Anthony’s Monachism.—The form of monastic life directly derived from St Anthony was the type that prevailed in middle and northern Egypt up to the middle of the 5th century. The chief authorities for the study of this type of monasticism are the Vita Antonii (probably by Athanasius), the Historia monachorum (ed. E. Preuschen), the Historia lausiaci of Palladius (ed. E. C. Butler)—these works are to be found in Latin in Roswey’s Vitae Patrum (Migne, Patrol Lat. LXXII., LXXIV.)—and the writings of Cassian (English translation by Gibson in “Nicene and Post-Nicene Library”). A generation ago all this literature was in disrepute; but it has been revived, and its substantially historical character is now recognized on all hands (see E. C. Butler, op. cit. pt. ii. § 1).

Antonian monachism grew out of the purely eremitical life, and it retained many of the characteristic features inherited from its origin. The party of travellers whose journey is narrated in the Historia monachorum found at the chief towns along the Nile from Assyut to Alexandria, and in the deserts that fringed the river, monastic habitations, sometimes of hermits, sometimes of several monks living together but rather the life of hermits than of cenobites. It is at the great monastic settlements of Nitra and Scebe that we are best able to study this kind of Egyptian monasticism. Here in one portion of the desert, named Celia, the monks lived a purely eremitical life; but in Nitra (the Wadi Natron) they lived either alone, or two or three together, or in communities, as they preferred. The system was largely voluntary; there was no organized community life, no living according to rule, as it is now understood. In short the life continued to be semi-eremitical. (See Butler, op. cit. pt. i. p. 233; Hannay, op. cit. chs. 4, 5; Schwietz, op. cit. pt. ii. §§ 11–14.)

4. St Pachomius’s Monachism.—Very different was the type of monasticism that prevailed in the more southerly parts of Egypt. Here, at Tabennisi near Dendera, about 315–320, St Pachomius (q.v.) established the first Christian cenobium, or monastery properly so called. (On St Pachomius and his monastic institute see P. Ladeuze, Cenobitisme Pachomien (1898); Schwietz, op. cit. pt. ii. §§ 12–16; E. C. Butler, op. cit. i. p. 234, pt. ii. notes 48, 49, 54, 59). Before his death in 346 Pachomius had established nine monasteries of men and one of women, and after his death other foundations continued to be made in all parts of Egypt, but especially in the south, and in Abyssinia. Palladius tells us that c. 410 the Pachomian or Tabennesi monasteries numbered some seven thousand. The life was fully cenobitical, regulated in all details by minute rules, and with prayer and meals in common. As contrasted with the Antonian ideal, the special feature was the highly organized system of work, whereby the monastery was a sort of agricultural and industrial colony. The work was an integral part
of the life, and was undertaken for its own sake and not merely for an occupation, as among the Antonian monks. This marks a distinctly new departure in the monastic ideal.

In another respect, St. Pachomius made a new ground: not only did he inaugurate Christian cenobitical life, but he also created the first "Religious Order." The abbot of the head monastery was the superior-general of the whole institute; he nominated the superiors of the other monasteries; he was visitor and held periodical visitations at all of them; he exercised universal supervision, control and authority; and every year a general chapter was held at the head house. This is a curious anticipation of the highly organized and centralized forms of government in religious orders, not met with again till Cluny, Citeaux, and the Mendicant orders in the later middle ages.

A passing reference should be made to the Coptic abbot Shenout, who governed on similar lines the great "White Monastery," whereof the ruins still survive near Akhmim; the main interest of Shenout's institute lies in the fact that it continued purely Coptic, without any infiltration of Greek ideas or influence. (See J. Leipoldt, Schenute von Aritpe, 1903.)

Egyptian monachism began to wane towards the end of the 5th century, and since the Mahomedan occupation it has ever been declining. Accounts of its present condition may be found in R. Curzon's Monasteries of the Levant (1857), or in A. J. Butler's Ancient Coptic Churches (1884). Hardly a dozen monasteries survive, inhabited by small and ebbing dwindling communities.

5. Oriental Monachism.—The monastic institution was imported early in the 4th century from Egypt into Syria and the Oriental lands. Here it had a great vogue, and under the influence of the innate Asiatic love of asceticism it tended to assume the form of strange austerities, of a kind not found in Egyptian monachism in its best period. The most celebrated was the life of the Stylists or pillar hermits (see Simeon Stylites). Monastic life here tended to revert to the eremitical form, and to this day Syrian and Armenian monks are to be found dwelling in caverns and desert places, and given up wholly to the practice of austerity and contemplation (see E. C. Butler, Lausiac History of Palladius, pt. i. p. 239, where the chief authorities are indicated).

Before the close of the 4th century monachism spread into Persia, Babylonia and Arabia.

6. Basilian and Greek Monachism.—Though Eustathius of Sebaste was the first to introduce the monastic life within the confines of what may be called Greek Christianity in Asia Minor (c. 340), it was St. Basil who adapted it to Greek and European ideas and needs. His monastic legislation is explained and the history of his institute sketched in the article Basilian Monks. Here it will suffice to say that he followed the Pachomian rather than the Antonian model, setting himself definitely against the practice of the eremitical life and for asceticism, and inculcating the necessity and superiority of labour. The lines laid down by St. Basil have continued ever since to be the lines in which Greek and Slavonic monachism has rested, the new multitudinous modifications of the monastic ideal, developed in such abundance in the Latin Church, having no counterpart in the Greek. But the element of work has decreased, and Greek and Slavonic monks give themselves up for the most part to devotional contemplation.

7. Early Western Monachism.—The knowledge of the monastic life was carried to western Europe by St. Athanasius, who in 340 went to Rome accompanied by two monks. The Vita Antonii was at an early date translated into Latin and propagated in the West, and the practice of monastic asceticism after the Egyptian model became common in Rome and throughout Italy, and before long spread to Gaul and to northern Africa. A résumé of the chief facts will be found in E. C. Butler, op. cit. pt. i. p. 245; see also Hanny, op. cit. ch. 7. The monastic ideals prevalent were those of the Antonian monachism, with its hankering after the eremitical life and the practice of extreme bodily austerities. But climatic conditions and racial temperament rendered the Oriental manner of monachism unattainable, as a rule, in the West. Hence it came to pass that by the end of the 5th century the monastic institute in western Europe, and especially in Italy, was in a disorganized condition, sinking under the weight of traditions inherited from the East. It was St. Benedict who effected as permanently working adaptation of the monastic ideal and life to the requirements and conditions of the western races.

8. St. Benedict's Monachism.—St. Benedict (c. 500) effected his purpose by a twofold break with the past: he eliminated from the idea of the monastic life the element of Oriental asceticism and extreme bodily austerities; and he put down the tendency, so marked in Egypt and the East, for the monks to vie with one another in ascetical practices, commanding all to live according to the rule. The life was to be self-denying and hard, but not one of any great austerity (for details see Benedict of Nursia; and E. C. Butler, op. cit. pt. i. pp. 237 and 251). The individual monk was sunk in the community, whose corporate life he had to live, St. Benedict's rule was a new creation in monastic history; and as it rapidly supplanted all other monastic rules in western Europe, and was for several centuries the only form of monasticism in Latin Christianity (outside of Ireland), it is necessary to speak in some little detail of its spirit and inner character. It has to be emphasized at the outset that the monasteries in which the Benedictine rule was the basis of the life did not form a body or group apart within the great "monastic order," which embraced all monasteries of whatever rule; nor had Benedictine monasteries any special work or office of any kind. There was no central office of the councils or of the abbots, or of the monks, or of the elections of abbots. The monk was to live as unconsciously as possible of his own life or of his surroundings. The monk was in a word to be in the condition of the new man, in the condition of the new life" (Reg. c. 11). The great act of service is the public common celebration of the canonical office, the "work of God" he calls it, to which "nothing is to be preferred" (Reg. c. 43). The rest of the day is filled up with a round of work and reading. Work, and in St. Benedict's time it was primarily field work, took an even more recognized and integral place in the life than was the case under St. Pachomius or St. Basil, occupying notably more time than the church services. St. Benedict introduced too into the monastic life the idea of law and order, of rule binding on the abbot no less than on the monks; thus he reduced almost to a vanishing point the element of arbitrariness, or mere dependence on the abbots' will and whim, found in the earlier rules. Lastly, he introduced the idea of stability, whereby monk and community were bound to each other for life, the normal thing for the Benedictine being to live and die in the monastery of his profession: thus the power hitherto enjoyed by monks, of wandering from monastery to monastery, was cut away, and the Benedictine community was made into a family whose members were bound to one another by bonds (see above, Reg. c. 11). The introduction of the translation of the Rule of St. Benedict in the 2nd edition of the translation of Montalembert's Monks of the West (1895).

The only serious rival was the Irish rule of Columban; and here it will be in place to say a word on Irish monachism, which, in its birthplace, stood aloof to the end from the general movement. The beginnings of Celtic monachism are obscure, but it seems to have been closely connected with the tribal system. When, however, Irish monachism emerged into the full light of history, it was in its manifestations closely akin to the Egyptian, or even to the Syrian type: there was the same love of the eremitical life, the same craving after bodily austerities of an extraordinary kind, the same individualistic piety. The Irish monks were great missionaries in the north of England and the northern and western parts of Europe; and their learning and asceticism had a great influence on the whole European monachism.
MONASTICISM

689

central parts of Europe, and in the course of the 7th century the Irish rule of St Columban and the Roman rule of St Benedict met in the monasteries in central Europe that had been founded by Columban and his Irish monks. The Benedictine rule supplanted the Irish so inevitably that the personnel ceased to be Irish, that even in St Columban's own monastery of Luxeuil his rule was no longer observed, and by Charlemagne's time all remembrance of any other monastic rule than the Benedictine had died out.

During the 7th and 8th centuries the Benedictine houses were the chief instrument in the christianizing, civilizing and educating of the Teutonic races. In spite of the frequent pillage and destruction of monasteries by Northmen, Saracens, Arabs and other invaders; in spite of the existence of even widespread local abuses, St Benedict's institute went on progressive and consolidating; and on the whole it may be said that throughout the early middle ages the general run of Benedictine houses continued to perform with substantial fidelity the religious and social functions for which they were created.

10. Offshoots and Modifications of Benedictine Monachism: the Rise of "Orders."—Up to the beginning of the 10th century we do not meet in the West such a thing as an "order"—an organized corporate body composed of several houses, diffused through various lands, with centralized government and objects and methods of its own. As stated above, St Fachmonius's monasteries formed an order—a curious anticipation of what six centuries later was to become the vogue in Western monasticism. The Benedictine houses never coalesced in this manner; even when, later on, a system of national congregations was introduced, they were but loose federations of autonomous abbeys; so that to this day, though the convenient expression "Benedictine order" is frequently used, the Benedictines do not form an order in the proper sense of the word. But with the 10th century we reach the period of orders, and it is on this line that all subsequent developments in Western monasticism have run.

The first order was that of Cluny, founded in 910; in rule and manner of life it continued purely Benedictine, and it wielded extraordinary power and religious influence up to the middle of the 12th century. (See CLUNY.)

The chief offshoot from this Benedictine institute were the Cistercians. The fundamental idea was a return to the letter of St Benedict's rule, and a reproduction, as close as could be, of the exterior conditions of life as they existed in St Benedict's own monastery; consequently field work held a prominent place in the Cistercian ideal. This ideal it has not been possible permanently to maintain in the great body of the order, but only in limited circles, as Trappists (q.v.). But for a century (1125-1225) Citeaux supplanted Cluny as the spiritual centre of western Europe. The Cistercians were an organized, centralized order in the full sense of the word. (See CISTERCIANS.)

Towards the end of the 10th century and during the 11th a strong tendency set in to revert to the eremitical life, probably owing to the example of the Greek monks, who at this time entered Sicily and south Italy in great numbers. This tendency produced the orders of the Camaldulans or Camaldolese (c. 975) in Italy, and in France the Grandmontines (1056) and Carthusians (1084), all leading practically eremitical lives, and assembling ordinarily only for the church services. The Vallombrosians (1068) near Florence maintained a cenobitical life, but eliminated every element of Benedictine life that was not devoted to pure contemplation. At Fontevrault (founded in 1093) the special feature was the system of "double monasteries" i.e. neighbouring, but rigorously separated, monasteries of men and of women—the government being in the hands of the abbesses.

In all these lesser orders may be discerned the tendency of a return to the elements of Eastern monasticism discarded by St Benedict—to the eremitical life; to the purely contemplative life with little or no factor of work; to the undertaking of rigorous bodily austerities and penances—it was at this time that the practice of self-inflicted scourgings as a penitential exercise was introduced. All this was a reaction from St Benedict's reconstruction of the monastic life, a reaction which in the matter of austerities and individualistic piety has made itself increasingly felt in the later manifestations of the monastic ideal in the West.

11. New Kinds of Religious Orders.—Up to this point we have met only with monasticism proper; and if the term were taken strictly, the remainder of this article would be concerned only with the later history of the institutes already spoken of; for neither canons regular, friars, nor regular clerks, are in the strict sense monks. But it is usual, and it will be convenient here, to use the term monasticism in a broader sense, as equivalent to the technical "religious life," and as embracing the various forms that have come into being so prolifically in the Latin Church at all periods since the middle of the 11th century.

The first of these new forms was that of the canons regular or Augustinian canons (q.v.) who about the year 1060 arose out of the older semi-monastic canonical institute, and lived according to the so-called "Rule of St Augustine." The essential difference between monks and regular canons may be explained as follows: monks, whether hermits or cenobites, are men who live a certain kind of life for its own sake, for the purpose of leading a Christian life according to the Gospel's counsel and thus securing a direct share in the divine life; on the other hand, friars, whether of the monastic or the mendicant order, are either members of an established religious community, monastic or mendicant, or are individuals who live the monastic or mendicant life apart from any such community. In either case, the monastic or mendicant life is a thing that can be lived by individuals of both sexes and all ages, and is not limited to its original and proper clerical state. The difference manifested itself in one external point: Augustinian canons frequently and freely themselves served the parish churches in the patronage of their houses; Benedictine monks did so, speaking broadly, hardly at all, and their doing so was forbidden by law, both ecclesiastical and civil. In other respects the life of canons regular in their monasteries, and the external policy and organization among their houses, differed little from what prevailed among the Black Benedictines; their superiors were usually provosts or priors, but sometimes abbots. As contrasted with the friars they are counted among the monastic orders; among the mendicants, federations or congregations of houses of Augustinian canons were formed the Premonstratensian order (1120) (q.v.), and the English "double order" of St Gilbert of Sempringham (1148) (q.v.), both orders, in the full sense of the word, composed of Augustinian canons.

Two special kinds of orders arose out of the religious wars waged by Christendom against the Mahomedans in the Holy Land and in Spain: (1) the Military orders: the Knights Hospitallers of St John and the Knights Templars, both at the beginning of the 12th century, and the Teutonic Knights at its close; (2) the orders of Ransom, whose object was to free Christian prisoners and slaves from captivity under the Mahomedans, the members being bound by vow even to offer themselves in exchange; such orders were the Trinitarians (q.v.) founded in 1198, and the order of Our Lady of Ransom (de Merce), founded by St Peter Nolasco in 1223; both were under the Augustinian rule.

At the beginning of the 13th century arose the series of great Mendicant orders. Their nature and work and the needs that called them into being are explained in the article MENDICANT MOVEMENT, and in the separate articles on St Francis of Assisi and Franciscains (1216), St Dominic and Dominicans (1215), Carmelites (1215), Augustinian Hermits (1216)—these were the four great orders of Mendicant friars—to them were added, in 1497, the Servites (q.v.) founded in 1223.

It will be in place here to explain the difference between friars, monks, and canons regular. The distinction between the two last has already been brought out; but they agree in this that the individual monk and canon alike belongs to his house of profession and not to any greater or wider corporation. They
MONASTICISM

are bound by place and the unit is the individual community. Thus among monks and canons regular each monastery has its own fixed community, which is in a real sense a family; and the monk or canon, no matter where he may be, looks on his monastery as his “home,” like the ancestral home of a great family. With the friars this is all changed: the friar does not belong to any particular house, but to the province or order, so that there is no reason, beyond the command of his superiors, why he should be living in one house rather than another. In the monk attachment to his own one monastery is a virtue; in the friar detachment is the ideal. The monk, or the canon, normally exercises his influence on the world in and through his community, not as an individual but as a member of a corporate body. The friar’s sphere of work is normally outside his convent, and he works and influences directly and as an individual. Lastly, in regard to the object aimed at there was an important difference, for the professed object of the friars was to be clerical helpers of the parochial clergy in meeting the specifically religious needs of the time. Already, in St Francis’s lifetime, his friars had grown into an order dedicated to spiritual ministrations among the poor, the sick, the ignorant, the outcasts of the great cities; while by the very conception of their institute the Dominicans were dedicated to the special work of preaching, especially to heretics and heathens. Here, too, should be mentioned St Francis’s other great creation, the Tertiaries (q.v.), or devout men and women living in the world, who while continuing their family life and their ordinary avocations, followed a certain rule of life, giving themselves up to more than ordinary prayer and the pursuit of good works, and abstaining from amusements of a worldly kind.

12. The Religious Orders in the Later Middle Ages.—The 13th century was the heyday of monasticism in the West; the Mendicant orders were in their first fervour and enthusiasm; the great abbeys of Benedictines, Cistercians and Augustinian canons were slowly receding. The religious reform movement of Hildebrand’s day, with Hildebrand’s name, and maintained themselves at a high and dignified level in things religious and secular; and under the Benedictine rule were formed the new congregations or orders of Silvestrines (1231), Celestines (c. 1260) and Olivetans (1318), which are described under their several headings. But towards the end of the century a period of decline set in, which ran its course in increasing volume throughout the 14th century. A great wave of secularity rolled over the Church, engulfling the religious orders with the rest; love waxed cold, fervour languished, learning declined, discipline was relaxed, bitter rivalries broke out, especially between Franciscans and Dominicans. The great schism was reflected in the Mendicant orders which were divided into two obediences, to the destruction of discipline. The great wealth of the old monastic orders exposed them, especially in France and Italy, to the vicious system of commendation, whereby a bishop, an ecclesiastic, or even a layman was appointed “commendatory abbot” of a monastery to the purpose of drawing the revenues (see ABBOT); the monasteries were often deprived even of necessary maintenance, the communities dwindled, and regular observance became impossible. There is reason to believe that in England a relatively good level was maintained throughout, thanks in great measure to the fact that the kings resolutely refused to allow the introduction of commendation—Wolsey was the first and last commendatory abbot in England. In the German lands, the lowest level was touched, and the writings of the Augustinian canon Johann Busch, and of the Benedictine abbot Trithemius reveals a state of things in the first half of the 15th century that urgently called for reform. The first move in this direction was made in the Netherlands and north Germany under the influence of Gerhard Groot (q.v.), and issued in the formation of the Windesheim congregation of Augustinian canons and then of the of the Barmen Congregation (1418) (q.v.), founded c. 1384, both of which became centres of religious revival. During the first half of the 15th century numerous and effective efforts at reform were initiated in all the orders without exception, and in every part of Europe. These movements, promoted by the councils of Constance and Basel, partook of the spirit of the time and was characterized by its extreme austerity of life and a certain hardness of spirit, and a sort of polemical regulation easily understandable at a time of reaction from grave abuses. At this time arose the Hieronymites (q.v.) founded in 1375, under the Augustinian rule, the Observants (1415) among the Franciscans (q.v.), and the Minims (founded c. 1460 by St Francis of Paola, q.v.), whose programme was to outdo the Minor or Franciscans. These various reform movements among the orders were widely but not universally successful; and so the Reformation found religious houses in an unsatisfactory state in sufficient numbers to afford the reformers one of their chief handles against the old religion. The Reformation and the religious wars that followed in its wake destroyed the monasteries and religious orders of all kinds in northern Europe and crippled them in central Europe.

13. The Modern Orders.—During the Reformation period there sprang up, to meet the needs of the time, a new kind of religious order, called Regular Clerks. These are religious orders in the full sense of the word, as the members take the solemn religious vows. Regular clerks are by their institute clerics and priests, and they are devoted to some particular work or works as their own special object—as education, the preaching of missions and retreats, or the going on missions to the heathen. They carry still further the tendencies that differentiate the friars from the monks; and in particular, in order to be more free in devoting themselves to their special works, the orders of regular clerks have commonly given up the choral celebration of the canonical office, which had been maintained by the friars.

Of regular clerks by far the most important are the Jesuits (q.v.), founded in 1540; there are also the Theatines (founded 1524 by St Cajetan and Caraffa, afterwards Paul IV); the Barnabites (founded 1559, by St Antonio Zaccaria) and others (see R.A.A., “Kongregationen” (1897), II., §§ 108-114). Strictly speaking the “religious congregations” should be distinguished from the orders of regular clerks, the difference being that in the former the vows, though taken for life, are only “simple vows” and more easily dispensable by authority; but the character and work of the two institutes is very similar. The chief of these congregations are the Passionists (founded by St John of the Cross, 1592) and the Redemptorists (founded by St Alfonso Liguori, 1749), both devoted to giving missions and retreats. The Christian Brothers, devoted to primary education, founded by St Jean Baptiste de la Salle in 1679, are not in orders (Heimbucher, op. cit. §§ 115-118).

Besides the religious congregations there is a number of “secular congregations,” composed of secular priests living together under temporary vows and free to leave at will; the following deserve mention: Oblates of St Charles (founded by St Charles Borromeo, 1578); Oratorians (founded by St Philip Neri, c. 1570); the French Oratory (founded by Cardinal Balue, 1613), a similar but distinct institution, which produces a number of scholars of the highest distinction—Thomassin, Morin, Mariebranche, Richard Simon, Juénin, Lebrun, Masillon, and others; Lazarists (founded by St Vincent de Paul, 1624); Sulpicians (founded by M. Olier, 1642), and a vast number of others, including several for the mission to the heathen (see Heimbucher op. cit. §§ 124-140).

During the period under review, from the Reformation to the French Revolution, the old orders went on alongside of the new, and many notable revivals and congregations arose among them; the most noteworthy were the Capuchins (q.v.) among the Franciscans (1528); the Discalced Carmelites (q.v.) of St Teresa and St John of the Cross (1562); the Trappists (q.v.) among the Cistercians (1663); and, most famous of all, the Maurists (q.v.) among the Benedectines of France (1621).

14. The Religious Orders in Recent Times.—At the end of the 18th century and the opening of the 19th the religious orders received a succession of blows in those countries in which they had survived the Reformation from which they have only
in the present generation recovered. The Jesuits were suppressed by Pope Clement XIV, in 1773, and restored by Pius VII, in 1814. As the result of the ecclesiastical policy of the emperor Joseph II, nearly all religious houses of all kinds were suppressed throughout the Austrian dominions (1787). The French Revolution swept them out of France and caused the secularization of the great majority in central Europe and Italy. In Portugal and Spain they were dissolved in 1834-1835; in Italy in 1866; in the Prussian dominions in 1871. The last half of the 19th century, and more especially the last quarter, witnessed a remarkable revival of vitality and growth in most of the older orders in nearly every country of western Europe, and besides, an extraordinary number of new congregations, devoted to works of every sort, were founded in the 19th century: Heimbucher (op. cit., §§ 118, 134-140) numbers no fewer than seventy of these new congregations of men. In the new countries, especially in the United States and Australia, but also in South Africa, orders and congregations of all kinds are most thriving. The chief set-back has come again in France, where, by the Association Laws of 1903, the religious orders have nearly all been suppressed and expelled and their property confiscated. The Nuns.—In the foregoing sketch nothing has been said concerning the nuns; and yet in all ages women, hardly less than men, have played their part in monasticism. In the earliest Christian times the veiled virgins formed a grade or order apart, more formally separated from the community than were the male ascetics. There is reason for believing that there were organized convents for women before there were any for men; for when St Anthony left the world in 270 to embrace the ascetic life, the Vita says he placed his sister in a nunnery (vrapšešův). We learn from Palladius that by the end of the 4th century nunneries were numerous all over Egypt, and they existed also in Palestine, in Italy and in Africa—in fact throughout the Christian world. It is a curious coincidence that the sister of each of the three great cenobitical founders, Pachomius, Basil and Benedict, was a nun and ruled a community of nuns according to an adaptation of her brother's rule for monks. In the West the Benedictine nuns played a great part in the Christian settlement of north-western Europe. As the various monastic and mendicant orders arose, a female branch was in most cases formed alongside of the order; and so we find canonesses, and hermitesses, and Dominicanesses, and Franciscan nuns [or Claras (g.v.)]—requisite information will be found in the respective articles. Then there were the “double orders” of Sempringham (see St Gilbert) and Fontevrault, in which the nuns were the predominant, or even the dominant, element. Of the modern orders of men only a few include nuns. But on the other hand there are a vast number of purely female orders and congregations. The great majority of these modern congregations of women follow the Augustinian rule, supplemented by special constitutions or by-laws; such as the Brigitines, the Ursulines and the Visitations: others follow the rule of the third order of the Franciscans or other Mendicants (see TERTIARIES). In early times nuns could go out of their property to perform; but in the later middle ages, according to the council of Trent, the tendency was to keep them more and more strictly confined within their convent precincts. In 1609 an English lady, Mary Ward, founded at Munich the “Institute of Mary,” the nuns of which were not bound to enclosure. This new departure, or rather, return to old ideas, encountered vehement opposition and difficulties that nearly wrecked it; but it has survived, and has been the pioneer in the extraordinary development of institutes of women devoted to external good works of every kind. St Vincent of Paul soon followed; in 1633 he established the Sisters of Charity, bound only by yearly vows, and wholly given up to works of charity—chiefly nursing in hospitals and in the homes of the poor, and primary education in poor schools. As women are debarred from exercising the spiritual functions of the ministry, it follows that nuns have to devote themselves either to a more purely contemplative life, or else to a more wholly active one, than is usual among the orders of men, who commonly, in virtue of their priesthood, have been able to find a mixed form of life between the two extremes. The nuns belonging to the older orders tend to the contemplative idea, and they still find recruits in sufficient numbers, in spite of the modern rush to the active congregations. These latter exist in wondrous number and variety, exercising every imaginable form of good work—education, both primary and secondary; the care of hospitals, orphanages, penitentiaries, prisons; of asylums for the blind, the deaf and dumb, the insane; of refuges for the aged poor and the destitute. See the works of Heliot and Heimbucher, referred to below under “Literature”; also Lina Eckenstein, Woman under Monasticism (1896); and for information on the various orders of women, J. M. Malleson’s Terra incognita (1873); and F. M. Steele, Converts of Great Britain and Ireland (1902). 16. Conclusion.—Few phenomena are more striking than the change that has come over educated Protestant opinion in its estimate of monasticism. The older Protestantism uncompromisingly judged the monastic ideal and life to be both unchristian and unnatural, an absolute perversion deserving nothing but condemnation. But now the view of the critico-historical school of Protestant thought, of which Dr Adolf Harnack is so representative a spokesman, is that the preservation of spiritual religion in Catholic Christianity, both Eastern and Western, has been mainly, if not wholly, due to monasticism (see Harnack’s early tracts Das Manichtum, translated under the title Monasticism, by E. L. Coltett, 1881; and the lectures to Greek and Roman Catholicism in Das Wesen der Christenheit, translated by Bailey Saunders, 1902; the first-named work is the most suggestive general aperçu of the whole subject—though written from a frankly hostile standpoint, it is in large measure a panegyric). The views of the new Protestantism concerning monasticism are probably no less excessive than those of the old. The truth probably lies somewhere between them. It may perhaps be agreed that not the least of the services rendered to the Christian people at large by monasticism is this: Into every life the spirit of renunciation must enter; in most lives there are crises in which the path of mere duty can be followed only in virtue of a great renunciation; if we are able to make these ordinary and necessary renunciations, it is in some measure owing to the fact that the path has been made easier for us by those who (like the author of the Imitation of Christ) have shown the example, and thereby been able to formulate the theory, of renunciation in a supreme degree. LITERATURE.—The literature on monasticism is immense. The chief repertory for information on the historical side is Heliot’s Histoire des ordres religieux (8 vols., 1714; 2nd ed. 1702; digested in dictionary form by Migne, 1860). This information has been condensed and translated by Dr Bailey’s Monasticism (2 vols., 1896-1897; 2nd ed. in 3 vols., 1902) —this most useful handbook is equipped throughout with an excellent and well chosen bibliography. Otto Zöckler’s Askese und Monchtum (1897), which covers the whole ground, and is written more from the point of view of theory. The inner spirit and working of the older monasticism is well portrayed in F. A. Gasquet’s English Monastic Life (1904); more popular accounts are given in H. J. Pease’s Monasticism (1898), and F. M. Steele’s Monasteries and Religious Houses of Great Britain (1893). More recent is the treatment in Brockie’s edition of Holsten’s Codex regulorum (6 vols., 1795). The article Monastichum in Herzog-Hauck Realencyclopädie (3rd ed.), and in Wetzer and Wilte Kirchenlexikon (2nd ed.) go over the same general ground in the present article, in the earlier portion entering into greater detail as to facts, but in the later dealing much more summarily. The relevant separate articles in these two great dictionaries, Protestant and Catholic respectively, will supply adequate information and ample references on most points. The Catholic Dictionary contains useful articles on most of the subjects here touched on; and an extensive Catholic Encyclopaedia is in course of preparation at the Catholic University of Washington. The habits and customs of the various orders are the subject of a book by Brevière, which abounds in plates, coloured, in the ed. of 1792. There are plates representing members of the chief orders in Dugdale’s Monasticon, and in the books of Gasquet and Steele mentioned above; also in Tuckey and Malleson, Handbook to Christian Orders, pt. iii. (1900). (E. C. B.)

MONASTIR, or BITOLJA, the second city of Macedonia, and the capital of the vilayet of Monastir in European Turkey, on the Salonica-Monastir railway, 400 m. W. of Constantineople. Pop. (1905), about 60,000. Monastir is situated at an altitude
MONAZITE—MONBODDO

of 200 ft. on the eastern versant of the richly wooded mountains which culminate in the Peristeri (8300 ft.) and seven Lake Prespa from the valley of the Kara-Su or Tserna. A tributary of this river, the Dragor or Drahor, traverses Monastir through a rocky channel which is rarely filled except after a thaw or heavy rain. The city possesses many mosques, churches and schools, baths and a military hospital. It is the seat of numerous consulates, an American Protestant mission, and a Lazarist mission. The annual value of its trade is about £600,000. Grain, flour, cloth, hides and bones are exported, and a large amount of gold and silver ornaments is manufactured, though this industry tends to decline.

The military advantages of its position at the meeting-place of roads from Salonica, Durazzo, Uskub, and Adrianople led the Turks, about 1820, to make Monastir the headquarters of an army corps. Since then the general and commercial importance of the city has greatly increased, and in 1858 it was made the see of a Bulgarian bishop. The ancient diocese of its Greek Archbishop is known as Pelagonia, from the old name of the Kara-Su Plain. Monastir itself has been identified with the ancient Heraclea Lyncestis on the Via Egnatia; its modern name is derived from the monastery of Bukova ("the beeches") near the south of the outskirts of the city.

MONAZITE, a mineral consisting of anhydrous phosphate of the cerium metals (Ce, La, Di)PO₄, together with small and variable amounts of thorium (ThO₂, 1-10%) and yttrium. It is of considerable commercial importance as a source of thorium for the manufacture of the Welsbach and other mantles for incandescent gas-lighting; the cerium is used to a limited extent in pharmacy.

The following analyses are of monazite from: (I.) Burke county, North Carolina; (II.) Arendal, Norway; (III.) Emmaville, Gough county, New South Wales.

Specific gravity | 99-63 | 100-60 | 99-49

Thorium and silica being often present in the monazite, it has been suggested that they exist as thorite (ThSiO₄) as a mechanical impurity in the monazite.

Crystals of monazite belong to the monoclinic system, and are usually flattened parallel to the ortho-pinacoid (a in the figure).

The large (up to 5 in. in length) reddish-brown, dull and opaque crystals from Norway and the Urals are simple in form, whilst the small, translucent, honey-yellow crystals from the Alps are bounded by numerous bright faces. Crystals of the latter habit were described in 1833 from Dauphiné under the name turnerite, and owing to their rarity were not until many years afterwards analysed chemically and proved to be identical with monazite. Monazite from the Urals was described by A. Breithaupt in 1839, and named by him from Gr. μονάζω (mo'nazw), to be solitary, because of the rarity of the singly occurring crystals. The hardness is 5-5, and the specific gravity 5-1-5-2. Light which has traversed a crystal or grain of monazite exhibits a characteristic absorption spectrum, and this affords a ready means of detecting the mineral.

As minute idiomorphic crystals monazite is of wide distribution in granites and gneisses, being present in very small amounts as an accessory constituent of these rocks. By powdering the rock and washing away the lighter minerals in a stream of water the heavy minerals (zircon, anatase, rutile, magnetite, garnet, monazite, xenotime, &c.) may be collected. This separation has been effected naturally by the weathering and disintegration of the rocks and the accumulation of the heavier minerals in the beds of streams; but other of these conditions monazite has been found as rounded water-worn pebbles in the alluvial or gold-washings of the Urals, Finland, Siberia, the United States, Brazil, Colombia, New South Wales, &c., and in tin-gravels in Swaziland, South Africa. Larger crystals of monazite are found embedded in pegmatite veins in the Ilmen Mountains (southern Urals); at Arendal and other places in southern Norway, where it is collected in the feldspar quarries to the extent of about one ton per annum; and in the mica mines at Villeneuve in Quebec, where masses of monazite weighing 20 lb. have been found. The small crystals of the "turnerite" habit occur implanted, often with anatase and rutile, on the crystallized quartz and albite, which line crevices in the crystalline schists of the French, Swiss and Tyrolean Alps; similar crystals with the same associations occur very exceptionally in the clay-slate at Tintagel in Cornwall. Microscopic crystals of monazite (cryptolite, from κρυπτός, concealed) have been observed embedded in the crystalline apatite of Arendal in Norway.

The deposits worked commercially are the monazite-bearing sands of North Carolina and Brazil, and to a smaller extent those of the Urals and Cornwall. These deposits occur as a wide area in the streams rising in the South Mountains, an eastern outlier of the Blue Ridge. The rocks of the district are granitic biotite- gneiss and hornblende-gneiss, and are intersected by veins of auriferous quartz. The placer gravels which contain the monazite vary from very small amounts up to 1 or 2%. The heavy minerals contained in the gravels are collected in the same manner as in washing for gold (which is often also present); magnetite is separated with the heavy minerals, but other minerals, such as zircon, rutile, garnet, corundum, &c., cannot be separated by mechanical means. The product is a fine-grained yellowish sand containing 65-85% of monazite and 3-5% of thorium. In Brazil it occurs in river-gravels and in the sand on the sea-beaches; an extensive accumulation of very rich monazite sand occurs on the seashore near Ilhaolga in Bahia, and this has been shipped as ballast in the natural state.

MONBODDO, JAMES BURNETT, LORD (1714-1799), Scottish judge and anthropologist, was born in 1714 at Monboddo in Kincardineshire. He studied at Aberdeen, and, after passing his law examinations in Edinburgh, he quickly took a leading position at the Scottish bar, being made a Lord of Session in 1767 with the title of Lord Monboddo. Many of his eccentrics, both of conduct and opinion, appear less remarkable to us than they did to his contemporaries; moreover, he seems to have heightened the reputation of his humorous sallies in their defence. He may have had other reasons than the practice of the ancients for dining late and performing his journeys on horseback instead of in a carriage. He is remembered more particularly for his writings on human origins. In his Antient Metaphysics (1779-1790), Monboddo conceived man as gradually elevating himself from an animal condition, in which his mind is immersed in matter, to a state in which mind acts independently of body. In his equally voluminous work, The Origin and Progress of Language (1773), he brought man under the same species as the orang-utan. He traced the gradual elevation of man to the social state, which he conceived as a natural process determined by "the necessities of human life." He looked on language (which is not "natural" to man in the sense of being necessary to his self-preservation) as a consequence of his social state. His views about the origin of society and language and the faculties by which man is distinguished from the brutes have many curious points of contact with Darwinism and neo-Kantianism. His idea of studying man as one of the animals, and of competing facts of human usage to throw light on the problems of civilization, bring him into contact with the one, and his intimate knowledge of Greek philosophy with the other. In both respects Monboddo was far in advance of his neighbours. His studied abstinence from fine writing—from "the rhetorical and poetical style fashionable among writers of the present day"—on such subjects as he handled confirmed the idea of his contemporaries that he was only an eccentric
concocter of supremely absurd paradoxes. He died on the 26th of May 1799.

Boswell's Life of Johnson gives an account of the lexicographer's visit to Burnett at Monboddo, and is full of references to the natural contemporary view of a man who thought that the human race could be descended from Monkeys.

MONCEY, BON ADRIEN JEANNOT DE, DUKE OF CONEGLIANO (1754-1842), marshal of France, was the son of a lawyer of Besançon, where he was born on the 31st of July 1754. In his boyhood he twice enlisted in the French army, but his father procured his discharge on both occasions. His desire was at last gratified in 1778, when he received a commission. He was a captain when, in 1791, he embraced the principles of the French Revolution. Moncey won great distinction in the campaigns of 1793 and 1794 on the Spanish frontier (see French Revolutionary Wars), rising from the command of a battalion to the command in chief of the Army of the Western Pyrénées in a few months, and his successful operations were largely instrumental in compelling the Spanish government to make peace. After this he was employed in the highest commands until 1799, when the government, suspecting him of Royalist views, dismissed him. But the coup d'état of 18 Brumaire brought him back to the active list, and in Napoleon's Italian campaign of 1800 he led a corps from Switzerland into Italy, surmounting all the difficulties of bringing horses and guns over the then formidable pass of St Gothard. In 1801 Napoleon made him inspector general of gendarmerie, and on the assumption of the imperial dignity he created him a marshal of France. In 1805 Moncey received the grand cordon of the legion of honour, and in 1808 the title of duke of Conegliano. In the latter year, the first of the Peninsular War, Moncey was sent to Spain in command of an army corps. He signalled himself by his victorious advance on Valencia, the effect of which was, however, destroyed by the disaster at Dupont at Baylen, and took a leading part in the emperor's campaign on the Ebro and in the second siege of Saragossa in 1809. He refused to serve in the invasion of Russia, and therefore had no share in the campaign of the grande armée in 1812 and 1813. When, however, France was invaded (1814) Marshal Moncey reappeared in the field and fought the last battle for Paris on the heights of Montmartre and at the barrier of Clichy. He remained neutral during the Hundred Days, feeling himself bound to Louis XVIII. by his engagements as a peer of France, but after Waterloo he was punished for refusing to take part in the court-martial on Ney by imprisonment and the loss of his marshal's baton. He was re-instituted in 1816, and re-entered the chamber of peers three years later. His last active service was as commander of an army corps in the short war with Spain, 1823. In 1833 he became governor of the Invalides. He died on the 20th of April 1842.

MONCHIQUE, a town of southern Portugal, in the district of Faro (formerly the province of Algarve); 13 m. S. of Sabola station on the Lisbon-Faro railway, and 12 m. N. of Villa Nova on the Atlantic. Pop. (1900), 7,345. Monchique is one of the principal Portuguese health-resorts, finely situated among the wooded heights of the Serra de Monchique, which rise on the west to 2,903 ft. There are hot sulphur springs, with baths and a sanatorium 4 m. south. Wheat, millet, rye, beans, oranges, wine, olive oil and chestnuts are the chief products, and there is a woollen factory.

MONTON, a city and port of entry in Westmoreland county, New Brunswick, Canada, 89 m. by rail N.E. of St John, the head of navigation on the Peticodiac river, the seat of workshops, general offices of the Inter-Colonial railway and the eastern terminus of the new Grand Trunk Pacific railway. Pop. (1901), 9026. It has large stove factories, engine and boiler works, and is a flourishing manufacturing town. The workshops of the railway and great part of the town were swept away by fire in February 1906, but have been rebuilt on a larger and more modern scale.

MOND, LUDWIG (1839-1900), British chemist, was born at Cassel in Germany on the 7th of March 1839. After studying at Marburg under Hermann Kolbe and at Heidelberg under Robert Bunsen, he came to England in 1862 and obtained a position in a chemical works at Widnes, where he elaborated the practical application of a method he had devised for recovering the sulphur lost as calcium sulphide in the black ash waste of the Leblanc alkali process. He became a naturalized British subject in 1867. In 1873 he entered into partnership with Sir John Tomlinson Brunner (b. 1824), whom he had met when he was at Widnes, and thus founded the great chemical manufacturing firm of Brunner, Mond & Co. They began to make alkali by the ammonia-soda process, under licence from the Belgian chemist, Ernest Solvay, but at first the venture threatened to prove a failure. Gradually, however, the technical difficulties were overcome and success assured, largely as a result of improved methods worked out by Mond for the recovery of the ammonia. About 1879 he began experiments in the economical utilization of fuel, and his efforts led him to the system of making producer-gas, known by his name (see GAS: II. For Fuel and Power). Later, while attempting to utilize the gas for the production of electricity by means of a Grove gas battery, he noticed that the carbon monoxide contained in it combined with nickel. The resulting compound, nickel carbonyl, which was described to the Chemical Society in 1890, is both formed and decomposed within a very moderate range of temperature, and on this fact he based a successful process for the extraction of nickel from its ores. A liberal contributor to the purposes of scientific research, Mond founded in 1896 the Davy-Faraday Research Laboratory in connection with the Royal Institution. On his death, which occurred in London on the 11th of December 1900, he bequeathed a large part of his collection of pictures to the nation.

MONDAY (in O.E. Monandæg, the moon's day, a translation of the Late Lat. Lunae dies, from which the French lundi is taken), the second day of the week (see CALENDAR). The day has been humorously canonized as St Monday, the festival of cobbler's, who seldom work on Mondays, and were supposed not to know exactly on which day St Crispin's (their patron saint) festival fell, save that it should be a Monday, and thus celebrated each Monday in the year as a holiday so as to be certain to honour the day. In some parts of Yorkshire any holiday is called Cobbler's Monday. Collop Monday, in the north of England, is the Monday before Shrove Tuesday, so called in allusion to the dish of fried eggs and bacon, and slices of salted, dried meat, called collops, taken on that day preparatory to the fast. Plough Monday in England is the Monday after Twelfth Day, the first Monday after Epiphany, in allusion to the fact that in medieval times the ploughmen had their fête-day and went around the villages begging plough-money. The lord mayor of London holds a Grand Court of Wardmote at the Guildhall on Plough Monday of each year, to receive returns from the wards of the election of common councilmen and to hear petitions against such returns.

MONDOÑEDO, a city of northern Spain, in the province of Lugo, 27 m. N.N.E. of the city of Lugo, on the river Masma. Pop. (1900), 10,590. Mondóñedo occupies a sheltered valley among the northern outliers of the Cantabrian Mountains. The principal buildings are the cathedral, a Corinthian structure of the 17th century, an ex-convent of Franciscan friars of Alcântara, which is used for a theatre and a public school, and the civil hospital. The industries include lace-making, linen-weaving, and leather manufacture.

According to local tradition, the bishopric of Dumium, near Burgos, was transferred to San Martín de Mondóñedo (10 m. from Mondóñedo) in the 8th century; it was brought to Mondóñedo itself in the beginning of the 12th century. After having been for nearly a century and a half in the hands of the Moors, Mondóñedo was recaptured by Ordoño I. in 858; and the Christian possession was made permanent by Alfonso III. in 870. It was taken by surprise by the French in 899.

MONDOVI, a town and episcopal see of the province of Cuneo, Piedmont, Italy, 17 m. by rail E. of Cuneo. Pop. (1901), 5,379 (town); 18,982 (commune). The lower town is 128 ft.
above sea-level, the upper 1834 ft. There is a school of the industrial arts and handicrafts, and majolica, paper, and silk cocoons are produced. The upper town contains the hexagonal piazza, a citadel, erected in 1573 by Emanuel Philibert, the cathedral of St. Donatus, a spacious episcopal palace, and higher up is a tower, the Belvedere, with a fine view. At the foot of the hill along the banks of the Ellero (a tributary of the Po) lie the industrial and commercial suburbs of Breo, Borgatto, Pian della Valle and Carassone, with their potteries, tanneries, paper-mills, marble-works, &c. The mansion of Count San Quintino in Pian della Valle was the seat of the printing-press which from 1472 issued books with the imprint Mons Regalis.

Monte—Mons Vici, Mons Regalis, Montecargie—did not take its rise till about A.D. 1000. The bishopric dates from 1388. About 2 m. to the east is the sanctuary of Vico, a church designed by Ascanio Vittozzi in 1596 and crowned by a famous dome (1730-1748), which has been declared a national monument. In the square before it is a monument (1891) to Charles Emmanuel I. of Savoy.

Mone, Claude (1840-1924). French painter, was born in Paris on the 14th of November 1840. His youth was passed at Havre, where his father had settled in 1845. Until he was fifteen years old he led a somewhat irregular life, learning little at school, and spending all his time in decorating his books with drawings and caricatures which gave him notoriety in Havre. At the same time he became acquainted with Boudin, a clever sea-painter, under whose guidance he learned to love and to understand nature. At the age of twenty he became a soldier, and spent two years of his military time with the regiment of the Chasseurs d’Afrique in the desert. Falling ill with fever, he was sent home, and entered the studio of Gleyre. This classical painter tried in vain to keep him to conventional art and away from truth and nature, and Monet left his studio, where he had become acquainted with two other “impressionistic” painters—Sisley and Renoir. At that time he also knew Manet (q.v.), and in 1869 he joined the group of Cézanne, Degas, Duranty, Sisley, and became a plein air painter. During the war of 1870 he withdrew to England, and on his return was introduced by Daubigny to a dealer, M. Durand-Ruel, in whose galleries almost all his works have been exhibited. In 1872 he exhibited views of Argenteuil, near Paris; in 1874 a series entitled ‘Cathedrals,’ showing the cathedral of Rouen under different lights. He afterwards painted views of Vétheuil (1875, see Plate), Pourville and cliffs of Etretat (1881), of Bordighera (1886), of the Creuse (1885), Le Meules (1891), and some further views of cathedrals (1894). In December 1900 he exhibited some pictures called “Le Bassin des Nymphées,” and was engaged at the beginning of 1901 in painting views of London. Several of Monet’s paintings, bequeathed by M. Callotte, are in the Luxembourg Museum, Paris. (See IMPRESSIONISM.)

MONETARY CONFERENCES (International). These assemblies were one of the features of the latter half of the 19th century, and, with the accommodating tendency of the times, were by concerted international action. The disorganized state of the European currencies, which became more serious in consequence of the great expansion in trade and industry, came into notice through the great gold discoveries and their effect on the relations between the precious metals. Both by its situation and its currency system, France was the country that was first led to aim at the establishment of a currency union, in which French ideas and influences would be predominant. A preliminary step was the formation of the Latin union, whereby the currencies of France, Italy, Belgium and Switzerland were in respect to their gold and silver coins—assimilated. In 1867 the Paris Exhibition furnished the occasion for summoning a monetary conference, to which the principal countries of the world sent representatives. The guiding spirit of this assembly was the eminent economist, De Parié, who had originated the Latin Union. By his advice a scheme was approved recommending the adoption of the single gold standard, the use of the decimal system, and the co-ordination of the various currencies with the French system. Difficulties as to the mode of bringing these principles into practical operation were discussed, and full liberty to each to be given to the several nations to carry out the proposals in the way that seemed best. The result proved that the obstacles were insurmountable, e.g., the British government could not obtain the assent of a Royal Commission to the assimilation of the sovereign to the 25-franc piece; and the course of political events soon completely altered the relative position of the leading countries, even in their monetary relations. Germany and the United States reformed their currencies, without reference to any international considerations.

The meeting of the next international conference took place under very different conditions. A great fall in the value of silver as measured in gold, in progress from 1873, had affected the relations of silver-using countries, and disturbed the level of prices. Indian interests as well as those of American producers of silver suffered, while the management of all double-standard currencies became a task of increasing difficulty. The government of the United States invited the representatives of the leading powers to meet in Paris for the purpose of considering (1) the desirability of introducing the use of silver for coinage, (2) the adoption of international bimetallism (q.v.), by the acceptance of a ratio to be fixed by agreement. Eleven nations sent delegates, Germany being the only great power unrepresented. After somewhat protracted discussion and the presentation of a large number of documents the European states accepted the American proposition “that it is necessary to maintain in the world the monetary functions of silver”; but declined to bind the discretion of particular states as to the methods to be employed. They further declared it impossible to enter into an agreement for a common ratio. The conference, therefore, separated without any result being obtained.

In consequence of the continuing fall in the value of silver, which stimulated the bimetallic agitation, a third conference was convened by the joint action of France and the United States; it also met in Paris, and was more influential than its predecessor, since it sent representatives, as did Spain, Portugal, Denmark and India. The characteristic of this conference was the greater strength of the support given to the bimetallist proposal by France and the United States, together with the opposition of the delegates of the smaller European countries, and the refusal of Germany to promise any co-operation. The inevitable consequence of this situation was the adjournment of the conference to obtain fresh instructions, which, however, were never furnished.

After several abortive attempts the fourth (and last) of the conferences of this class was brought together at Brussels in November 1892 on the initiative of the United States. A full representation of the powers attended, but delay arose from the absence of definite proposals by the American government. These, when they were presented, proved to be only a reaffirmation of the bimetallist policy, and showed no advance. The conference, therefore, proceeded to consider the plans of Levy, Baron de Rothschild and Sotheber for the more extended use of silver. Such proposals, though merely alleviations, failed to gain any effective support. Appeals to England and Germany to grant some concessions likewise failed. Thus, like its Paris forerunners, the Brussels conference adjourned, but never resumed its sittings.

After 1892 the currency problem passed into a new stage, in which action was national rather than international. The method of procedure by conference was for the time abandoned.

The proceedings of the several conferences have been issued by the governments taking part in them. Those of the United States are the most convenient for English and American readers. See M. B. Russell, International Monetary Conferences (New York, 1898).

MONEY. 1. Definition and Functions.—The difficult question as to the best definition of money has been complicated by the efforts of writers so to define the term as to give support to their particular theories. It is hard to frame a precise account which
MONEY

The quantity theory of money holds that the value of money is determined by the quantity of money in circulation. This theory is based on the idea that the value of money is inversely related to the quantity of money in circulation. The more money there is in circulation, the lower its value will be, and vice versa. The quantity theory is often expressed in the equation of exchange, which states that the quantity of money in circulation multiplied by its value is equal to the quantity of goods and services produced in the economy.

The quantity theory of money is important because it helps to explain how changes in the money supply can affect the overall economy. An increase in the money supply can lead to inflation, while a decrease in the money supply can lead to deflation. The theory is also important for central banks, which use changes in the money supply to control inflation and stabilize the economy.

The quantity theory of money is not without its critics, however. Some argue that it is too simplistic and does not take into account other factors that can affect the value of money, such as changes in technology or shifts in consumer behavior. Others argue that the theory does not consider the role of central banks in managing the money supply. Despite these criticisms, the quantity theory remains a important and influential theory in macroeconomics.
MONEY

trade and expanding business are causes which operate not only to raise but to lower prices; for by enlarging the work that money has to do they raise its value, i.e. provided that other things remain the same. Another more obvious deduction is that a large addition to the stock of money does not necessarily raise prices, since money is only effective when brought into circulation.

The chief topic of dispute in respect to the theory of money-value has been concerned with the question as to the ultimate regulating influence. The value of freely produced commodities is—according to economic theory—determined by "cost of production," or, where the article is produced at different costs, by the cost of production under the most unfavourable circumstances. As demand varies with price, it follows that an adjustment of value takes place through the interaction of cost and demand, the latter indicating the influence of the utility of the commodity on the quantity required. In applying the theory to the special case of money, the first consideration is the fact that gold and silver, the principal money materials, are the products of mines, and are perhaps at different times to such extent that their values depend on the portions raised at greatest cost. We thus obtain the proposition that has figured in so many textbooks; viz. that "the value of money depends on its cost of production." The theory of normal value, however, involves certain assumptions, which are significant in this connexion. Competition is conceived as absolutely free; it is assumed that there are accurate data for computing costs, and that the determination of value by cost is effective only "in the long run." It is recognized, also, that cost operates on value through its power in regulating supply. "The latent influence," says Mill, "by which the value of things are made to conform in the long run to the cost of production is the variation that would otherwise take place in the supply of the commodity." From such considerations it follows that the influence of cost on the value of money is not so predominant as a rigid interpretation of the theory would seem to suggest. Earlier times it had been a common proceeding on the part of governments to restrict or stimulate both mining for the precious metals and the business of coinage. At all times the working of gold and silver mines has been rather a hazardous speculation than the production of a material of general utility. The pure metal, as such, is a totally different thing from, say, a new mine in Peru," says Adams Smith, "he is universally looked upon as a man destined to bankruptcy and ruin, and is upon that account shunned and avoided by everybody. Mining, it seems, is a business of such wide spread that, in the long run, the profits do not compensate the blanks." The modern capitalist organization of gold mining has not done much to alter this condition. As regards the adjustment of supply to meet an altered cost of production, one difficulty remains. The actual supply of money is so large, when compared with the annual production of the precious metals, that a change in output can operate but slowly on its value. The total stoppage of fresh supplies from foreign sources is a rare event. This is paper money, not immediately redeemable and increased production is more rapid in its operation, it takes some time to produce a decided effect. Hence the conclusion is reached that "the effects of all changes in the conditions of production of precious metals are at first, and continue to be for many years, questions of quantity only, with little reference to cost of production." This is the position which is usually known as that of the "quantity" theory; though very different degrees of doctrine and language are employed. Any opinion which suggests that the "quantity" theory may be taken as the prevalent theory. At all events, it is beyond dispute that the cost of production is not for short periods the controlling force which governs the value of money; when we remember for long periods its influence is very hard to ascertain, in consequence of the speculative nature of the industries of gold and silver mining. Another peculiar feature of the problem of money value arises from the fact that it is only through an actual change in the supply of money that its "theory can be altered with" theory that they can be produced at lower cost will bring about a reduction in their value. In the case of money, this does not hold. There must be an adjustment of the amount, or of the efficiency, of the money stock, since, as explained above, it is the constant and supply of money which influences the value of money. Its value is established in the very process of carrying on exchanges, and that process is influenced by the available supply. In regard to another form of money the effect of the amount in existence is still more decisive. This is paper money, not immediately redeemable and in coin. In this case the idea of cost is manifestly inapplicable; the quantity in circulation is evidently, as proved by abundant experience, the ruling influence on value. In fact, the "quantity" theory receives its simplest illustration in the case of inconvertible paper. The truth that the theory is but an instance of the action of supply and demand is equally shown by this prominent class of instances. Where metallic coinage is artificially limited the same result holds good. The value of such currencies plainly depends on the conditions of supply and demand.

The immense growth of credit and its embodiment in instruments that can be used as substitutes for money has led to the promulgation of a view respecting the value of money which may be called the "credit" theory. According to the upholders of this doctrine, the actual amount of metallic money has but a trifling effect on the range of prices, and therefore on the value of money. What is really important is the volume of credit instruments in circulation. It is on their amount that price movements depend. Gold has become only the small change of the wholesale markets, and its quantity is comparatively unimportant as a determinant of prices. The theory has some connexion with the view of "money" as consisting in the loanable capital of the market, taking shape in the cheques that transfer liabilities. Thus the rate of interest comes to form a factor in the creation of "money," and the mercantile use of the term "value" receives a justification. Like the pure "cost" theory of money values, the credit theory receives too one-sided a view of the facts. In particular, it fails to recognize the ultimate dependence of all kinds of credit on the stock of money in the full sense, i.e. on metallic legal-tender money. The truths adumbrated in the theory are better expressed in the statement of the quantity theory in its developed form, as set forth above. It is necessary to take into account the varying quantities of the precious metals, the modes of use in respect to them; the influence of cost of production, and the way in which credit expedites replace standard money. A complete theory must include all these elements, while not unduly emphasizing any one of them.

At the beginning of statistical inquiry much attention was given to the question: What quantity of money does a country require for the proper working of its industrial system? Petty and Locke were ready to give definite answers; but modern inquirers decline making any quantitative statement, and content themselves with indicating the conditions to be considered. Amongst these are: Population, amount of transactions, the efficiency of money, the development of credit, and the height to which banking organization has attained. Other elements in the problem are the disposition towards hoarding, and the employment of some form of barter in transactions. The contrast between India and the United States in monetary and industrial habits supplies an effective series of illustrations on this matter. The conclusion is obvious that economic progress is accompanied by a more sparing use of money. The most important aspect of the question in modern times is in relation to the division of money between countries. Regarded from this point of view, the quantity of money that a country needs is that which will keep its prices in due level with those of the countries with which it has commercial relations. For, this is the condition of equilibrium; there would otherwise be an excess of either exports or imports, involving a transfer of money to adjust the balance. It may be added that the organization works automatically, since fluctuations in the stock of money are corrected by the action of trade. The best estimates place the gold circulation of the United Kingdom at somewhat under £1,000,000,000, the token currency at about £15,000,000, and the note circulation as nearly £43,000,000. The French use of metallic money is much larger; probably over £2,000,000,000, and the note circulation is also over £200,000,000.

3. Early Forms of Currency.—Up to the present we have considered money as being fully established and properly adapted to fulfil its various functions. We have now to trace the steps by which a suitable system of currency was evolved from a state of barter. It is important for a right understanding of the question to grasp the fact that exchanges took place originally between groups, and not between individuals. The slow growth of exchanges is thus explained, as each group produced most of the articles necessary for itself, and such acts of barter as took
they do not come under the preceding head, furnish another class. Thus salt was used in Abyssinia and Mexico; while the metals—a phenomenon which will require a more careful examination—have succeeded in finally driving all their inferior competitors out of the field, and have become the sole substances for money.

4. The Metals as Money. Reasons for their Adoption. Superiority of Silver and Gold.—The employment of metals as money material can be traced far back in the history of civilization; but as it is impossible to determine the exact order of their appearance in this capacity, it will be convenient to take them in the order of their value, beginning with the lowest—Iron—to judge from the statement of Aristotle—was widely used as currency. One remarkable instance is the Spartan money, which was clearly a survival of a form that had died out among the other Greek states; though it has often been attributed to ascetic policy. In conjunction with copper, iron formed one of the constituents of early Chinese currency, and at a later time was used as a subsidiary coinage in Japan. Iron spikes are used as money in Central Africa, while Adam Smith notes the employment of nails for the same purpose in Scotland. Lead has served as money, e.g. in Burma. The use of copper as money has been more extensive than is the case in respect to the metals just mentioned. It, as stated, was used in China along with iron—an early instance of bimetallism—and it figured in the first Hebrew coins. It was the sole Roman coinage down to 269 B.C. and it has lingered on to a comparatively recent date in the backward European currencies. It even survives as a remnant of the token coinage. Tin has not been a favourite material for money: the richness of the Cornish mines accounts for its use by some British kings. Silver holds a more prominent place than any of the preceding metals. Down to the close of the 18th century it was the chief form of money, and often looked on as forming the necessary standard substance. It was the principal Greek money material, and was introduced at Rome in 269 B.C. The currencies of medieval Europe had silver as their leading constituent; while down almost to the present day Eastern countries seemed to prefer silver to gold.

The pre-eminence of gold as money is now beyond dispute; there, is, however, some difficulty in discovering its earliest employment. It is, perhaps, to be found in 

"the pictures of the ancient Egyptians weighing in scales heaps of rings of gold and silver." According to W. Ridgeway's ingenious theory gold comes into use as a currency in due equation to the older cattle-unit, the ox. It was certainly employed by the great Eastern monarchs; its further development will be considered later on. Metals of modern discovery—such as nickel and platinum—are used to-day by the fanciers of new governments, though the former makes a good token coinage.

The preceding examination of the varied materials of currency, metallic and non-metallic, suggests some conclusions respecting the course of monetary evolution, viz.: (1) that the metals tend to supersede all other forms of money among progressive communities, and (2) that the more valuable metals displace the less valuable ones. The explanation of these movements is found in the qualities that are especially desirable in the articles used for money. There has been a long process of selection and elimination in the course of monetary history.

First, it is plain that nothing can serve as money which has not the attributes of wealth; i.e. unless it is useful, transferable and limited in supply. As these conditions are essential to the existence of value, the instrument for measuring and transferring values must possess them. A second requisite of great effect is the amount of value in proportion to weight or mass. High value in small bulk gives the quality of portability, want of which has been a fatal obstacle to the continued use of many forms of money. Silver and gold, though expensive, were durable in this quality, and so were iron and copper. Sheep and oxen, though technically described as "self-moving," are expensive to transport from place to place. That the material of money shall be the same throughout, so that one unit shall be equal in value to another, is a further desideratum, which is as decidedly lacking in cattle-currency as it is prominent in the metals. It is, further, desirable that the substance used as money shall be
Coinage systems have had a long period of growth, in which two distinct stages can be noted. In the first only the quality or fineness of the metal is denoted by the stamp, no attempt being made to fix the weight. The stamp, so to speak, acts as a kind of hallmark. The coins of gold employed by the Chinese may have been of the same nature as the earliest coins. Modern authorities accept the view of Herodotus that gold and silver coins were first used by the Lydians; the same author mentions that the first Greek coinage was at Aegina by Phaidon of Argos. In order to complete the invention it became necessary to determine the quantity of gold or silver in each coin as its fineness. A further result was the establishment of a regular shape for the purpose of preventing any tampering with the coin after its manufacture. Though various experiments in form were made by the different states and by the different metals, the universally accepted shape came to be that of a flat circle, each side of which is stamped, as also in many cases the edge. The great number of the Greek city states afforded ample opportunities for the coiners to make their coins by different systems, but in the end the only system of securing good currencies was made. The improvement in the Greek coinages may be regarded as the consequence, and in some degree a cause, of their growing commerce.

From Greece the art of coinage was introduced into Italy by the Hellenic settlers and traders, and became one of the essential features of a civilized society. Progress, however, did not stop with the establishment of the institution of coined money. A number of practical questions were to be decided, among which was the obtaining of overcoming the difficulties that certain technical problems presented. This, despite of early experience, it has at times been suggested that the circular form might be replaced by some other, e.g. the square or oblong. This has confirmed the wisdom of the old-established shape. Another necessity was to provide a measure for the most suitable for coins. Here the lower limit is prescribed by the convenience of the users. Coins that are easily lost, or picked up with trouble, such as the British threepenny piece and the American half-cent, are less likely to be used by the people than thick, round, and notched denarii. The upper limit presents greater difficulties. Very large pieces are hard to coin, and they give facilities for improper treatment by drilling holes and filling them up with cheaper metal, or even for the whole coinage of the metal. The only satisfactory solution of this problem is to attach a small, or even large, ornament to the coin.

From the foregoing examination of the requisites desirable in the material of money it is easy to deduce the empirical laws which the history of money discloses, since metals, as compared with non-metallic substances, evidently possess those requisites in a great degree. They are all durable, homogeneous, divisible and recognizable, and in virtue of these superior advantages they are the only substances now used for money by advanced nations. Nor is the case different when made to be divided between the different metals. Iron has been rejected because of its low value and its liability to rust, lead from its extreme softness, and tin from its tendency to break. All these metals, as well as copper, are unsuitable from their low value, which hinders their speedy transmission so as to adjust inequalities of local prices.

The substitution of the cheaper metals leaves silver and gold as the only suitable materials for forming the principal currency. Of late years there has been a very decided movement towards the adoption of the latter as the sole monetary standard, silver being regarded as suitable only for a subsidiary coinage. The special features of gold and silver which render them the most suitable materials for currency may here be noted. "The value of these metals changes only by slow degrees; they are readily divisible into any number of parts which may be reunited by means of fusion without loss; they do not deteriorate by being kept; their firm and compact texture makes them difficult to wear; their production, especially of gold, is so considerable that they possess great value in small bulk, and can of course be transported with comparative facility; and their identity is perfect." The possession by both these metals of all the qualities needed in money is more briefly but forcibly put by Cantillon when he says that "gold and silver alone are of small volume, of equal goodness, easy of transport, divisible without loss, easily guarded, thus presenting an almost too rare property." This view has even been pushed to an extreme form in the proposition of Turgot, that they became universal money by the force and power of things, independently of all convention and law, from which the deduction has been drawn that to proscribe silver by law from being used as money is a violation of the nature of things.

5. The Introduction and Development of Coinage. The State and Money.—The earliest metallic currencies passed by weight; they were, in fact, commodities, though used in a special way. The Hebrew records, as well as the Greek writers, bear witness to the prevalence of this primitive system. Thus, Aristotle, after explaining the circumstances that led to the invention of money, points out how it was at first defined simply by size and weight, although finally men went further and set a stamp on every coin to relieve them from the trouble of weighing it." (Pol. 1, 9, 8.)
private persons often exercised the privilege of coining. The very large number of the autonomous cities of Greece, which possessed the right of issuing money, was the cause of the competition between different currencies, each having legal tender power only within its own city. In its practical outcome this "free coining" system proved beneficial, for it compelled the maintenance of a true standard in order to gain wider circulation. With the establishment of later states the control over the issue of money grew more stringent. In the later Roman Empire the right of coining was reserved to the Emperor alone. The exclusion of the private from the traditions of prerogative passed on to the medieval kings, a right carefully guarded by the English sovereigns. In France and Germany the principal nobles claimed this seigniorial right, but in the modern states representative governments have been definitely vested in the supreme authority, i.e., the sovereign.

One reason for the close connexion of money with the state is the fact that there is one attribute of currency which comes within the area of work specially allotted to the public authority. Money ought to have the power finally to close a transaction, i.e., to say it should be "legal tender." This "liberating power," as the French call it, might be regarded as one of the money functions. Those who look on money as a purely legal institution naturally take this view; it seems, however, better to take the economic conditions as the really fundamental ones. It is only on account of their economic effects that legal regulations require consideration. These effects are, indeed, very far-reaching. By prescribing the standard of value, by fixing the exchange between different substances to be used as money, and by their frequent interferences with existing currencies, the governments of the world have guided—
as well as very often disturbed—the normal course of development. What Aristotle regarded as coining, is now attributed to state intervention. But it is important to remember that the sphere of governmental action in respect to money is limited. A currency system is never an arbitrary creation; it must grow slowly out of the habits and customs of the economic, and of the legal, as well as of the moral and political topography of a nation. Sudden change at the caprice of the state is likely to continue. Further, it is clear that no government can determine the results of its interference; these will depend on the existing conditions and will conform to economic law. The movement of coin is an exogenous force which cannot be subjected to a direct action by the state. The only legitimate action of the state is to prevent the errors and of the disasters that have followed on the ill-advised measures of public authority.

One result of the close connexion of the state with the business of coinage has been the establishment of regulations in reference to the expense of the process. As coins are manufactured articles it seems evident that a charge sufficient to cover the cost may rightly be imposed. Such a charge is described by the term Seigniorage (§ 6). It has in many countries been tantamount to the elaboration of coined coin, but it amounts to a depreciation of the currency; for the levy of a charge on coining is the same as the substitution of so much metal from the coins issued. English policy is peculiar in its adoption of gratuitous coinage of gold, an anomaly which is determined by the exigencies of the time. Silver trines, but defended on the ground of the convenience to trade, from the equivalent of gold bullion and coin. The heavy seigniorage on the silver coins—at present over 60%—is a source of considerable anxiety. At the same time, however, several countries levy moderate charges on their gold coins, and make profit on their silver issues, though in different ways. As it has become the duty of the state to maintain the currency in a sound condition, it has to deal with the question of its expense. This is composed of several elements viz. (1) the cost of manufacture, just mentioned; (2) the loss through the wear which money undergoes in the course of circulating; and (3) the interest on the capital sunk in the monetary stock. A general inquiry into the question of ((§ 6)) the interest which that amount of capital would produce by investment, i.e., at 4% £4,000,000. The expense is amply justified by the services that a good currency renders; but, at the same time, it proves the desirability of any economy the state can contrive. The practically all the handling agency is the use of representative money and the various forms of credit, in which so much of the latest advances consist.

6. Representative Money: Its Introduction and Development. The Mode in which Credit is used as Money.—Economy in the employment of the precious metals is naturally suggested by ordinary experience; but the way in which states have profited by the expedient of depreciation affords a special inducement to follow what is practically the same course, and issue paper documents in place of the monied cost of maintaining a metallic circulation. The idea explained by paper currency is one in which the whole value has been appropriated as seigniorage. The cost of keeping a stock of valuable money is obviated, and the new instrument of exchange is supported by state authority. Here the action of economic conditions is instructively illustrated; for though a government can set up a paper currency, it is not within its power to prescribe its value. The quantity theory (§ 6) is confirmed by the inevitable decline in value when issue passes a definite point. The only effective mode of preventing depreciation is by limiting the amount of paper money to that of the metallic money previously in circulation. The easiest way to accomplish this is to leave the use of the paper currency optional by making it convertible into coin at the will of the holder. The amount of the circulation is thus automatically fixed by the action of the community. An evident disadvantage is the necessity of keeping an adequate reserve of coin to meet actual and prospective demands. For ideal security the whole amount of paper should be covered by an equal value of metal. In practice the reserve may be much smaller; but so far as it is required, it means a deduction from the gain of issue. The temptation to reduce the reserve to an inadequate amount and then to escape the difficulty by resorting to the expedient of refusing to pay coin for notes, i.e., making the notes convertible, has proved too strong for nearly all governments at times of pressure. The history of state dealings with paper money may broadly be described as a history of inconvertibility. Hard-bought experience has only now forced on the notice of governments the loss that follows from a disturbance of the standard used in ordinary payments. They are evident to all careful observers, and may be concisely summarized as consisting in: (1) the creation of fictitious credits; (2) a depreciation of metallic currency; (3) the pressure on the working classes from the slower rise of money wages, in contrast with the quicker movement of the prices of commodities, resulting in a fall of real wages; and (4) the checks to dealings in relation with the international money market, due to the risk of exchange fluctuations. The only gains are the temporary stimulus to certain branches of trade, and the advantage to the state by contracting a forced loan without paying interest.

The origin of paper money by state direction is the easiest to consider and explain. It does not follow that it is the most important or the earliest kind of representative currency. As W. Bagehot has pointed out, the real origin of economic institutions is often very different from the apparent one. In truth, representative money seems to have grown up out of the elementary contrivances of early credit. A claim could be expressed and transferred by a document, which might be used for facilitating exchanges. The rigid formalism of early law hindered the extensive use of this convenient machinery. It was not till the invention of bond-notes that easy confidence was gained. Thus the bank-note comes into use, resting, not on the fiat of the state, but on the repute of the issuer. At this stage the history of the two distinct forms of representative money becomes mixed, owing to the control exercised over banks by government and to the fact that banking companies were in many cases the agents by which what was virtually state money was issued. There is, however, the fundamental difference that bank money finds its way into use through the ordinary system of granting credit; while government money is used in the purchase of commodities and the hire of services. The former, therefore, returns in a short time; the latter remains in circulation and displaces metallic currency. In the long controversy over the Bank Charter Act 1844 this distinction was brought into prominence. Since that date the extraordinary development of deposit banking in both Great Britain and the United States has furnished these countries with by far the most flexible form of currency yet known in the cheques that transfer claims on the capital held by the banking institutions. The confusion so often shown regarding the relation of credit to money is confounded by checking the latter. When it is remembered that in its origin money is only an instrument to facilitate exchange —we might even say to render it possible—it follows that from its earliest to its latest form the ruling influence is the need of society for the best mechanism of exchange.

7. Production and Consumption of the Precious Metals in their Economic Aspects.—In considering various monetary questions it is essential to have some acquaintance with the economic
aspects of the production of gold and silver. The first point to which attention may be directed is the field over which production extends. At one time or other these two metals have been found in every continent. Asia Minor in early times possessed its goldfields, or rather auriferous sands. Ceylon also undoubtedly contained gold-mines. China and India both produced silver to a considerable extent. Egyptian remains show that gold was commonly known in that country, probably procured from Nubia and Abyssinia. On the opposite side of Africa, too, the name of Gold Coast shows that metal was thence exported. The mines of Laurium in Attica were a source of supply to the Athenians, and were worked as a state monopoly. At an earlier date the Babylonian and Assyrian empires had each accumulated large stores of gold. The Phoenician importations of gold from the Red Sea coasts (Ophir) are known from Scripture. The Persian kings from the time of Darius levied tribute on all their provinces—in gold from India, in silver from the remaining districts, the larger part of which was stored up in the royal treasuries. This tendency of despotic rulers to accumulate treasure had all through ancient history important effects on the economic structure of society. At present it is quite natural to assume that the metals, produced by the miners of many nations, were widely distributed, and tend to keep at an equal level all the world over—an assumption which is in general well grounded, though an important exception exists. Ancient history presents a widely different set of forces in operation. Gold and silver were produced by slaves under the pressure of fear, and were drawn towards the ruling parts of the great empires; in a word, war, not commerce, was the distributing agency. From this condition of affairs it is easy to see that, whatever may be the reasons for assigning to cost of production a potent influence over the value of money in modern times (and grounds have been already advanced for the belief that its influence has been exaggerated), no such reasons then existed. The production of the precious metals was carried on in similar manner to the great buildings and other works of those periods, on non-economic grounds, and therefore produced quite different effects. The whole history of the Persian monarchy to its overthrow by Alexander (330 B.C.) shows that the hoarded mass of the precious metals continued constantly to increase. On the capture of Persépolis by the Grecian army an enormous treasure was found there, some estimates placing it as high as 120,000 talents of gold and silver (£27,600,000). All the temples, too, were receptacles for the precious metals, so that the stock accumulated at about 300 B.C. must have been very great. The only causes which tended to diminish the store were the losses arising from wars, when the various treasuries were liable to be plundered and their contents dispersed. There was therefore a more unequal distribution of the material of money than at present. The growth of the Roman dominion led to important results, since under their rule the Spanish mines were developed and became a leading source of supply. The great masses of treasure set towards Rome, so that it became the monetary centre of the world. The overthrow of the republican government and the peace which followed also affected the conditions of production. The inefficiency of the Roman administration made it advantageous to let out the mines to farmers, who worked them in a wasteful and improvident manner, while the supply of slaves was reduced, thus depriving the lessees of their principal agency for carrying on production. The result was a continuous decline in the store of money. W. Jacob has made an attempt to estimate the amount at the death of Augustus (A.D. 14), and arrives at the conclusion that it was £53,800,000. (Precious Metals, i. 225.) Without placing much value on this necessarily conjectural estimate, it is safe to assume that this period marked the highest point of accumulation.

The succeeding centuries exhibit a steady decline, though it is of course impossible to attach any value to even the most carefully guarded numerical estimates. The phenomenon which has since so often attracted notice—the drain of the precious metals to the East—began at this time, and was a subject of complaint by the Roman writers, while the stock of gold and silver being thrown into general circulation suffered from abrasion, and was more likely to be lost than when stored up in the royal treasure-houses and temples. These causes tended to depress the scale of prices, while the barbarian invasions produced a strong effect on the supply by drawing off the mining population and damaging the various enterprises used for working the mines. The conjectural estimate is that about A.D. 800 the total supply had been reduced to £33,000,000 (or about one-twelfth of what it had been at the death of Augustus). A new period in the history of gold and silver production may be fixed at this date. The Moors, now firmly established in Spain, began to reopen the mines in that country which had been allowed to fall into disuse. Other European mines also were opened, notably those of Saxony and the Harz Mountains, as well as the Austrian mines—the chief medieval sources of supply. The international system of currency, based on the pound of silver as a unit, which was introduced by Charlemagne, must have tended to economize the wear of the metals. We may therefore conclude that from this date (A.D. 800) the supply was sufficient to counteract the loss by wear and exportation, and accordingly remained more or less stationary up to 1492, when there was a new change in the conditions of production, which was the result of the discovery of America. Though 1492 is the date of the first landing, yet for some time no important additions were made to the supply of money. The conquest of Mexico (1519) gave opportunities of working the silver-mines of that country, while the first mines of Chile and Peru were almost simultaneously discovered, and in 1545 those of Potosí were laid open. From this latter date we may regard the American supply as an influential factor in causing a continuous increase in the stock of money. The annual addition to the store of money has been estimated as £2,100,000 for the period from 1545 to 1600. At this date the Brazilian supply began. The course of distribution of these fresh masses of the precious metals deserves some notice. The flow of the new supplies was first towards Spain and Portugal, whence they passed to the larger commercial centres of the other European countries, the effect being that prices were raised in and about the chief towns, while the value of money in the country districts remained unaltered. The additions to the supply of precious metals in the year 1600 and later years continued to be very considerable; but, if Adam Smith's view be correct, the full effect on prices was produced by 1640, and the increased amount of money was from that time counterbalanced by the wider extension of trade. At the commencement of the 17th century the annual production of gold had been estimated as being from £2,500,000 to £3,000,000. The year 1689 seems to mark an epoch in the production of these metals, since the outbreak of the revolts of the various Spanish dependencies in South America tended to check the usual supply from those countries, and a marked increase in the value of money was the consequence. During the period 1800-1849 the value of gold and silver rose to about two and a half times its former level, notwithstanding fresh discoveries in Asiatic Russia, which became considerable from 1823. The annual yield in 1849 was estimated at £8,000,000. The next important date for our present purpose is the year 1848, when the Californian mines were opened, while in 1851 the Australian discoveries took place. By these events an enormous mass of gold was added to the world's supply. The most careful estimates fix the addition during the years 1851-1871 at £15,000,000, or an amount nearly equal to the former stock in existence. The problems raised by this phenomenon have received careful study. The main features of interest may be briefly summed up. (1) The additional supply was almost entirely of gold, thus tending to produce a distinction between the two principal monetary metals and an alteration in the currency of bimetallic countries. Under this influence France, from being a silver-using, became a gold-using country. (2) The contemporaneous development of the continental railway systems, and the partial adoption of free trade, with the consequent facilities for freer circulation of commodities, led to the course of distribution.
being different from that of the 16th century. The more back-
ward districts were the principal gainers, and a more general
externalization of prices combined with a slight elevation in value with
the exception of silver. The new supply of gold increased the
possibility of a general currency reform possible, and made the use of a gold
monometallic standard appear feasible. The movements for
currency reform, as will be seen, all arose after these discoveries.

(4) The change in the value of money, which may for the period
1840-1869 be fixed at 20%, enabled a general increase of
wages to be carried out, thus improving the condition of the classes
living on manual labour. It may be added that the
difficulty of tracing the effects of this great addition to the money
stock is a most striking proof of the complexity of modern economic development. (5) The last point to be noticed is the
very small influence exercised on the value of silver by the
new gold. The gold price of silver in London rose only from
59½d. per oz. to 62½d. per oz.—i.e. between 4 and 5%. Hardly
had the gold discoveries of 1848-1851 ceased to produce a
decided effect when new silver mines of unusual fertility came
into working. During the period immediately succeeding the
old discoveries the production of silver remained at an annual
amount of £8,000,000 to £9,000,000. This amount, however,
about £6,000,000, and remained at that amount for the next five years. More than half of the supply
came from new mines opened in Nevada. This increased
supply was accompanied by a marked depreciation in the gold
price of silver, though the prices of commodities in countries
having a silver standard did not rise. The disturbances resulting
from the combined effect of the new silver and the diminution in
the annual output of gold which began about 1870 and
continued for nearly twenty years were the cause of much contro-
versy and led to the propounding of novel monetary theories.

Bi-metalism came into prominence; and the modes of relieving
trade depression caused by the fall in prices were keenly discussed.

Before any monetary adjustment took place the situation
again changed in consequence of a renewal of the Australian
gold production, soon followed by the great gold discoveries
in South Africa. The annual output of gold, which had fallen
below 20,000,000, in 1883 rose rapidly to 260,000,000, and in
1908 reached the prodigious figure of 500,000,000 with the
advent of the Boer War. By this sudden change in the output of gold,
the difficulties that had led to the agitations for "free
silver" in the United States, and for "international bimeta-
lism" in Europe and in India were removed, showing the close
connexion between the production of the precious metals and
the economic, especially the monetary, policy of all periods.

The modes of consumption of the precious metals—under which
their use is included—are of equal importance with those of their
production. Classed roughly, they come under three heads, viz.
(1) their use as merchandise, (2) their use as money, (3) the "drain" to
the production of the precious metals. If the demand for these metals is not available, it may be said with some confidence that the demand
for personal use would, if society had made some progress, to
decline in strength. The desire for adornment is not a keen one
with modern civilized peoples; and, so far as it exists, is gratified in
other ways than by using silver or gold. For purposes of manu-
facture their use is large and increasing. The second head is that
which we are principally concerned. It is evidently connected with
the value and the financial and monetary organization, including in
the latter the banking system. Currency requirements still form the
largest portion of the demand for the precious metals. Under the
third head a remarkable exception to the tendency towards the
centralization of the precious metals appears. For, during the
two thousand years the movement of silver from west to east has
been noticed. Humboldt has made the ingenious remark that the
course of these metals is in the opposite direction to that of civiliza-
tion and of commerce. The chief Prussian, and later the
chief Eastern products used in Europe were luxuries, such as silk and
spices, and silver was sent from Europe to pay for them. Eastern trade increased, owing to the discovery of the passage round the Cape of Good Hope, and the flow of silver became greater.

Special circumstances have from time to time influenced the move-
ment. Thus, the new supplies of gold in the middle of the last
century caused by their action on the bi-metallic currencies of
Europe. The United States has also undergone change; the tendency to fix prices on a customary basis is bound to yield to the pressure of competition. The inev-
itable result will be to make the price level alter with each influx
and efflux of precious metal, and thereby to limit the demand for bullion through the action of the exchanges.

One of the technical features of the production of the precious
metals should be noted, in consequence of its economic effect.
Gold has more frequently been found near the surface; silver is
more commonly contained in rock. This difference in the distribution of the two metals has a striking effect on the output of the two
metals; and the amount of the former metal produced depends more on accidental circum-
stances, in contrast to that of silver, which is affected by the standard
of mining skill. The mines of Nevada were exceptional in their
output of both metals; and in nearly equal values. The gold-
mining districts of South Africa have come to be worked at deep levels and therefore
are technically in the same class as silver mines. In fact, there is a pronounced tendency all the world over towards the system of
calling up stopes for the high grade and leaving the muck at great
depths. During the last quarter of a century gold has been recovered by this system in an amount exceeding that which had been recovered by the old methods of mining.

Money theory requires to be elucidated by the constant
reference to history; just as in turn the history of currency
has to be interpreted by the aid of general principles. Each
country has its peculiar problems, which call for special treatment; though at the same time there is no way of avoiding
the operation of those economic conditions and forces that are
to be found in all countries. The first decisive fact that emerges
from the vast material presented by the history of money is the tendency at most periods towards deterioration.

In the time of purely metallic currency debasement is the most
serious danger; when representative money has come into being
everyone is a paper currency. Dangers are multiplied by the elaboration of the paper currency systems. Expert
knowledge has more effect in the later than in the earlier
deriods. The crude expedients of the Tudors would not be
tolerated in modern England. There is much fuller
recognition of the danger of over-issue in paper money; and this
is accompanied by greater care in the treatment of credit
institutions in their relation to the modern media of circulation. It
is also noteworthy that mere popular agitation has lost a great
deal of its power, as shown in the failure of both the "soft
money" and the "free silver" movements in the United States. On the other hand the tendency to accept scientific
methods is illustrated in the treatment of the Indian currency
question.

Greek Currencies.—As already noticed the political conditions
of Greek life supplied a varied field for monetary experiments.
Unfortunately the details are very incompletely known, and the subject of Hellenic money has not been sufficiently studied from the
economic side. Certain broad facts are prominent. The Athenian
monetary system was based on silver, and the current coin was the silver drachma, coupled with the later employment of gold to serve for the high class coins or currency. The diversity of the coinage is a characteristic feature. The alteration of the standard by Solon
appears in the light of an exceptional revolutionary expedient.

It amounted to the creation of a new standard unit—the Attic
drachma—of a fixed value in the coinage of Athens. This honesty in respect to the monetary standard seems
to have been observed in the Greek states. Some despotisms,
such as that of Caria, kept their coins at a fixed standard for many
centuries. The use of silver and gold in an amalgam, known as electrion, was an admissible device; it, however, had the evil effect of suggesting
the use of poorer alloys.

Roman Coins.—The history of money in Rome is rather different.

Beginning with copper, the currency was changed into a double
standard by the introduction of silver (269 B.C.). Gold came
in for commercial use with the extension of the Roman dominions, and
copper was reduced to a token coinage. In the stress of the Punic Wars debasement was one of the financial devices of the magistrates.

The conquest of the Greek territories brought about the regulation
of their currencies. Silver was prescribed as the money substance. The establishment of the empire led to the definite concentration of the right of coining in the sovereign; though concessions were made in various localities, where the smaller coinages were allowed to continue, the power of the smaller coinage was only temporary. The Empire is due to the remarkable way in which it illustrates the tendency of despotic and bureaucratic rule to lower the condition of good administration. A long course of debasement is the characteristic consequence of the concentration of the coinage in the hands of the government, as we are told, "the history of the silver coinage is one of melancholy debasement. The most extensive frauds in connexion with money were perpetrated by the Romans." The gold aureus, which in the time of Augustus was one-twelfth of a pound, was bore in the time of Constantine only one seventy-second of a pound. The alloy in the silver coins gradually rose to three-fourths of the weight. Plated coins came into extensive use. The practice of debasement was in accordance with the theories of the jurists, who seem to have regarded money as simply the currency of the state, i.e. the personal ruler.

Medieval Money.—After the overthrow of the Western Empire, throns the issue was in the condition of what had been called "natural economy," the state in which money has not come into being, they soon were disposed to carry on the Roman tradition, and their rulers adopted some form of silver currency. With the temporary organization of feudalism, there was given the effort to found a general standard money on the basis of the silver pound. From this new starting-point it is possible to trace the course of some of the leading currency systems of Europe. For purposes of illustration it will be found useful to distinguish three periods of the English monetary system: (1) the medieval crown (franc) in France, which are typical of the general course of monetary development. The systems of these countries are moreover remarkable (1) in the contrasts that they present to each other, and (2) in the widespread influence that they have exercised on later national monetary systems.

English Monetary History.—The English currency begins with the pound of silver (troy weight) as the standard unit, subdivided into 20 shillings, each containing 12 pence. The first in use was the silver penny system, in force before the Conquest, is the direct descendant of the Carlingvian, and it continued without change until about 1276, when a slight deprecation was introduced by coining the pound into 24 pennies, increasing the value of the shilling. This was followed, generally in the direction of lowering the weight of the coin. Two periods are remarkable for the operation of this tendency, viz: (1) the reign of Edward I., when the silver was debased by 21% in 1279, and that of Edward VI., 1543-1552. In this short space of ten years the expedient of degrading the quality of the coinage by bringing the alloy up to three-fourths of the mass was practised for the first time in English history. The substitution then of the gold pound troy for the Tower pound in 1527 was accompanied by a lowering in weight which far exceeded the gain from the higher value of the new pound (3700 instead of 3500 grains). The result was the sale of the gold coinage as a commodity, and the definite settlement in 1601 on the basis of coining 62 shillings from the pound troy also deserve mention. Turning to the gold currency, we find some gold pennies issued in 1257, probably in imitation of the example, followed by a good deal of gold coin before the middle of the century; but after the disaster of the eastern trade and the example of the Greek Empire, which had always retained its gold currency. The regular series of English gold coins begins in 1343, when Edward III. ordered the coinage of florins—the "noble" soon followed. The "sovereign" was first issued in 1489. But gold was treated as a commercial money, to be used as subsidiary to the standard silver. Its value was therefore varied from time to time to meet the difficulty that local bimetallism was certain to cause, in consequence of the undervaluing of one of the other metals. During the 17th century the most noticeable events are: the proposals for depreciation, of which the most remarkable was that of Charles I. (1624); the introduction of the guinea as the leading gold coin, and the frequent readjustment of the values of the two metals by proclamation. The great recoilage of 1696, caused by the silver bullion decline after the Restoration, which Locke remarks, represented the starting of the silver currency. In the 18th century the establishment of the guinea at 21s. by Newton's advice made the adoption of gold as the standard inevitable, since it was overvalued in an appreciable degree. The gold and silver standards were adopted as defined by Adam Smith (1776) and is regarded as settled by Ricardo (1809). The full legal establishment of the present metallic currency took place in 1816, when the guinea was fixed at the legal value of 1 guinea = £1.3.6. (1723-1747 grs. standard fineness), and the English currency system has been described as a "composite standard," to the level of a token coinage, being slightly lowered by the coinage of the pound of silver into 66 shillings. Thus, by a course of development extending over 700 years, the English currency has been transformed from a crude silver standard system into one resting on gold, but employing both silver and representative money for the greater part of the actual work.

French Money: its Development.—Though the monetary system of Charlemagne soon disappeared in Germany and Italy, it con-

continued in the part of his empire that became France. The extreme confusion of the time of his successors enabled the feudal lords to claim the right of coinage. No less than 150 seigniorage are said to have exercised this power at the accession of the first Capet. With the development of the peace and the economic activities, the coinage was restricted, in order to reserve to the Crown the profitable right of seigniorage. Unfortunately the legitimate profit from this source was not sufficient to satisfy the wants of the royal treasury. The discovery of easier and less suspicious ways of debasement, extending from the time of Philip I. to that of Louis XIV. (1600-1774). In sharp contrast to English policy, the tampering with the currency was persistent, so that both Louis IX. was forced to do away with the four-shilling piece. This was followed by degradations which were imposed, until the royal mint was always appealed to as the equitable standard for the observance of his successors. Yet, in his time the livre had been debased to less than one-fourth of its primitive level. The Henry III. introduced the livre de Milles, the livre de six sous, a coin of four sous, of which the existence was continued. After the accession of Louis XI. (1461) the livre had been brought down to one-fifteenth of its original value. The 16th century is equally an age of debasement, no less than nineteen occurring between 1497 and 1602. Again, in the reign of Louis XI., the absolute monarchy continued the process of debasing the standard under Louis XIV., and the livre was only one-half what it had been under Henri IV. At the Revolution the decline had proceeded so far that the livre de Milles, which was worth at least two sous at the time of the Ancien Regime, was reduced to the value of one.

MONEY

The consideration of the history of currency systems naturally suggests the general problems that the more advanced countries have had to encounter. Of these, some may be described as formal, i.e. they relate to the arrangement and the definition of coinage and standards. Others are in essence issues of principle involving the most complicated theoretical doctrines, on which there is even yet sharp differences of opinion between competent students of economics. In some instances an intermediate class may be found, e.g. the question of subdivision of the coins does raise some difficult matters of application; though it does not constitute a basic question of definition, it is not a question of small importance.

But the distinction is a valid one. Whether a country should adopt the "gold standard" or prefer a "bimetallic" standard is obviously very different from the elementary points about units and the different classes of coins. We will therefore begin by noticing some of the characteristics that are found in all modern currencies and some of which are implied in the idea of money. Thus it is true that every currency system must be based on a standard unit of value which consists of a "fixed quantity of some concrete substance defined by reference to the units of weight or space." The English unit, for example, is the pound, which consists of a definite quantity of gold (123:27447 grs. standard fineness) while the French unit is the franc (composed of 5 grammes of silver nine-tenths fine). It is not necessary, though it is usually the case, that there shall be a coin corresponding to the standard unit, all that is needed is that the current coins shall be multiples or submultiples of the base, or the least easily reducible to it. The Portuguese reis is too small to be coined, and the pound of silver that formed the unit of the
MONEY 703

early English and French currencies was too large. Quite
distinct from both the actual coins and the unit of value is the
money of account, though in practice it is usually identical with
one of them. In Russia in early times the copper coinage of
monetary money of account not coin but the copper copeck was
the unit of weight. Connected with the distinction between
these two is the highly important one between standard and
token money, the former being of full power for
discharging debts, and in the case of most systems only of
equal value to the metal out of which it is made, while the latter
is rated at a nominal value higher than that of its material.
The silver and copper coinage in England and the smaller coins
in the Latin union are only tokens; in the case of English silver
coins, the cost value is less than 40% of the nominal one. The
French tokens are made of inferior fineness (835 per 1000) to
the full tender silver. Two restrictions are applied to token
issues: (1) they are only legally available to discharge small
debts—in England silver is limited to the payment of 4s.;
(2) they can be coined only by the permission of the state. Thus
in England the Bank of England is the state agent for the silver
coinage. The limitations are evidently required to prevent the
expulsion of standard money, and to avoid the flooding of the
circulation with coinage that is not needed for the purposes of
the limited exchanges to which it is applicable. The older English
system represented so many grades in the subdivision of value.
All other currencies have the same need for divisions.
The simplest scale would be called the "binary," in which each
coin is half the value of the next higher. It is, however, not
likely to be found. Many systems have series of coins on the
binary scale. The penny, the halfpenny, the farthing; the 4s.
piece, the florin, the shilling, the sixpence, the threepence; at a
higher level the sovereign, the half-sovereign, the crown are
the half-crown, and the crown, and the pound, and the specie.

Another part of the structure of any currency is the scale on
which its accounts, and by consequence the degrees of its coins,
corresponds. The most important factor in determining
the circulation amongst all classes of people is the relative
value of the different kinds of currency. In modern times the
English system represented so many grades in the subdivision of
value. All other currencies have the same need for divisions.
The simplest scale would be called the "binary," in which each
coin is half the value of the next higher. It is, however, not
likely to be found. Many systems have series of coins on the
binary scale. The penny, the halfpenny, the farthing; the 4s.
piece, the florin, the shilling, the sixpence, the threepence; at a
higher level the sovereign, the half-sovereign, the crown are
the half-crown, and the crown, and the pound, and the specie.

The currency systems that have been the most successful
have all been based on a bimetallic standard. This system was
first introduced in China, where the silver and gold coins were
of the same value. The advantage of this system is that it
prevents the depreciation of either metal by allowing them to
be used interchangeably. However, the problem of deciding
which metal is currently more valuable arises. In the case
of bimetallism, the government intervenes by setting a
particular weight or a certain number of coins as the
standard. One of the disadvantages of this system is the
cost of maintaining the necessary exchanges and decisions.

The more recent system, the gold standard, was introduced
in the late 19th century. In this system, the value of each
currency is tied to the value of gold. The advantage of this
system is that it provides a stable value for each currency,
even in times of economic downturns. The disadvantage is
that the government must hold enough gold reserves to
back up the currency, which can be a costly process.

In summary, the choice of currency system depends on a
country's economic situation, political stability, and
international relations. The gold standard was favored
in countries with strong economies, while the bimetallism
system was more common in countries with weaker
economies. The choice of currency system affects the
economy's stability and the value of its currency, which
in turn affects its international trade and economic
development.
MONEY

Better forms have come into being as social progress has become more pronounced; and further improvement may be expected in the future. The multiplicity of things when money is coming into being is characterized by the weighing or measuring of the substances used for aiding the course of exchanges. It has therefore been called the system of "currency by weight." In strictness, it is better regarded as the stage before the introduction of real money; and thus outside the field of currency systems proper. The simplest system of currency seems to be that in which the state coins ingest of different metals and allows them to circulate without assigning any ratio for their respective values. Such an inconvenient form is not likely to be of long continuance; but it has sometimes arisen at a later time through the introduction of foreign coinages. Holland at the end of the 16th century, Turkey down to the present day may be given as countries approaching this state. The title of "currency by tale" is Jevons's apt denomination for such a currency system. The next form in logical order is that in which a single metal is definitely appointed as the sole standard money. In early ages this is the most natural arrangement, and it has, therefore, been widely adopted. Silver has been the metal, generally used, as the impulse of the general tendency (§ 8) proves. The title of "single legal tender" system is the obvious one for this form. With the growth of transactions a difficulty soon presents itself. If the chosen metal is not of high value it is cumbrous for making large payments; if on the other hand its value is high, it is unsuitable for use in small transactions. Hence there almost inevitably follows the use of other metals, which are better suited for certain particular uses. Thus silver is at once too heavy and too light. To pay £1000 in silver at its present value would take 800 lb troy, while a silver penny would be under the convenient limit of size. Partly for these reasons, but also to a large extent through the persistence of currency by tale, we find that along with the standard money other kinds are brought into or retained in use. Copper long survives beside silver; and gold is employed for the more important commercial transactions. Public convenience leads to the valuation of these subsidiary forms of money, and in this easy manner another currency system—that of "multiple legal tender"—comes into being. Though, theoretically, several substances might be valued for use as money, in practice some kind of bimetallism is used, and generally gold and silver are the constituents of the system. Thus for over three centuries England had a currency in which the values of gold and silver were fixed from time to time by royal proclamation. France and the United States, as well as many other countries, have had long experience of national bimetallism. The great problem in such a form of currency has always been that of keeping the two metals in effective circulation. As the values of the precious metals fluctuate, the principle of Gresham's Law is exemplified by the expulsion of the undervalued one. Each change in the conditions of production or in the ratios fixed by other countries tends to disturb the balance and is harassing to trade. Local or national bimetallism comes to be unsustainable, and is replaced by other currency types. The most remarkable is that known as the "composite legal tender" system. Its object is to combine any advantages of the single legal tender with the main tendency of the gold-exchange system. One metal is selected as the standard and is legal tender to any amount; other metals are utilized for the purpose of token currency. Thus in the system of the United Kingdom gold is the only standard coinage; but silver and copper are employed for the lower coins and for smaller payments. The establishment of this ingenious arrangement is rather the outcome of the circumstances that governed the English monetary situation in the 18th century than any refined considerations of theory; but its justification on grounds of principle is furnished in Lord Liverpool's "Coins of the Realm" (1803). The extent to which the system has been copied by other nations and the stability of the English currency are strong confirmations of its merits as a solution of currency difficulties. Though the composite legal tender system has been a decided success, it does not follow that it supplies the only mode of dealing with the troubles that attend on the use of the local double standard. Other methods have been evolved from the monetary experiences of France and India, which take distinct forms according to the special features of the case. There is the currency system known as the "limping standard," the essence of which is the concurrent use of two metals, one being overvalued and coined only by state authority. The quantity of this favoured metal is necessarily limited in amount, to avoid depreciation or the ejection of the other metal from the circulation. It, however, has the position of money in the fullest sense, in that it is legal tender for any amount. The s-franc pieces issued by the Latin union are the best known specimen of such coinage. In this case also the origin of the system was not theoretical, it was the result of the fall in the value of silver and the fear entertained by the French government that gold would be displaced by the cheaper metal. The temporary expedient of limiting the coinage of standard silver has developed into the maintenance during more than thirty-five years of the limping standard, which derives its name from the shortness of one limb of the currency body. Equally remarkable for monetary theory is another plan, which is usually described as the "gold-exchange" system, in which the ordinary currency is of a metal coined only by the state, and so limited as to keep in a prescribed value ratio to another metal (gold) which does not circulate, but acts as the standard of value. This variation on the limping standard has been produced by the effort of the Indian government to meet the embarrassment caused by the continuous fall in the gold value of silver. Under the pressure of failing revenue and of persons suffering from the rupee depreciation in gold, the limitation on silver coinage was first enacted (1803); to be followed some years later (1899) by the establishment of gold as the standard, with a definite parity assigned for the state silver issues. The success of the Indian experiment—for such it avowedly was—has led to its imitation by the American administration in the Philippine Islands and by Mexico. It may be looked on as the natural product of the condition in which the single legal tender system is proving unfit, while the material changes in the composite legal tender system is wanting. The employment and theoretic explanation of these methods of currency adjustment mark the greatest advance made in monetary science and practice in recent years. Whether the limping, or the gold-exchange standards will be permanent forms is difficult to determine; but they are beyond doubt of much importance in meeting the risks of a period of transition. In any case they are entitled to recognition as distinct forms of currency organization, resting on a scientific basis.

The types presented by purely metallic currencies can be considered by themselves for the purpose of theoretical exposition. In actual working they are now affected by the existence of representative money. The state issues paper money which may be either convertible or inconvertible, or if it refrains from so doing, the banks take up the task and supply a medium of exchange in the form of notes, or by a later development through providing for the use of cheques by their customers. An inconvertible paper currency has some pronounced affinities with overvalued metal; a duly regulated issue of this kind is quite on the lines of the gold-exchange system, and the difficulties of the two forms are very similar. But, just as the cruder systems of metallic money have gradually given way to the higher ones, so it may be said that the grosser forms of mismanagement in representative money are being removed, notwithstanding the recurrence of such monetary crises as that of 1907 in the United States. The great instance of government paper money is the United States notes, known, as "greenbacks," which are fixed at the amount of $346,681,016. The most prominent case of bank issue of notes is that of the Bank of France, with somewhat over $200,000,000 in circulation. Examples of the cheque currency are more difficult to state in quantitative shape; as the constituent parts are continually being created and cancelled, but the clearing-house returns give some idea of its extent in England. The figure for 1909 was
It appears to be the outcome of these discussions. The first established conclusion is the impossibility of obtaining an absolute and invariable standard. The best that can be hoped is a near approximation by balancing the elements of fluctuation. The construction of the most suitable monetary system is a work of practical adjustment. The influence of the actual conditions, which has been already emphasized, helps to indicate the limits of profitable inquiry. In respect to the metallic basis of choice is between the single standard—gold or silver, and some combination of these. The single standard of silver can be set aside, though it has had influential supporters. On the other hand the only combinations that need be considered are those indicated above by the titles "bimetallism" and "symmetallism.

The theory of the gold standard rests on the principle that one metal is a better criterion for measuring values than two, since the fluctuations that occur by the substitution of one metal for the other are certain to be disturbing. There is the further difficulty that no ratio can be permanently fixed between two metals, as their values must vary with the alterations in production. The inherent simplicity, and, so to speak, "naturalness," of the single standard is best realized by embodying it in gold, which is universally recognized, of high cost and yet found in sufficient amount to discharge the money work of the standard. The verdict of history is appealed to as confirming the theoretical presumption, for gold has been gaining ground from century to century, and its advantages in the process have only been more pronounced (see MONETARY CONFERENCES). Most of the objections to the gold standard rest on ideas which are the support of other economic fallacies. The attempt to impose upon a nation the restraint of the rule of economic law. The foundation of the doctrine of "bimetallism" is the theory that the value of money is determined, not simply by cost of production, nor by unregulated supply and demand, but by the action of regulated demand, in conjunction with the actual conditions of production. States are the demanders of gold for monetary use, and by adjusting that demand they can powerfully influence the course of production, especially as the cost at which either

The experiment of paper money in various forms, which has not yet been completely closed. But the tendency in the last fifty years has been to concentrate attention on the meaning and due constitution of the monetary standard. In particular, the difficulties that result from an alteration in general prices, and the inconvenience to foreign trade from different currency standards have been exhaustively considered. It is therefore desirable to present in a concise form what

\[ \text{MONEY} \]
gold or silver is obtained varies with the productiveness of the poorest mine in working. Thus by directing consumption, states are controlling production, and therefore within limits—fixing the relative value of the two metals. This power has been shown in the stability of the ratio during the continuance of the French standard (1863-73).

The possibility of maintaining a given ratio being thus established, the argument proceeds to show the advantages of the system. (i.) It secures the concurrent use of the precious metals and avoids throwing all the money work on gold.

(ii.) Greater stability in value may be expected, since the fluctuations of either metal will be compensated by those of the other. At the worst the variation can only be as great. (iii.) The larger stock of money tends to keep up prices to the benefit of trade; for falling prices dampen production. And the fixed ratio, it is a stable pair of exchange between silver-using and gold-using countries; though universal bimetallism would remove this distinction. (v.) The establishment of a world-currency would be facilitated by allowing both metals a well-defined relation. This enumeration of the heads of the "bimetallist" case shows that its working depends on the area of its operation. It must be "international" and the states composing the union must be "great powers" in the monetary sense. Otherwise, their action would be comparatively ineffective. The crucial difficulty has been the determination of the common ratio. The risk of failure in carrying out the policy has proved a deterrent to such great powers as England and Germany, who are in possession of the gold standard. On the theoretic side the chief weakness of bimetallism has been its failure to supply any clear account of the limits within which states can regulate the ratio of gold to silver. If the ratio 15:1 can be set up why should not the ratio 100:1, or that of equality? Its practical failure has resulted partly from political conditions, partly from the removal of most of the difficulties which it was

* Inconvertible paper currency.

1 Present system introduced in 1864, in place of the system adopted in 1870. The Maria Theresa dollar is only used as a commercial money in Levantine trade.

2 The system of the Scandinavian union came into force on the 1st of January 1875. It is based on gold monometallism.

3 The coinage system of France came into force on the 6th of May 1799. It was extended to the countries forming the Latin union in 1865; it has been adopted by Greece, Rumania, Servia and Spain. It is the most widely accepted in Europe today. The Austrian 8 and 4 golden pieces were equivalent to the 20 and 10 franc pieces. In 1879 it was estimated that the system was used by populations amounting to 18,000,000. In its origin a double standard (gold: silver ratio of 15:1) it became the limping standard by the limitation of the silver coinage. The unit is the same value all through the union, but receives different names in different countries. The titles are: in France, Belgium and Switzerland, franc and centime; in Italy, lire and centesimi; in Greece, drachme and lepta; in Rumania, lei and bani; in Servia, dinar and para; in Spain, peseta and centimos.

4 The German coinage law came into force on the 1st of January 1875. It was modelled on the English system, but it is only in the last few years that the old silver has been completely withdrawn.

5 The Dutch standard has been changed more than once. In 1847 a silver standard was introduced, and retained till 1872, the unit being the silver guider. In 1875 the free coinage of gold was decreed; silver coinage having been restricted since 1872. Thus the limping standard is in force.

6 The nominal standard of Portugal is gold. The English sovereign is equal tender at 416 reis.

7 The Russian currency until 1897 was nominally a silver standard one; but really it was inconvertible. The currency was improved in 1885; and in 1897 the gold standard was adopted, proviso being made for the withdrawal of the paper money. Finland, which had a currency on the French model, is now being compelled to accept the Russian currency.

8 The Spanish coinage was assimilated to that of the Latin union in 1871. Spain, differing from the other countries of the group, coins a 25 peseta piece.

9 The Medjidie coinage was introduced in 1844. English sovereigns circulate at 125 piastres; 20 franc pieces at 100 piastres.
intended to meet by the subsequent economic development. The proposal for a joint standard formed by using a unit in which the two metals are combined has the advantage of escaping the risk of failure to maintain the ratio, for it makes the employment of both silver and gold essential. Its influence in causing stability is also likely to be greater; but it is open to the danger that a shortage of one metal would not be compensated by the abundance of the other. The further advantage that it does not need international agreement (for each country could settle its own combination) is counterbalanced by the strangeness of the plan and by its necessitating the use of representative money. The suggestion of "gold" coins on the model of the Greek electrum would hardly be acceptable.

11. The Present Money Systems of the World: Changes of the last Half Century.—The facts as to the money of the leading countries of the world are given in Tables II. and III. It is, however, necessary to explain the way in which this position has been reached by the reforms of the last fifty years. Since 1860 the alterations in standards and in coin denominations have been of a very extensive nature. England is one of the

**Notes:**

1. Until 1906 there was no mint in Canada. English and American coins circulate. The standard is gold (£1 = 4.866 dollars). There were formerly different methods of counting, viz. English sterling, Halifax currency and Canadian sterling; the respective ratios being 100 : 120 : 108.

2. The Mexican currency has been entirely altered in its standard by the legislation of 1905. The gold-exchange system has been brought into force. The old-established dollar, which is called peso, is reduced so as to represent a ratio of about 33:1.

3. The dollar was introduced in 1872 as the unit. In 1872 the ratio of gold to silver was fixed at 1 to 15. This valuation undergraded gold, consequently silver became the standard. In 1834 the ratio was altered to 1 to 16, and it was again changed in 1837.

4. The silver standard is prescribed in India in 1835, with the use of the gold mohurs. The latter was demonetized in 1853.

5. The Brazilian currency is greatly depreciated. It is derived from the Portuguese.

6. The Chilean coinage was reformed in 1895, when the gold standard was adopted, and the system brought into relation to the English one. Two Chilean Conders (20 peso pieces) being equal to £1.

7. In 1904 Colombia adopted the gold standard by taking the equivalent of the U.S. dollar as the unit; but the inconvertible paper is the main currency; and the old coins pass as commercial money.

8. After attempting a parity with the Latin union, and passing through a period of inconvertible paper, Peru has adopted the English gold standard and coinage, but keeps her own silver denominations.

9. The silver standard was prescribed in India in 1835, with the use of the gold mohurs. The latter was demonetized in 1853.

10. The old Japanese currency consisted of gold kobangs and silver itazkus, with a ratio of 4 to 1. This antique system was replaced in 1871 by a double-standard one on the French plan, the ratio being 16:17:11. The system passed first into one of silver monometalism; and then became one of inconvertible paper.

The great reform of 1897, aided by the Chinese War indemnity, placed the currency on the gold basis.

---

**Inconvertible paper currency.**
few countries that has not found change desirable. France has
reorganized her token coins (1864), entered into the Latin
union (1865) and adopted the liping standard in 1879. Russia
has been transformed from a bimetallist system hitherto
existing in the German States (1873). The Scandinavian
union has been set up (1875). Holland has changed her system
more than once. Still later, Austria-Hungary (1892) and
Russia (1897) have come over from the silver standard with the
practical use of convertible paper to new currencies on the gold basis.
In America the United States, after a series of monetary ex-
periences, has made the gold dollar its standard unit, though
the silver complication still exists. Mexico has succeeded in
establishing a gold-exchange standard at such a ratio as to induce
the export of gold. British India has had its rupee currency
put into relation to the English gold unit, and has been followed
by the Straits Settlements. Japan first abandoned its ancient
currency (1871). It then adopted a double standard system
which became in practice a silver one and later passed into
inconvertible paper. Finally, it has (1897) established a composite
legal tender system on the gold basis. The Dutch Indies have
the gold-exchange standard on the same plan as British India.
In the Krugerrand gold states of South Africa the points
resembling the currencies of less advanced countries may be
indicated. Though there is a tendency to establish the money
of the mother-country in colonies, some of the British possessions,
acting on their own initiative, have kept their own currency system.
There has been a widespread movement in the backward countries
of the world towards reforming their money; chiefly by setting up
some line of connection with the gold standard. In South and
Central America the silver standard has been retained as the
medium for co-ordination with the French system has ceased.
The English standard has been preferred as a model by Chile
and Peru. In Asia the currency of the Philippines has been reorganized
under American control. China is considering monetary reform
and is testing the effect of connection with the gold-exchange
system. Probably the most defective currencies are now those
of Turkey and her tributary states.

BIBLIOGRAPHY.—The literature on the subject of money has been
worked over with almost mercilessness. The list of writers who
have contributed to it begins with Aristotle, and includes such
famous names as Copernicus, Locke and Newton. A full enumera-
tion would fill a volume of no slight size. All that can be done here
is to give a short classified list of the most serviceable books.

I. Economic text-books: English and American.—J. S. Mill,
Principles of Political Economy (London, 1848; new ed. by Ashley,
1909); Sidgwick, Principles of Political Economy (London, 1885;
3d ed., 1922); H. M. Johnson, Political Economy (London, 1888;
3d ed., 1922); M. E. Atkinson, Political Economy (London, 1897;
2d ed., 1922); F. A. Walker, Political Economy (London, 1897;
2d ed., 1899; 3d ed., 1901); F. A. Walker, Political Economy
(New York, 1893; 2d ed., 1897, often reprinted); A. T. Hadley,
Economics (New York, 1891); E. R. A. Seligman, Principles of Eco-
nomics (New York, 1897; 2d ed., 1907); M. R. Noble, Economic
Principles (New York, 1904; 3d ed., 1908); French: M. Chevalier,
Cours d'économie politique (vol. i. “La Monnaie,” Paris, 1856); P. Leroy-
Beaulieu, Traité d'économie politique (4 vols., Paris, 1866); C. Gide,
Cours d'économie politique (Paris, 1900); German: H. Mangoldt,
Grundzüge der Volkswirtschaftslehre (2d ed., Stuttgart, 1871); G.
Schonberg, Handbuch der politischen Oekonomie (Tübingen,
1882; 4th ed., 1904); G. Schmoller, Grundriss der allgemeinen
Volkswirtschaftslehre (Leipzig, 1900-1905). The Dutch work by
N. G. Pierson has been translated into English with the title

II. Special treatises on “Money” :—W. S. Jevons, Money
and the Mechanism of Exchange (London, 1875); F. A. Walker, Money
and the Mechanism of Exchange (London, 1878); H. M. Johnson, Money
and Banking (2 vols., London, 1905); A. Arnaune, La Monnaie,
le crédit et le change (Paris, 1894; 2d ed., 1902); A. de Poville, La
Monnaie (Paris, 1895); K. Knapp, Kurs der Wert Münzen in
österreich (1873-1875); G. F. Knapp, Staatliche Theorie der Geldes
(Leipzig, 1895).

III. Works on special questions: See Bimetallism; Banking;
and Monetary Conferences for writings on the problems of the stand-
ard or the gold standard, the mismeasure of the French currency
Monnaie dans l'antiquité (Paris, 1876); W. A. Shaw, History of
Currency, 1252-1824 (London, 1895). For the history of the English
currency, besides the works on the numismatic side—Lord Liverpool,
Coins and Note Issues, 1809-1830, reprint edition (London, 1873);
Technical details in Tate’s Cambridge (many editions).

MONEY-LENDING, the lending of money on usury (q.v.).
The business of the professional money-lender is one which, as

708
Although in general there is no limit on the amount of interest which a borrower may agree to pay, equity has always been ready to grant relief from unconscionable bargains. This equitable relief is still available, though it is not so wide as the relief now given to borrowers under the Money-lenders Act 1900. This act provides that where proceedings are taken in any court by a money-lender for the recovery of money lent, and there is evidence which satisfies the court that the interest charged on the loan, or the amounts charged for expenses, inquiries, fines, bonus, premium, renewals, &c., are excessive, and that in either case the transaction is harsh and unconscionable, or is otherwise such that a court of equity would grant relief, the court may reopen the transaction and take an account between the money-lender and the person sued, and may, notwithstanding any statement or settlement of account or any agreement purporting to close previous dealings and create a new obligation, reopen any account already taken between them and relieve the person sued from payment of any sum in excess of the sum adjudged by the court to be fairly due in respect of such principal, interest and charges as the court, having regard to the risk and all the circumstances, may adjudge to be reasonable.

The Money-lenders Act of 1900 was passed in consequence of grave abuses which had arisen. It had been the practice of a certain class of lender to trade under a variety of names; so that under one name the same individual would lend money to a person who borrowed from him under another name; the second loan would be spent in liquidating the first, and the borrower finding it always easy to obtain more money would continue borrowing until he became hopelessly involved. The act struck at the root of this pernicious system by providing that every money-lender, as defined by the act, must register himself under his true name, or under another name, and with the address, or all the addresses if more than one, at which he carries on his business of a money-lender. If a money-lender fails to register himself, or if he carries on a money-lending business otherwise than in his registered name, or in more names than one, or elsewhere than at his registered address, he is liable on summary conviction to a fine, not exceeding one hundred pounds. For the purposes of the act the "money-lender" is defined as including every person whose business is that of money-lending, but it does not include pawnbrokers, in respect of business carried on by them under the Pawnbrokers Act, Registered Friendly, Loan or Building Societies, corporate bodies incorporated or empowered by special act of parliament to lend money, persons bona fide carrying on the business of banking or insurance, or bona fide carrying on any business not having for its principal object the lending of money or anything resembling money, for the time being exempted from registration by order of the Board of Trade.

The act is not confined to providing for the registration of money-lenders and for the reopening of harsh and unconscionable bargains. A check is placed on false representations and promises made with the intention of inducing a borrower to enter into a loan transaction. If any money-lender, or any manager, agent or clerk of a money-lender, or any person being a director, manager or other officer of a corporation carrying on the business of a money-lender, by any false or fraudulent statement, representation, promise or by any dishonest concealment of material facts, fraudulently induces, or attempts to induce, any person to borrow money or to agree to the terms on which money is to be borrowed, he is declared by the act to be guilty of a summary offence liable to a fine of not more than one hundred pounds or to imprisonment with or without hard labour for a term not exceeding two years, or to a fine not exceeding five hundred pounds, or to both.

The act further provides that any one for the purpose of earning interest on any money lent, reward or other profit sends or causes to be sent to a person whom he knows to be an infant any circular or other document which invites the person receiving it to borrow money or to apply to any person or at any place with a view to obtain money, or if the advice or opinion of such person be given for the purpose of earning or being liable, if convicted on indictment, to imprisonment with or without hard labour, or to a fine, or to both imprisonment and fine. If any such circular or document sent to an infant purports to issue from the address therein or describes any address as the place at which application is to be made with reference to the subject matter of the document, and at that place there is carried on any business connected with loans, every person who attends such place for the purpose of taking part in or assisting in the carrying on of such business will be deemed to have sent or caused to be sent such circular or document, unless he proves that he was not in any way a party to and was wholly ignorant of the sending of such document. Moreover, by section 5 of the Money-lenders Act 1900, where any action is brought against the senders of these circulars to infants, if it is proved that the person to whom the document was sent is an infant, the person charged will be deemed to have been cognisant of the fact unless he proves that he does not know, at the time of sending the circular, that the receiver was an infant.

Under the act of 1892 this shifting of the burden of proof only occurred if the circular had been sent to any person at any university, college, school or other place of education.

Aside from the recovery of money lent: if the loan is not tainted with illegality or immorality, or made for a purpose contrary to public policy, the amount may be recovered by a common law action. Where an intending borrower breaks his agreement to borrow, and his default is justly considered a breach of the contract, the damages recoverable must be measured by the loss sustained through the breach and not by the sum agreed to be lent (The South African Territories, Limited v. Wallington (1897), 1 Q.B. 652).

AUTHORITIES.—On equitable relief to borrowers reference should be made to Bellot and Wilks's Bargains with Money-lenders. On the law under the act of 1900 see Hastings's Law relating to Money-lenders and Unconscionable Bargains; and Edmonds's Money-lenders Act 1900. For the taxation of the Jews in the middle ages, see Bridges, The Jews of Europe in the Middle Ages, and Gneist's History of the English Constitution. For American law relating to Usury, see Stimson's American Statute Law, and the statutes of the various states. For France and Germany, see the codes of those countries.

MONFORTE, or MONFORTE DE LÉMOS, a town of north-western Spain, in the province of Lugo, on the Cabe, a small right-hand tributary of the Sil, and at the junction of the railways from Tuy and Astorga to Corunna. Pop. (1900), 12,912. Montoro is built on a hill surmounted by a ruined medieval citadel; it contains an ancient Benedictine monastery converted into a hospital, a Jesuit college, and a fine Renaissance parish church, besides several convents and palaces of the Leonese nobility. Montoro has manufactures of soap and linen, and some trade in timber and livestock.

MONGE, GASPARD (1746–1818), French mathematician, the inventor of descriptive geometry, was born at Beaune on the 10th of May 1746. He was educated first at the college of the Oratorians at Beaune, and then in their college at Lyons—where, at sixteen, the year after he had been learning physics, he was struck by smallpox. Returning to Beaune for a vacation, he made, on a large scale, model productions of the methods of observation and constructing the necessary instruments; the plan was presented to the town, and preserved in their library. An officer of engineers seeing it wrote to recommend Monge to the commandant of the military school at Mâzères, and he was received as a draftsman and pupil in the practical school attached to that institution; the school itself was of too aristocratic a character to allow of his admission to it. His manual skill was duly appreciated: "I was a thousand times tempted," he said long afterwards, "to tear up my drawings in disgust at the esteem in which they were held, as if I had been good for nothing better." An opportunity, however, presented itself: being required to work out from data supplied to him the "déflement" of a proposed fortress (an operation then only performed by a long arithmetical process), Monge, substituting for this second method, obtained the result so quickly that the commandant at first refused to receive it—"the work was unnecessary for the work had not been taken; but upon examination the value of the discovery was recognized, and the method was adopted. And Monge, continuing his researches, arrived at that general method of the application of geometry to the arts of construction which is now called descriptive geometry (see GEOMETRY, DESCRIPTIVE). But such was the system in France before the Revolution that the officers instructed in the method were strictly forbidden to communicate it even to those engaged in other branches of the public service; and it was not until many years afterwards that an account of it was published.

In 1768 Monge became professor of mathematics, and in 1771 professor of physics, at Mâzères; in 1773 he married Mme Horbon, a young widow whom he had previously defended in a very spirited manner from an unfounded charge; in 1780 he was appointed to a chair of hydraulics at the Lyceum in Paris
MONGHYR—MÔNG NAI

(heled by him together with his appointments at Mèzières), and was received as a member of the Académie; his intimate friendship with C. L. Berthollet began at this time. In 1783, quitting Mèzières, he was, on the death of É. Bézout, appointed examiner of naval candidates. Although pressed by the minister to prepare for a complete course of mathematics, he declined to do so, on the ground that it would deprive Mme Bézout of her only income, from the sale of the works of her late husband; he wrote, however (1786), his Traité élémentaire de la statique.

Monge contributed (1770-1790) to the Memoirs of the Academy of Turin, the Mémoires des savants étrangers of the Academy of Paris, the Mémoires of the same Academy, and the Annales de chimie, various mathematical and physical papers. Among these may be noticed the memoir "Sur la théorie des déblais et des remblais" (Mém. de l'acad. de Paris, 1781), which, while giving a remarkably elegant investigation in regard to the problem of earth-work required in the title, establishes in connexion with it his capital discovery of the curves of curvature of a surface. Léonard Euler, in his paper on curvature in the Berlin Memoirs for 1760, had considered, not the normals of the surface, but the normals of the plane sections through a particular normal, so that the question of the intersection of such curves of curvature, in Monge's terms, he declined to do; so, among the ordinary differential equation of the curves of curvature, and establishes the general theory in a very satisfactory manner; but the application to the interesting particular case of the ellipsoid was first made by him in a later paper in 1795. A memoir in the volume for 1785 relates to the production of water by the combustion of hydrogen; but Monge's results had been anticipated by Henry Cavendish.

In 1792, on the creation of the Legislative Assembly of an executive council, Monge accepted the office of minister of the marine, but retained it only until April 1793. When the Committee of Public Safety made an appeal to the savants to assist in producing the matériel required for the defence of the republic, he applied himself wholly to these operations, and distinguished himself by his indefatigable activity therein; he wrote at this time his Description de l'art de fabriquer les canons, and his Avis aux ouvriers en fer sur la fabrication du traiter. He took a very active part in the measures for the establishment of the normal school (which existed only during the first four months of the year 1795), and of the school for public works, afterwards the polytechnic school, and was at each of them professor for descriptive geometry; his methods in that science were first published in the form in which the shorthand writers took down his lessons given at the normal school in 1795, and again in 1798-1799.

In 1796 Monge was sent into Italy with C. L. Berthollet and some artists to receive the pictures and statues levied from several Italian towns, and made there the acquaintance of General Bonaparte. Two years afterwards he was sent to Rome on a political mission, which terminated in the establishment, under A. Masséna, of the short-lived Roman republic; and he thence joined the expedition to Egypt, taking part with his friend Berthollet as well in various operations of the war as in the scientific labours of the Egyptian Institute of Science, which he was one of the originators of. As soon as the country was subdued he returned with him in 1798 to France. Monge was appointed minister of the Egyptian commission, and he resumed his connexion with the polytechnic school. His later mathematical papers are published (1794-1816) in the Journal and the Correspondance of the polytechnic school. On the formation of the Senate he was appointed a member of that body, with an ample provision and the title of count of Pelusium; but on the fall of Napoleon he was deprived of all his honours, and even excluded from the list of members of the reconstituted Institute. He died at Paris on the 28th of July 1818.

For further information see B. Brisson, Notice historique sur Gaspard Monge; Dupin, Essai historique sur les services et les travaux scientifiques de Gaspard Monge (Paris, 1819), which contains (pp. 162-166) a list of Monge's memoirs and works; and the biography by F. Arago (Œuvres, t. ii., 1854).

Monge's various mathematical papers are to a considerable extent reproduced in the Application de l'analyse à la géométrie (4th ed., last revised by the author, Paris, 1819); the pure text of this is reprinted in the 5th ed. (Paris, 1827); and the Mémoires de l'académie, 8th édition, conforme à la précédente, par M. Hachette, et suivi d'une note sér. par M. Cauchy (Paris, 1846); and the Géométrie descriptive (originating, as mentioned above, in the lessons given at the normal school). The 4th edition, published shortly after the author's death, seems to have been substantially the same as the 7th (Géométrie descriptive par G. Monge, Notice d'une théorie des ombres et de la perspective, extrait des papiers de l'auteur, par M. Brisson (Paris, 1847).

MONGHYR, a town and district of British India, in the Bhagalpur division of Bengal. The town is on the right bank of the Ganges, and has a railway station, with steam ferry to the railway on the opposite bank of the river. Pop. (1901), 35,880. In 1795 Monghyr, a fortress of great natural strength, appears to have been taken by Mahomed Bakhiyar Khilji, the first Moslem conqueror of Bengal. Henceforth it is often mentioned by the Mahomedan chroniclers as a place of military importance, and was frequently chosen as the seat of the local government. After 1590, when Akbar established his supremacy over the Afghan tribes of Bengal, Monghyr was long the headquarters of his general, Todor Mal; and it also figures prominently during the rebellion of Sultan Shuja against his brother, Aurangzeb. In more recent times Nawab Mir Kasim, in his war with the English, selected it as his residence and the centre of his military preparations.

Monghyr is famous for its manufactures of iron: firearms, swords, and iron articles of every kind are produced in abundance but are noted for cheapness rather than quality. The art of inlaying sword-hilts and other articles with gold and silver affords employment to a few families.

The District of Monghyr has an area of 3,922 sq. m. The Ganges divides it into two portions. The northern, intersected by the Burhi Gandak and Tiljuga, two important tributaries of the Ganges, is always liable to inundation during the rainy season, and is a rich, flat, wheat and rice country, supporting a large population. A considerable area, immediately bordering the banks of the great rivers, is devoted to permanent pasture. Immense herds of buffaloes are sent every hot season to graze on these marshy prairies; and the ghâ, or clarified butter, made from their milk forms an important article of export to Calcutta.

To the south of the Ganges the country is dry, much less fertile, and broken up by fragmentary ridges. Irrigation is necessary throughout the season lying on the south of the Ganges. The population in 1901 was 2,068,804, showing an increase of 1-6% in the decade. The principal exports sent to Calcutta, both by rail and by river, are oil-seeds, wheat, rice, indigo, grain and pulse, hides and tobacco; and the chief imports consist of European piece-goods, salt and sugar. The southern portion of the district is well provided with railways. At Lakhisarai junction the line and chord lines of the East Indian railway divide, and here also starts the branch to Gaya. At Jamalpur, which is the junction for Monghyr, are the engineering workshops of the company. In the early years of British rule Monghyr was a separate part of Bhagalpur, and was not created a separate district till 1832.

See Monghyr District Gazetteer (Calcutta, 1909).

MÔNG NAI (called by the Burmese and on most old maps Mong), one of the largest and most important of the states in the eastern subdivision of the southern Shan States of Burma. The state of Kêng Tawng (Burmese Kaying Taung) is a dependency of Môn Nai. It lies approximately between 26° 10' and 21° 15' N. and between 97° 30' and 98° 45' E., and occupies an area of 2,717 sq. m.; pop. (1901), 44,252, of whom more than five-sixths are Shans. The Salween river bounds it on the east. The main state and the sub-state of Kêng Tawng consist of two plains with a ridge between them. There is much flat rice bottom, but a considerable portion consists of gently undulating plain-land. In the central plain rice is the only crop. Outside this considerable quantities of sugar are produced. Tobacco of a quality highly esteemed by the Shans is grown in the Nawnaw Wawp circle at an altitude of 3,100 ft. above sea-level; gram,
MONGOLIA, a vast territory belonging to the Chinese empire, the administrative limits of which cannot be determined with precision. On the N. it is bounded by the frontier of Russia, beginning at Mount Kalas or Kanas (49° 5' N., 87° 40' E.) in the Altai, and running to the S.E. corner of Transbaikalia in the vicinity of Dalai-nor, thus having on the N. the Siberian provinces of Tomsk, Yeniseisk, Irkutsk and Transbaikalia. In the E. the boundary line which separates Mongolia from Manchuria runs past Dalai-nor and Lake Buir, crossing the Great Khingan in 45° 30' N., towards Tilton in Manchuria; then, crossing the Nonni river, it strikes the Sungari at Khulan-chon, where it turns westwards up this river, reaching the Shara-muren river in 123° 30' E. From China proper on the S. Mongolia is separated by a line running in a south-westward direction up the Shara-muren and across the Mongolian plateau to the bending of the Hwang-ho river, on the border-ridge, about 104° 30' E. Thence it turns north-west, following the Great Wall for over 300 m.; it then crosses the plateau so as to separate Mongolia from the Chinese province of Sin-Kiang (Hsin-su-sin-ts'ing), which includes the Nan-shan highlands and eastern Turkestan, and from Dzungaria, reaching the Chinese or Ektagh Altai in 46° 30' N., 92° 30' E. From that point the boundary coincides with the main water-parting of the Altai Mountains till it reaches Mount Kalas.

Geographically, Mongolia may thus be said to occupy both terraces of the great plateau of east Asia, which stretches in the south of Siberia, between the Saluaghem range of the Great Altai and the Great Khingan— with the exception of the Dzungarian depression. From Manchuria and China it is separated by the border ridge of the plateau—the Great Khingan, which in the south-west it runs up to the foot of the high southern border ridge of the Tibetan plateau—an artificial frontier separating it from eastern Turkestan and Dzungaria. Broadly speaking, Mongolia may be divided naturally into three parts: (1) north-western Mongolia, which occupies the high terrace of the plateau; (2) the Gobi, in its wide sense, covering the lower terrace of the plateau, together with a slightly more elevated and better-watered zone along the western slope of the Great Khingan and its south-western continuation; and (3) south-eastern Mongolia, on the eastern slope of the Khingan. Of these parts, the second is considered in detail under the heading Gobi.

North-western Mongolia was formerly represented as a region intersected by lofty mountain chains. It appears, however, from Russian explorations during the last third of the 19th century, that it has all the characteristics of an extensive plateau, of a rhombic shape (like Bohemia), bounded by four mountain ranges: namely, the Russian Altai on the N.W., the Sayans on the N.E., the Kentei range on the S.E., and the Ektagh Altai on the S.W. The border-ridge character of the high belt which divides the same orographic character is confirmed by recent explorers with regard to the Saluaghem range of the Altai. The only point still remaining undecided is whether the valleys of the Bot-khemchik (a tributary of the east branch of the Yenisei), and the summit of the Altai range, are not long geographically to the Altai region. At any rate, throughout the whole of north-west Mongolia, which covers an area of nearly 370,000 sq. m., the altitude nowhere falls below 2370 ft. (Ula-nor); the highest point is Mount Buyantu, which stands 9550 ft. above sea-level; the average altitude covers only 6206 sq. m. The remaining of this extensive territory ranges at altitudes of 3000 to 4500 ft., even in the bottoms of the river valleys and in the lower plains; while the ridge is seen to the west and the northern part of the plateau above the general level of the plateaux. Along the south-western border of this division of Mongolia a gigantic border-ridge, the Ektagh (or Mongolian) Altai, runs in an E.S.E. direction from the Russian Altai to 90° E. and is probably continued even farther by the Artsa-bogdo, the Saikhat and other ranges as far as the northern loop of the Yellow river. The passes across the Ektagh Altai lie at altitudes of 10,000 ft. in the north-west and 9250 ft. in 93° 20' E.; farther east they become much lower. But while its southern foot stands in the Dzungarian trench, i.e. at altitudes of 1550 ft. only near Lake Uulungur, and at 3300 ft. in 94° E., its north-eastern foot rests on the high plateau, i.e. at 4260 ft. at Mount Shara-muren, on the Ongot, and at 3690 ft. at Mount Outege, the Tien-shan, and the Altai. The two last are called, to the north of Ulang, and the Yablonoi Mountains of Transbaikalia, separate the higher terrace of north-west Mongolia (drained by the tributaries of the Selenga) from the lower terrace of the Gobi, which is connected by the Ounegh. The Gobi is connected to the Ektagh Altai by the Kerulen, both belonging to the basin of the Amur. It is very probable that the Tannu-ola Mountains north-east of Ubsa-nor, and the Khangai Mountains between Ulyasatul and the upper Amur, belong to the Eektagh Altai. Thus the broad terrace of the same great plateau of north-west Mongolia, upon which Lake Kossogol lies, at an altitude of 5320 ft. On this vast upper terrace even the bottoms of the river valleys are at altitudes of 4300 to 5500 ft., with one single exception, the narrow gorge of the Khos (Khis-khem), or upper Yenisei; while the highest pass across the Tannu-ola Mountains is 7090 ft., though the others are much lower. The conception of north-west Mongolia as a region filled with mountain ranges radiating from the Altai must therefore be abandoned. The country is so dry that the vegetation naturally predominates the northern counterpart of the plateau of Tibet. This massive swelling is cut into, between the Ektagh Altai and the eastern Tien-shan, by the depression of Tarbagatay and the ranges of the Ussuri, which includes the Khabar and the eastern Tien-shan comes the Tarim depression, from 2200 to 3000 ft. high, and occupying an area of about 88,000 sq. m. Neither of these depressions, however, penetrates beyond 94° E., and on the eastern side of Khabar (Khein) there is only one single place (42° N.) in which the altitude drops as low as 3300 ft.; everywhere else it varies between 4000 and 5000 ft.

Lakes and Rivers.—North-western Mongolia is well wooded, and heavily watered. Both the western part of the country, which faces to the ocean, being in reality the rapidly dissecting remains of what were formerly much larger basins. The chief of them is Ubsa-nor (2570 ft.), which receives the large river Tes. It lies in the middle of the Tannu-ola basin, and is fed by the higher lakes, Uga-nor, besides several smaller ones. Farther south on the same plain lie the sisters lakes Kirghiz-nor and Airy-kor, which receive another large river, the Dzasp'yn, and the Kungui. These lakes are joined to the small lakes on their eastern side. A third group of lakes occur in the neighbourhood of Kobo. The Kobo river, which rises in the Dain-gol (7600 ft.) in the Ektagh Altai, winds in great curves across the plateau, and enters Lake Kara-uru (3260 ft.), which also receives the Buyantu, an outflow from Lake Kobo, and is connected by a small river with another large lake, Durga-nor, situated a score of miles to the east. There are also many smaller lakes fed by the glaciers of the Saluaghem range, all of which are together connected by the Ektagh Altai. The largest lake of which is the Yenisei, (Khusbu-gul), which lies at an altitude of 5320 ft., close to the Russian frontier, at the foot of the snow-clad Munku-sardyk. Besides the rivers just mentioned, there are others belonging to the basin of the Yenisei (Khusbu-gul, Ubsa-nor, the Bot-khemchik); while yet others belong to the Selenga, a river formed by the junction of the Eder with the Teglir. The Selenga receives the Orkhon, at the head of which remarkable inscriptions were found in the end of the 19th century, and cleverly deciphered by Professor V. Thomsen of Copenhagen.1 The rivers which flow down the outer slopes of the border-ridges become lost in the Gobi shortly after entering it.

1 See V. Thomsen, Inscriptions de l'Orkhon (Helsingfors, 1900)
they are dried before they reach north-western Mongolia. The yearly amount of rain at Urga (altitude 4350 ft., at the northern foot of the Kentei Mountains) is only 9.4 in., and the average temperatures are: year 27°F, January -18°, July 64°; a minimum of -6°F, and a maximum of 105°F. The average temperatures of Urga (4500 ft.) may be taken as typical, its average temperatures being: year 31-6°F, January -12°, July 66°.

The geology is very imperfectly known. The plateau is built up of granites, gneisses and crystalline schists of Archean and probably primary age. Coal is known to exist to the south-east of Koblo, in the Tannu-olla, and in the basin of the Yenisei, but its age is unknown (fresh-water Jurassic). Graphite and some silver are also found.

The fauna is a mixture of the Siberian and the Daurian—the latter penetrating up the valleys of the Selenga basin. The chief towns of north-west Mongolia are Uurga, Ulyasutai, Kalgan and Ulankom. Uurga is the capital of the Khalkhid or Khalkas, lying on the eastern slope of the Great Khingan Mountains, entering like a wedge between the lower course of the Nonni river and the middle Sungari. Chiefly owing to the dryness of climate, the fauna is very insignificant. Mongolia proper, except that the altitude of the plains is much lower. This portion of Mongolia is also much better watered, namely, by the Khatyr, the Lao-ho and the Shara-muren, all flowing from the Khingan Mountains eastwards, and the last making the frontier between Mongolia and the Chinese province of Chihli.

**Population.**—The population of the whole of Mongolia is estimated at about 5,000,000. It consists of Mongols—Eastern Mongols and Kalmysks in the west—various Turken tribes, Chinese and Tunguses. The Mongols proper, with the exception of those who inhabit north-west Mongolia, may be divided into northern and southern (more properly north-western and south-eastern) Mongols. The former, belonging to the Khalkas, occupy the Gobi and the regions of the Kentei and Khingan Mountains, while the second, divided into numerous minor branches, roam over south-eastern and southern Mongolia. The principal occupation of the Mongols is cattle-breeding, and Russian writers estimate that on an average each yurt or family, has about 50 sheep, 25 horses, 15 horned cattle and 10 camels. The transport of goods is their next most important occupation. It is calculated that 100,000 camels are used for the transport of tea only from Kalgan to Shanghai, and in addition 10,000 ox-carts are employed in the internal caravan trade. Agriculture is only carried on sporadically, chiefly in the south, where the Mongols have been taught by the Chinese. Various domestic industries are also carried on. The trade is chiefly concentrated at Urga, Ulyasutai and Koblo in north-west Mongolia; Kalgan, Kuku-khoto, Kuku-ergi, Dolon-nur and Biru-khoto in southern and south-eastern Mongolia; and at Kerulen in the north-east.

**Administration.**—Before the Manchurian conquest the Mongols were governed by their own feudal princes, who regarded themselves as being descended from seven different ancestors, all, however, of the same kin. Each group of principalities constituted a separate aimak, and each principality a separate hoshan. Under Manchu rule the aimaks became converted into the same number of military corps, each composed of so many hoshans as military units. Each of these again was divided into zhals, or groups containing so many families. In case a hoshan contained more than 6 zhals, every 6 of the latter were organized into a regiment—tselan. Four Manchu tsian-tsuns, or governor-generals, acted as chiefs of the troops, and the prince of each aimak, nominated from Peking, was considered as the lieutenant or assistant of his respective Manchu chief. The hoshans were subject to their own princes, each of whom had a military adviser, generally a Manchu. Their internal or tribal affairs were in the hands of the princes, these being similar to a president, tutulakhi, nominated from Peking.

Mongolia is now administered by a Lijan Yuen or superintendent with headquarters at Peking. Excluding the territory to which the name of Mongolia is geographically applied, but which is included in the provinces of Shanhsi and Chihli, Mongolia is divided into inner and outer divisions. Inner Mongolia, lying between the desert of Gobi, China proper and Manchuria, is divided into 24 aimaks. There are two military governors general and two commissaries of the viceroy of Chihli, having control of civil matters. One of each pair of officials is stationed at Kalgan, and the other at Jehol. Outer Mongolia, the remainder of the territory, has 4 aimaks, three of which are under hereditary khans. There is a Chinese imperial agent at Urga.

**Authorities.**—The following works in Russian are the most important: Prijevalsky, Mongolia and the Land of the Tanguts (1875), and Manchuria and Mongolia (1880); N. Potanin, Sketches of North-West Mongolia (1881-1883); The Tytler-Tibet Border of China and Central Mongolia (1893 seq.); V. Pevtsovsk, Sketch of a Journey to Mongolia, &c. (Omsk, 1883); D. Pozdnioeff, Towns and Road in Mongolia and我14, Ulyasutai, Kalgan, Koko-say and the Kansu-Mongolia (1896 and 1899); and the article "Mongolia" in Russian Encycl. Dictionary, vol. xiv. (1866); G. and M. Grinzaimo, Description of a Journey to Western China (1880-1890); V. Pevtsovsk, F. K. Bogdanovitch, and P. K. Kalotoff, The Tibet Expeditions (1886-1902); V. Obruchew, Trenches of the Kansu and the Nan-shan (1900-1901); G. Krasnovsky, Geogr. Descr. of Chinese Empire (1888); Batorsky, Essay of a Military and Statistical Sketch (1890); A. Woykeloff, Climates of the Earth (1894); Mongolia and Kansu, Statistical Notice (1884-1887); See also R. Pumpey, Govt. Researches (Washington, 1866); Ney Elias, in Journal R.G.S. (1873); Baron Richthofen, China (1877); J. Gilmore, Among the Mongols (1883); W. W. Rockhill, Journey through Mongolia and China (1894); F. E. Young, The Heart of a Continent (1896).

P. A. K. J.

**MONGOLS.**

The name of one of the chief ethnographical divisions of the Asiatic peoples (see also Turks). The early history of the Mongols, like that of all central-Asian tribes, is extremely obscure. Even the meaning of the name "Mongol" is a disputed point, though a general consent is now given to Schott's etymology of the word from mong, meaning brave. From the earliest and very scanty notice we have of the Mongols in the history of the T'ang dynasty of China (A.D. 610-690) and in works of later times, it appears that their original camping-grounds were along the courses of the Kerelen, Upper Nonni and Argun rivers. But in the absence of all historical particulars of the Mongol origin, legend, as is usual, has been reduced to early years. The Mongol historian Sanang Setzen gives currency to the myth that they sprang from a blue wolf; and the soberest story on record is that their ancestor Budantarsar was miraculously conceived of a Mongol widow. By craft and violence Budantarsar gained the chieftainship over a tribe living in the neighbourhood of his mother's tent, and thus left a heritage to his son. Varying fortunes attended the descendants of Budantarsar, but on the whole their power gradually increased, until Yesukai, the father of Jenghiz Khan, who was eighth in descent from Budantarsar, made his authority felt over a considerable area. How this dominion was extended under the rule of Jenghiz Khan is shown in the article JENGHIZ KHAN, and when that great conqueror was laid to rest in the valley of Kilen in 1227 he left to his sons an empire which stretched from the China Sea to the banks of the Dnieper.

The whole of this vast region Jenghiz Khan set his second surviving son Ogotai or Ogdi as khakan, or chief khan, while to the family of his deceased eldest son Jufi he assigned the country from Kayalik and Kharwiz to the borders of Bulgar and Saksin "where'er the hoofs of Mongol horse had tramped"; to Jagatai, his eldest surviving son, the territory from the borders of the Ughur country to Bokhara; while Tulé, the youngest, received charge of the home country of the Mongols, the care of the imperial encampment and family, and of the archives of the state. The appointment of Ogdi as his successor being contrary to the usual Mongol custom of primogeniture, gave rise to some bitterness of feeling among the followers of Jagatai. But the commands of Jenghiz Khan subdued these murmurs, and Ogdi was finally led to the throne by his dispossessed brother amid the plaudits of the assembled Mongols. In accordance with Mongol customs, Ogdi signalized his accession to the throne by distributing among his grandees presents from his father's treasures, and to his father's spirit he sacrificed forty maidens and numerous horses. Once fairly on the throne, he set himself vigorously to
MONGOLS

follow up the conquests won by his father. At the head of a large army he marched southwards into China to complete the ruin of the Kin dynasty, which had already been so rudely shaken, while at the same time Tüle advanced into the province of Honan from the side of Shensi. Against this combined attack the Kin troops made a vigorous stand, but the skill and courage of the Mongols bore down every opposition, and over a hecatombed of slaughtered foes they captured Kai-feng Fu, the capital of their enemies. From Kai-feng Fu the emperor fled to Ju-ning Fu, whither the Mongols quickly followed. After sustaining a siege for some weeks, and enduring all the horrors of starvation, the garrison submitted to the Mongols, and at the same time the emperor committed suicide by hanging. Thus fell in 1234 the Kin or “Golden” dynasty, which had ruled over the northern portion of China for more than a century.

But though Ogdai’s first care was to extend his empire in the rich and fertile provinces of China, he was not forgetful of the obligation under which Jenghiz Khan’s conquests in western Asia had laid him to maintain his supremacy over the kingdom of Khwarizm. This was the more incumbent on him since Jelal ed-din, who had been driven by Jenghiz into India, had returned, reinforced by the support of the sultan of Delhi, whose daughter he had married, and, having reconquered his hereditary domains, had advanced westward as far as Tiflis and Kelat. Once more to dispossession the young sultan, Ogdai sent a force of 300,000 men into Khwarizm. With such amazing rapidity did this army march in pursuit of its foe that the advanced Mongol guards reached Amid (Diaribekr), whither Jelal ed-din had retreated, before that unfortunate sovereign had any idea of their approach. Accompanied by a few followers, Jelal ed-din fled to the Kurious Mountains, where he was basely murdered by a peasant.

The primary object of the Mongol invasion was thus accomplished; but, with the instinct of their race, they made this conquest but a stepping-stone to another, and without a moment’s delay, pushed on still farther westward. Unchecked and almost unopposed, they overran the districts of Diaribekr, Mesopotamia, Erbil and Kelat, and then advanced upon Azerbaijan. In the following year (1236) they invaded Georgia and Great Armenia, committing frightful atrocities. Tiflis was among the cities captured by assault, and Kars was surrendered at their approach in the vain hope that submission would gain clemency from the victors. Meanwhile, in 1235, Ogdai despatched three armies in as many directions. One was directed against Korea, one against the Sung dynasty, which ruled over the provinces of China south of the Yangtzen Kiang, and the third was sent westward into eastern Europe. This last force was commanded by Batu, the son of Jufi. Ogdai’s deceased eldest brother, who took with him the celebrated Sabutai Bahadur as his chief adviser, Benabri, the capital city of the Bulgars, fell before the force under Sabutai, while Batu pushed on over the Volga. With irresistible vigour and astonishing speed the Mongols made their way through the forests of Penza and Tamboy, and appeared before the “beautiful city” of Ryazan. For five days they discharged a ceaseless storm of shot from their balistae, and, having made a breach in the defences, carried the city by assault on the 21st of December 1237. “The prince, with his mother, wife, sons, the boyars and the inhabitants, without regard to age or sex, were slaughtered with the savage cruelty of Mongol revenge; some were impaled, some shot at with arrows for sport, others were flayed or had nails or splinters of wood driven under their nails. Priests were roasted alive, and nuns and maidens ravished in the churches before their relatives. ’No eye remained open to weep for the dead.’” Moscow, at this time a place of little importance, next fell into the hands of the invaders, who then advanced against Vladimir. After having held out for several days against the Mongol attacks, the city at length succumbed, and the horrors of Ryazan were repeated. If possible, a more dire fate overtook the inhabitants of Kozeisk, near Kaluga, where, in revenge for a partial defeat inflicted on a Mongol force, the followers of Batu held so terrible a “carnival of death” that the city was renamed by its captors Mobalig, “the city of woe.” With the tide of victory thus strong in their favour the Mongols advanced against Kiev, “the mother of cities,” and carried it by assault. The inevitable massacre followed, and the city was razed to the ground. Victorious and always advancing, the Mongols, having desolated this portion of Russia, moved on in two divisions, one under Batu into Hungary, and the other under Baidar and Kaidu into Poland. Without a check, Batu marched to the neighbourhood of Pest, where the whole force of the kingdom was arrayed to resist him. The Hungarian army was posted on the wide heath of Mohi, which is bounded by the vine-clad hills of Tokay, the mountains of Lomnitz, and the woods of Dysgor. To an army thus hemmed in on all sides defeat meant ruin, and Batu instantly recognized the dangerous position in which his enemies had placed themselves. To add to his chances of success he determined to deliver his attack by night, and while the careless Hungarians were sleeping he launched his battalions into their midst. Panic-stricken and helpless, they fled in all directions, followed by their merciless foes. Two archbishops, three bishops, and many of the nobility were among the slain, and the roads for two days’ journey from the field of battle were strewn with corpses. The king, Bela IV., was saved by the fleetness of his horse, though closely pursued by a body of Mongols, who followed at his heels as far as the coast of the Adriatic, burning and destroying everything in their way. Meanwhile Batu captured Pest, and on Christmas Day 1241, having crossed the Danube on the ice, took Esztergom by assault. While Batu had been thus triumphing, the force under Baidar and Kaidu had carried fire and sword into Poland. While laying waste the country they received the announcement of the death of Ogdai, and at the same time a summons for Batu to return eastwards into Mongolia.

While his lieutenants had been thus carrying his arms in all directions, Ogdai had been giving himself up to ignoble ease and licentiousness. Like many Mongols, he was much given to drink, and it was to a disease produced by this excess that he finally succumbed on the 11th of December 1241. He was succeeded by his son Kuyuk, who reigned only seven years. Little of his character is known, but it is noticeable that his two ministers to whom he left the entire conduct of affairs were Christians, as also were his doctors, and that a Christian chapel stood before his tent. This leaning towards Christianity, however, brought no peaceful tendencies with it. On the death of Kuyuk dissensions which had been for a long time smouldering between the houses of Ogdai and Jagatai broke out into open war, and after the short and disputed reigns of Kaidu and Chapai, grandsons of Ogdai, the lordship passed away for ever from the house of Ogdai. It did not go, however, to the house of Jagatai, but to that of Tule.

On the 1st of July 1253, Mangu, the eldest son of Tule, and nephew to Ogdai, was elected khakan. With perfect impartiality, Mangu allowed the light of his countenance to fall upon the Christians, Mahommedans and Buddhists among his subjects although Shaminism was recognized as the state religion. Two years after his accession his court was visited by Rubruquis (q.v.) and other Christian monks, who were hospitably received. The description given by Rubruquis of the khakan’s palace at Karakorum shows how wide was the interval which separated him from the nomad, tent-living life of his forefathers. It was “surrounded by brick walls. . . . Its southern side had three doors. Its central hall was like a church, and consisted of a nave and two aisles, separated by columns. Here the court sat on great occasions. In front of the throne was placed a silver tree, having at its base four lions, from whose mouths there spouted into four silver basins wine, kumiss, hydromel and water. At the top of the tree a silver angel sounded a trumpet when the reservoirs that supplied it were replenished.” On his accession complaints reached Mangu that dissensions had broken out in the province of Persia, and he therefore sent a force under the command of his brother Hulagu to punish the Ismailites or Assassins (q.v.), who were held to be the cause of the disorder. Marching
MONGOLS

by Samarkand and Karshi, Hulagu crossed the Oxus and advanced by way of Balkh into the province of Kuhistan or Kohistan. The terror of the Mongol name induced Rukneddin Gurbash (Rokn al-din), the chief of the Assassins, to depreciate the wrath of Hulagu by offers of submission, and he was so far deceived, that he was able to purchase a temporary immunity from massacre by dismantling fifty of the principal fortresses in Kohistan. But when once the country had thus been left at the mercy of the invaders, their belief in the old saying "Stone dead hath no fellow" sharpened their battle-axes, and, sparing neither man, woman, nor child, they exterminated the unhappy people. Rukneddin having been killed, 1256 (see Assassins), Hulagu marched across the snowy mountains in the direction of Bagdad to attack the last Abbasid caliph and his Seljuk protectors. On arriving before the town he demanded its surrender. This being refused, he laid siege to the walls in the usual destructive Mongol fashion, and at length, finding resistance hopeless, the caliph was induced to give himself up and to open the gates to his enemies.

On the 15th of February 1258 the Mongols entered the walls and sacked the city (see CALIPHATE ad fin.). While at Bagdad Hulagu gave his astronomer, Nasir al-din permission to build an observatory. The town of Maragha was the site chosen, and, under the superintendence of Nasir and his principal astronomers, Alexander, Pakhwand, and others, a great observatory was built, and furnished with "armillary spheres and astrolabes, and with a beautifully-executed terrestrial globe showing the five climates." The fall of Bagdad was almost contemporaneous with the end of the Seljuks of Konia as an independent power, though their actual destruction did not take place until 1308 (see SELJUKS). One terrible result of the Mongol invasion was a fearful famine, which desolated the provinces of Irak-Arabi, Mesopotamia, Syria, and Rum. But, though the inhabitants starved, the Mongols had strength and energy left to continue their onward march into Syria. Aleppo was stormed and sacked, Damascus surrendered (1260) and Hulagu was meditating the capture of Jerusalem with the object of restoring it to the Christians when he received the news of Mangu's death, and, as in duty bound, at once set out on his return to Mongolia, leaving Kitboga (Kitubuka) in command of the Mongol forces in Syria.

Hitherto a vassal of Mangu, as is shown by his striking coins bearing the name of Mangu as well as his own, Hulagu was not considered as the ruler of the central provinces. He assumed the title of Ilkhan, and, although acknowledging the khakan as supreme lord, was practically independent. The title of Ilkhan was that borne by his successors, who ruled over Persia for about a century (see infra, "The Ilkhans of Persia").

While Hulagu was prosecuting these conquests in western Asia, Mangu and his next brother Kublai were pursuing a like course in southern China. Southward they even advanced into Tong-king, and westward they carried their arms over the frontier into Tibet. But in one respect there was a vast difference between the two campaigns. Under the wise command of Kublai all indiscriminate massacres were forbidden, and probably for the first time in Mongol history the inhabitants and garrisons of captured cities were treated with humanity. While carrying on the war in the province of Szech'uen Mangu was seized with an attack of dysentery, which proved fatal after a few days' illness. His body was carried into Mongolia on the back of two asses, and, in pursuance of the custom of slaughter- ing every one encountered on the way, 20,000 persons were, according to Mangu's order, put to death.

At the Kuriltai, or assembly of notables, which was held at Shang-tu after the death of Mangu, his brother Kublai (see KUBLAI KHAN) was elected khakan. For thirty-five years he sat on the Mongol throne, and at his death in 1294, in his seventyninth year, he was succeeded by his son Timur Khan, or, as he was otherwise called, Oljeitu or Ulschitou Khan (Chinese Yuen-cheng). The reign of this sovereign was chiefly remarkable for the healing of the division which had for thirty years separated the families of Ogdaï and Jagatai from that of the ruling khagan. Ulshëitou was succeeded by his nephew Khaïsian, who was gathered to his fathers in February 1311, after a short reign, and at the early age of thirty-one. His nephew and successor, Buyantu (Chinese Yen-tsung), was a man of considerable culture, and substantially patronized Chinese literature. Among other benefits which he conferred on letters, he rescued the celebrated inscription-bearing "stone drums," which are commonly said to be of the Chow period (1122-255 B.C.), from the decay and ruin to which they were left by the last emperor of the Chin dynasty, and placed them in the gateway of the temple of Confucius at Peking, where they now stand. After a reign of nine years, Buyantu was succeeded by his son Gegen (Chinese Ying-tsung), who perished in 132 by the knife of an assassin.

Yissun Timur (Chinese Tai-teng-ti), who was the next sovereign, devoted himself mainly to the administration of his empire. He divided China, which until that time had been apportioned into twelve provinces, into eighteen provinces, and rearranged the system of state granaries, which had fallen into disorder. His court was visited by Friar Odoric, who gives a minute description of the palace and its inhabitants. Speaking of the palace this writer says:

"Its dimensions was raised about two paces from the ground, and within there were twenty-four columns of gold, and all the walls were hung with skins of red leather, said to be the finest in the world. In the midst of the palace was a great jar more than two cubits high, and containing the famous object called meccacauce (jade); its price exceeded the value of four large towns. Into this vessel drink was conducted by certain conduits from the court of the palace, and beside it were many golden goblets, from which the king drank who listened. When the khakan sat on his throne the queen was on his left hand, and a step lower two Mongolian women, while at the bottom of the steps stood the other ladies of his family. All those who were married wore upon their heads the foot of a man as it were a cubit and a half in length, and at the top of the foot there were certain cranes' feathers, the whole foot being set with great pearls, so that if there were in the whole world any line and large pearls they were to be found in the decoration of those ladies."

The following years were years of great natural and political convulsions. Devastating floods swept over China, carrying death and ruin to thousands of homes; earthquakes made desolate whole districts; and in more than one part of the empire the banners of revolt were unfurled. Under various leaders the rebels captured a number of cities in the provinces of Honan, Shensi, and Shantung, and took possession of Hang-chow, the capital of the Sung emperors. At the same time pirates ravaged the coasts and swept the imperial vessels off the sea.

In 1355 a Buddhist priest named Chu Yuen-chang became so impressed with the misery of his countrymen that he threw off his vestments and enrolled himself in the rebel army. His military genius soon raised him to the position of a leader, and with extraordinary success he overcame with his rude levies the trained legions of the Mongol emperor. While unable to defeat or check the rebels in the central provinces, Toghon Timur Khan was also called upon to face a rebellion in Korea. Nor were his arms more fortunate in the north than in the south. An army which was sent to suppress the revolt was cut to pieces almost to a man. These events made a dream which the emperor dreamt about this time of easy interpretation. He saw in his sleep "a wild boar with iron tusks rush into the city and wound the people, who were driven hither and thither without finding shelter. Meanwhile the sun and the moon rushed together and perished." This dream," said the diviner, "is a prophecy that this khakan will lose his empire." The fulfilment followed closely on the prophecy. By driving out the rebels, after having gained possession of most of the central provinces of the empire, captured Peking. But Toghon Timur by a hasty flight escaped from his enemies, and sought safety on the shores of the Dolon-nor in Mongolia. For a time the western provinces of China continued to hold out against the rebels, but with the flight of Toghon Timur the Mongol troops lost heart, and in 1368 the ex-Buddhist priest ascended the throne as the first sovereign of the Ming or "Bright" dynasty, under the title of Hung-wu.
and hardy the Mongols have always shown themselves to be; but
The Mongols
expelled
for establishing a settled form of government, and
from China
for gaining the allegiance of the conquered peoples,
have invariably been wanting in them.
Not content with having recovered China, the emperor
Hungwu sent an army of 400,000 men into Mongolia in pursuit
of the forces which yet remained to the khan. Even on their
own ground the disheartened Mongols failed in their resistance
to the Chinese, and at all points suffered disaster. Meanwhile
Toghon Timur, who did not long survive his defeat, was
succeeded in the khakinate by Biliktu Khan, who again in 1379
was followed by Usshakal Khan. During the reign of this last
prince the Chinese again invaded Mongolia, and inflicted
a crushing defeat on the khan’s forces in the neighbourhood of Lake
Buyur. Besides the slain, 2994 officers and 77,000 soldiers
are said to have been taken prisoners, and an immense booty
to have been secured. This defeat was the final ruin of the
eastern branch of the Mongols, who from this time surrendered
the supremacy to the western division of the tribe. At first
the Keraitis or Torgod, as in the early days before Jenghiz Khan
rose to power, exercised lordship over the eastern Mongols,
but from these before long the supremacy passed to the Oirad, who
for fifty years treated them as vassals. Notwithstanding their
subjection, however, the Keraitis still preserved the imperial
line, and khan after khan assumed the nominal sovereignty of
the tribe, while the real power rested with the descendants
of Toghon, the Oirad chief, who had originally attached them
to his sceptre. Gradually, however, the Mongol tribes broke
away from all governing centres, and established scattered
communities in the north of the entire Mongolia. The discredit of
having finally disintegrated the tribe is generally attributed to the
Kalkas, who are divided into the Western and Eastern Kalkas.
These people form the link of communication between Europe and
eastern Asia. Early in the 17th century the Russians sent
an embassy to the court of the Golden Khan with the object
of persuading the Mongol khan to acknowledge allegiance to the
tsar. This he did without much hesitation or inquiry, and he
further despatched envoys to Moscow on the return of the
Russian embassy. But the allegiance thus lightly acknowledged
was lightly thrown off, and in a quarrel which broke out between
the Khirghiz and the Russians the Kalkas took the side of the
former. Though broken, however, was soon healed over, and we
find the Golden Khan sending an ambassador to Moscow on
behalf of his master for presents of jewels, arms, a telescope,
a clock, and a monk who had been to Jerusalem that he might
teach the Kalkas how the Christians prayed.” Their
submission to Russia on the north did not save them, however,
from the Chinese attacks on the south. At that time the present
Manchu dynasty ruled in China, and to the then reigning
sovereign the Kalkas gave in their submission. For some time
the Chinese yoke sat lightly on their consciences, but difficul-
ties having arisen with the Kalmucks, they were ready enough
to claim the protection of China. To cement the alliance the
emperor K’ang-hi invited all the Kalka chiefs to meet him at
the plain of Dolon-nor. This ceremony brought the separate history
of the Kalkas to a close, since from that time they have been
engulfed in the Chinese Empire.

During the Kin dynasty of China the Keraitis, as has been
pointed out, were for a time supreme in Mongolia, and it was
during that period that one of the earliest recognized sovereigns,
Mergus Buyuruk Khan, sat on the throne. In an engagement
with a neighbouring tribe their tribe their Khan was captured
and put to death by nailing him on a wooden ass. On the treacher-
ous Tatar chief the widow determined to avenge herself, and chose
the occasion of a feast as a fitting opportunity. With well-dig-
ised friendship she sent him a present of ten oxen, a hundred
sheep and a hundred sacks of koumiss. These, last, however,
instead of being filled with skins of the liquor which Mongolians
love so well, contained armed men, who, when the Tatar was
feasted, rushed from their concealment and killed him.
Among the Mongol chiefs who rose to fame during the rule of the Ming dynasty of China was Toghon, the Kalmuck khan, who, taking advantage of the state of confusion which reigned among the tribes of Mongolia, established the empire in north-western Asia. The Kalmuck khan died, and his throne devolved upon his son Ye-seen, who was no degenerate offspring. Being without individual foes in Mongolia he turned his arms against China, which through all history has been the happy hunting-ground of the northern tribes, and had the unexampled good fortune to take prisoner the Chinese emperor Cheng-t'ung. But victory did not always decide in his favour, and after having suffered reverses at the hands of the Chinese, he deemed it wise to open negotiations for the restoration of his imperial prison. Thus, after a captivity of seven years Cheng-t'ung re-entered his capital in 1457, not altogether to the general satisfaction of his subjects. On the death of Yi-sien, shortly after this event, the Kalmucks lost much of their power in eastern Asia, but retained enough in other portions of their territory to annoy the Russians with raids within the Russian frontier, and by constant acts of pillage. In the 17th century their authority was partly restored by Galdan, a Lama, who succeeded by his restless ambition created alarm at Peking, and the emperor K'iang-hi determined to protect the Kalkas against their enemy. The emperor, in person commanding one of the two forces, marched into Mongolia. After enduring incredible hardships during the march through the desert of Gobi the imperial army encountered the Kalmucks at Chao-mo. The engagement was fiercely contested, but ended in the complete victory of the Chinese, who pursued the Kalmucks for ten miles, and completely drove them to the desert. Galdan and his followers, fled westward and escaped; and thus collapsed a power which had threatened at one time to overshadow the whole of Central Asia. For a time Galdan still maintained resistance to his powerful enemy, but death overtook him while yet in the field against the Chinese.

But though Galdan was dead the Chinese did not enjoy that complete immunity from war at the hand of his successor that they had looked for. Tsi-wang Arabtan was, however, the shadow of his brother and predecessor, and a dispute which arose with the Russians during his reign weakened his power in other directions. Little Bokhara was said to be rich in gold mines, and therefore became a coveted region in the eyes of the Russians. Under the vigorous administration of Peter the Great an expedition was despatched to force a passage into the desired province. To oppose this invasion the Kalmucks assembled, and after a protracted and undecided engagement the Russians were glad to agree to retire down the Irith and to give up all further advance. Tsi-wang Arabtan had seized the Kalmuck chief of Dzungaria. But, though to the ears these titles were as high-sounding as those of his predecessors, in reality the power they represented was curtailed by the presence of Chinese commissioners, in whose hands rested the real authority. The gallant weight of this state of dependence drove Amursama before long into revolt. He dispersed the Chinese garrison stationed in II (Kulja), killed the generals, and advanced his own forces as far as Palikun on the river III. To punish this revolt, K'ien-lung sent a large force into the rebellious province. As on the previous occasion, the
Chinese were everywhere victorious, and Amursama fled into Siberia, where he died of small-pox after a short illness.

While China was thus absorbing the Mongols within her reach, Russia was gathering within her borders those with whom she came into contact. Among these were the Buriats, who occupied a large territory on both sides of Lake Baikal. As usual in such cases, disputes arose out of disturbances on the frontier, and were ended by the Buriats and the neighbouring Mongol tribes becoming one and all tributary to Russia.

The dominions given by Jenghiz Khan to his son Jagatai were involved in the quarrels between Kaidu and Kublai for the khakanate, but at the beginning of the 14th century Dua, a great-grandson of Jagatai, made himself undisputed lord of the whole region. Shortly after Dua's death the Mongols of Eastern Turkestan, descendants of those who had favoured the pretensions of Kaidu to be khakan, separated from their western brethren and chose a son of Dua as their khan. Henceforth the Jagataids were divided into two dynasties, the western reigning at Samarkand, the eastern first at Kashgar and later at Yarkand and Aksu. Kazan (1343–1346) was the last independent khan of the western Jagataids; thereafter power fell into the hands of amirs, who, however, continued to place a titular khan on the throne. In 1356 Toghlu-Timur, a grandson of Dua and khan of the eastern Jagataids (the kingdom called by the Persians the Ilkhanate), invaded the western Jagataids. About this time Timur (q.v.), otherwise Timur-i-ling (Tamerlane), a young amir at the court of the western Jagataids, allied himself with the leaders who had dethroned Kazan, and after the death of Toghlu-Timur became by right of conquest khan of both sections of the Jagataids. After Timur's death the two sections again divided, while a third kingdom, Ferghana, was held by the Timurids (descendants of Timur). At the beginning of the 16th century all three dynasties were swept away by Mohammed Shaiban, head of the Uzbek Mongols (see infra, Uzbek).

The empire of the Ilkhanans established by Hulagu lasted nominally until 1353, but after the death of the Ilkhan Abu Said in 1335 the real power was divided between five petty dynasties which had been formed out of the provinces conquered by Hulagu. Meantime Islam had made great progress among the Mongols, the third Ilkhan, Nikudar Ahmed (reigned 1281–1284) having embraced that faith. The western frontiers of their empire bordering on the Syrian possessions of Egypt there was frequent intercourse, sometimes friendly, sometimes warlike, between the Ilkhanids and the sultans of Egypt (q.v.). Of the petty dynasties which supplanted that of the Hulagu, one known as the Jelairsids held Baghdad until about 1400. Another dynasty which reigned in Azerbaijan was overthrown in 1335 by the western Kipchaks (see infra, Golden Horde). Between 1369 and 1400 Timur had made himself master of the greater part of Persia and established there a second Mongol dynasty, which in turn gave place to that of the Ak Kuyunli (see Persia).

Of the Mongol tribes who became entirely subject to Russia the principal are those of the Crimea, of Kazan, and Astrakhan; of these the Tatars of Kazan are the truest representatives of the Golden Horde or western Kipchaks, who originally formed the subjects of Batu and Orda. Batu, whose victorious campaign in Russia has already been sketched, was finally awarded as his fief the vast steppes which stretch from the Carpathian Mountains to Lake Baksch. He fixed his headquarters on the Volga, and there set up his Golden Tent from which the Horde acquired the name of the Golden Horde. In 1255 Batu died and was succeeded by his brother Bereke Khan. During the reign of this sovereign the exactions which were demanded from the Russian Christians by the Mongols aroused the Christian world against the barbarian conquerors, and at the command of Pope Alexander IV. a general crusade was preached against them. But though the rage of the Christians was great, they lacked that united energy which might have availed them against their enemies; and, while they were yet breathing out denunciations, a Tartar host, led by Nogai and Tulbagha, appeared in Poland. After a rapid and triumphant march the invaders took and destroyed Cracow, and from thence advanced as far as Bytom (Beuthen) in Oppeln, from which point they eventually retired, carrying with them a crowd of Christian slaves. From this time the Mongols became for a season an important factor in European politics. They corresponded and treated with the European sovereigns, and intermarried with royal families. Hulagu married a daughter of Michael Palaeologus; Toktu Khan took as his wife Maria, the daughter of Andronicus II; and to Nogai Michael betrothed his daughter Irene. Toktu, the second khan in succession to Bereke, is the first Mongol ruler whom we hear of as having struck coins. Those issued during his reign bear the mint marks of Sarai, New Sarai, Bulgar, Ukek, Khwarizm, Kirim, Jullad and Madjar, and vary in date from 1297 to 1312.

The adoption of Islam by the rulers of the Golden Horde had as one result the drawing closer of the relations of the Mongols with Constantinople and Egypt. Embassies passed between the three courts, and so important was the alliance with the Mongols deemed by the sultan Nâşîr, ruler of Egypt, that he sent to demand in marriage a princess of the house of Jenghiz Khan. At his first request was refused by the proud Mongols, but the present of a million gold dinars, besides a number of horses and suits of clothes, was procured; he was married to his third wife, and in October 1356 the princess landed at Alexandria. Her reception at Cairo was accompanied with feasting and rejoicing, and the members of her escort were sent back laden with presents. With that religious toleration common to his race, Azzub Khan, having married one princess to Nâşîr, gave another in marriage to George the prince of Moscov. To protect the Russian churches within his territories, and put his seal to his new religious views by marrying a daughter of the Greek emperor, Andronicus III. He died in 1400, after a reign of twenty-eight years. His coins were struck at Sarai, Khwarizm, Moskoi, Bulgar, Azak and Kirim, and are dated from 1313 to 1340. To his son and successor, Timbog Khan, after a reign of only a few months, was married the second wife of Janibeg Khan, who usurped his throne, and, according to the historian of that time, proved himself to be “just, God-fearing, and the patron of the meritorious.” These excellent qualities did not, however, prevent his making a raid into Poland, which was conducted in the usual Mongol manner, nor did they save his countrymen from being decimated by the black plague. The throne Janibeg had seized by violence was, in 1357, snatched from him by violence. As he lay ill on his return from a successful expedition against Persia he was murdered by his son Berdebeg, who in his turn was, after a short reign, murdered by his son Kulpa. With the death of Berdebeg the fortunes of the Golden Horde began rapidly to decline. As the Uzbek proverb says, “The hump of the camel was cut off in the person of Berdebeg.”

But while the power of the Golden Horde was dwindling away, the White Horde or Eastern Kipchak, which was the inheritance of the elder branch of the family of Jui, remained prosperous and full of vitality. The descendants of Orda, Batu's elder brother, being far removed from the dangerous influences of European courts, maintained much of the simplicity and rigor of their nomad ancestors, and the throne descended from father to son with undiminished authority until the reign of Uru Khan (1560), when complications arose which changed the fortunes of the tribe. Like many other opponents of the Mongol rulers, Khan Tuli Khoga paid with his life for his temerity in opposing the political schemes of his connexion Uru Khan. Toktamish, the son of the murdered man, fled at the news of his
father's death and sought refuge at the court of Timur, who received him with honour and at once agreed to espouse his cause. With this intention he despatched a force against Urus Khan and gained some advantage over him, but, while fitting out another army to make a fresh attack, news reached him of the death of Urus. Only at Sighnak are coins known to have been struck during the reign of Urus, and these bear date from 1372 to 1375.

He was followed on the throne by his two sons, Tuktakia and Timur Malik, each in turn; the first reigned but for a few weeks, and the second was killed in a battle against Toktamish, the son of his father's enemy. Toktamish now (1378) seized the throne, not only of Eastern Kipchak but also of the Golden Horde, over which his arms had at the same time proved victorious. He reigned as Nasir-ed-din Jetal ed-Mahmud Ghujas Toktamish. His demands for tribute from the Russian princes met with evasions from men who had grown accustomed to the diminished power of the later rulers of the Golden Horde, and Toktamish therefore at once marched an army into Russia. Having captured Serpukhov, he advanced on Moscow. On the 23rd of August 1382 his troops appeared before the doomed city. For some days the inhabitants bravely withstood the constant attacks on the walls, but failed in their resistance to a surprise attack made on the city by the Moscow warriors. With astonishing celerity they opened the gates to the Mongols, who declared themselves the enemies of the grand-prince alone, and not of the people. The usual result followed. The Russian general, who was invited to Toktamish's tent, was there slain and at the same time the signal was given for a general slaughter. Without discriminating age or sex, the Mongol troops butchered the wretched inhabitants without mercy, and, having made the streets desolate and the houses tenantless, they first plundered the city and then gave it over to the flames. The same pitiless fate overtook Vladimir, Zvenigorod, Yuriev, Mozhashik and Dimitrov. With better fortune, the inhabitants of Pereslav and Kolomna escaped with their lives from the troops of Toktamish, but at the expense of their cities, which were burned to the ground. Satisfied with his conquests, the khan returned homewards, traversing and plundering the principality of Ryazan on his way.Flushed with success, Toktamish demanded from his patron Timur the restoration of Khwarizm, which he had fallen into by the death of his father and which was thus restored to the Golden Horde. Such a request was not likely to be well received by Timur, and, in answer to his positive refusal to yield the city, Toktamish marched an army of 90,000 men against Tabriz. After a siege of eight days the city was taken by assault and ruthlessly ravaged. In the meantime Timur was collecting forces to punish his rebellious protégé. When his plans were fully matured, he advanced upon Old Urgenj and captured it. More merciful than Toktamish, he transported the inhabitants to Samarkand, but in order to mark his anger against the rebellious city he levelled it with the ground and sowed barley on the site where it had stood. On the banks of the Oxus he encountered his enemy, and after a bloody battle completely routed the Kipchaks, who fled in confusion. A full followed this victory, but in 1390 Timur again took the field. To each man was given "a bow, with thirty arrows, a quiver, and a buckler. The army was mounted, and a spare horse was supplied to every two men, while a tent was furnished for every ten, and with this were two spades, a pickaxe, a sickle, a saw, an axe, an awl, a hundred needles, 8 lb of cord, an ox's hide, and a strong span." Thus equipped the army set forth on its march. After a considerable delay owing to an illness which overtook Timur his troops arrived at Kara Saman. Here envoys arrived from Toktamish bearing presents and a message asking pardon for his past conduct; but Timur was inexorable, and, though he treated the messengers with consideration, he paid no attention to their prayer. In face of innumerable difficulties, as well as of cold, hunger, and weariness, Timur marched forward month after month through the Kipchak country in pursuit of Toktamish. At last, on the 18th of June, he overtook him at Kandurcha, in the country of the Bulgars, and at once forced him to an engagement. For three days the battle lasted, and, after inclining now to this side and now to that, victory finally decided in favour of Timur. The Kipchaks were completely routed and fled in all directions, while it is said as many as 100,000 corpses testified to the severity of the fighting.

Toktamish, though defeated, was not subdued, and in 1395 Timur found it necessary again to undertake a campaign against him. This time the armies met upon the Terek, and after a fiercely-contested battle the Kipchaks again fled in confusion.

Timur, threatened by the advancing autumn, gave up further pursuit, and retired with a vast body of gold ingots, silver bars, pieces of Antioch linen and of the embroidered cloth of Russia, &c. On his homeward march southwards he arrived before Azak, which was then the entrepôt where the merchants of the east and west exchanged their wares. In vain the natives, with the Egyptian, Venetian, Genoese, Catalan and Basque inhabitants, besought him to spare the city. His answer was a command to the Moslems to separate themselves from the rest of the people, whom he put to the sword, and then gave the city over to the flames. Circassia and Georgia next felt his wrath, and, after a speech of six days, the central Caucasus was one and all destroyed. After these successes Timur gave himself up for a time to feasting and rejoicing, accompanied by every manifestation of Oriental luxury. "His tent of audience was hung with silk, its poles were golden, or probably covered with golden plates, the nails being silver; his throne was of gold, enriched with precious stones; the floor was sprinkled with rose water." But his vengeance was not satisfied, and, having refreshed his troops by this halt, he marched northwards against Astrakhan, which he utterly destroyed. The inhabitants were driven out into the country to perish with the cold, while the commander of the city was killed by being forced beneath the ice of the Volga. Sarai next shared the same fate, and, Timur, having thus crushed for the second time the empire of Toktamish, set out on his return home by way of Derbent and Azerbâdîjan.

The power in the hands of the successors of Toktamish never revived after the last campaign of Timur. They were constantly engaged in wars with the Russians and the Krim Tatars, with whom the Russians had allied themselves, and by degrees their power decayed, until, on the seizure and death of Ahmed Khan at the beginning of the 16th century, the domination of the Golden Horde came to an end.

The fate which thus overtook the Golden Horde was destined to be shared by all the western branches of the great Mongol family. The khans of Kazan and Kasimov had already in 1552 succumbed to the growing power of Russia, and the Krim Tatars were next to fall under the same yoke. In the 17th century, when the Krim Tatars first appear as an independent power, they attempted to strengthen their position by allying themselves with the Russians, to whom they looked for help against the attacks of the Golden Horde. But while they were in this state of dependence another power arose in eastern Asia which modified the political events of that region. In 1453 Constantinople was taken by the Osmanli Turks, who, having quarrelled with the Genoese merchants who monopolized the trade on the Black Sea, sent an expedition into the Crimea to punish the presumptuous traders. The power which had captured Constantinople was not likely to be held in check by any forces at the disposal of the Genoese, and without any serious opposition. Kaffa, Sudak, Balaklava and Inkerman fell before the troops of the sultan Mahommed. It was plain that, situated as the Crimea was between the two great powers of Russia and Turkey, it must of necessity fall under the direction of one of them. Which it should be was decided by the invasion of the Turks, who restored Mengi Girai, the deposed khan, to the throne, and virtually converted the khante into a dependency of Constantinople. But under than tutelage of Turkey, Mengi Girai, whose leading policy seems to have been
the desire to strengthen himself against the khan of the Golden Horde, formed a close alliance with the grand-prince Ivan of Russia. One result of this friendship was that the Mongols were enabled, and encouraged, to indulge their predatory habits at the expense of the enemies of Russia, and in this way both Lithuania and Poland suffered terribly from their incursions. It was destined, however, that in their turn the Russians should not escape from the marauding tendencies of their allies, for, on pretext of a quarrel with reference to the succession to the Kazan throne, Mahommed Girai Khan in 1531 marched an army northwards until, after having devastated the country, massacred the people, and desecrated the churches on his route, he arrived at the heights of Vorobeiv overlooking Moscow. The terror of the unfortunate inhabitants at the sight once again of the dreaded Mongols was extreme; but the horrors which had accompanied similar past visitations were happily averted by a treaty, by which the grand-prince Basili undertook to pay a perpetual tribute to the Krim khans. This, however, proved but a truce. It was impossible that an aggressive state like Russia should live in friendship with a marauding power like that of the Krim Tatars. The primary cause of conflict was the attempt of the latter to avenge itself on the Russian khans who had expelled the Mongols, and lost again to Russia with that of Astrakhan in 1555. The sultan, however, declined to accept this condition of things as final, and instituted Devlet Girai, the Krim khan, to attempt their recovery. With this object the latter marched an army northwards, where, finding the road to Moscow unproctected, he pushed on in the direction of that ill-starred city. On arriving before its walls he found a large Russian force occupying the suburbs. With these, however, he was saved from an encounter, for just as his foremost men approached the town a fire broke out, which, in consequence of the high wind blowing at the time, spread with frightful rapidity, and in the space of six hours destroyed all the churches, palaces and houses, with the exception of the Kremlin, within a compass of 30 miles. Thousands of the inhabitants perished in the flames. "The river and ditches about Moscow," says Horsey, "were stopped and filled with the multitudes of people, laden with gold, silver, jewels, chains, ear-rings and treasures. So many thousands were there burned and drowned that the river could not flow in their two lowermost terraces, and the dejection with the destruction he had indirectly caused, and unwilling to attack the Kremlin, the khan withdrew to the Crimea, ravaging the country as he went. Another invasion of Russia, a few years later (1572), was not so fortunate for the Mongols, who suffered a severe defeat near Molodi, 50 versts from Moscow. A campaign against Persia made a diversion in the wars which were constantly waged between the Krim khan and the Russians, Cossacks and Poles. So hardly were these last pressed by their pernicious enemies in 1649 that they bound themselves by treaty to pay an annual subsidy to the khan. But the fortunes of war were not always on the side of the Tatars, and with the advent of Peter the Great to the Russian throne the power of the Krim Mongols began to decline. In 1690 the tsar supported by a large Cossack force under Mazeppa, took the field against Selim Girai Khan, and gained such successes that the latter was compelled to cede Azov to him. By a turn of the wheel of fortune the khan had the satisfaction in 1711 of having it restored to him by treaty; but this was the last real success that attended the Krim arms. In 1735 the Russians in their turn invaded the Crimea, captured the celebrated lines of Perekop, and ravaged Bakhchi-sarai, the capital. The inevitable fate which was hanging over the Krim Tatars was now being rapidly accomplished. In 1783 the Krim, together with the eastern portion of the land of the Nogais, became absorbed into the Russian province of Taurida.

The Uzbegs.

The Uzbegs, who, on the destruction of the Golden Horde, assumed an important position on the east of the Caspian Sea. The founder of their greatness was the khan Abulkhair, who reigned in the 15th century, and who, like another Jenghiz Khan, consolidated a power out of a number of small clans, and added lustre to it by his successful wars. Shahbani Khan, his grandson, proved himself a worthy successor, and, by his Babi (q.v.), the Timurid Khan of Persia, who afterwards founded the Mogul Empire in India, was driven from his ancestral dominions. In 1500 he inflicted a severe defeat on Baber's forces, and captured Samarkand, Herat, and Kandahar. By these and other conquests he became possessed of all the country between the Oxus and the Jaxartes, of Ferghana, Khwarizm and Hisar, as well as of the territory of Tashkent from Kashgai to the frontiers of China. In the following year, by a dashing exploit, Baber recovered Samarkand, but only to lose it again a few months later. During several succeeding years Shahbani's arms proved victorious in many fields of battle, and but for an indiscreet outrage on the territories of the shah of Persia he might have left behind him a powerful empire. The anger, however, of Shah Ismail roused against him a force before which he was destined to fall. The two armies met in the neighbourhood of Merv, where, after a desperate encounter, the Uzbegs were completely defeated. Shahbani, with a few followers, sought refuge in a cattle-pound. But finding no exit on the farther side, the refugees tried to leap over the fence, Baber remained behind. In this attempt Shahbani was killed (1510). When his body was recognized the infuriated enemy cut off the head and presented it to the shah, who caused the skull to be mounted in gold and to be converted into a drinking-cup. After this defeat the Uzbegs withdrew across the Oxus and abandoned Khorasan. Farther east the news aroused Baber to renewed activity, and before long he reoccupied Samarkand and the province "Beyond the River," which had been dominated by the Uzbegs for nine years. But though the Uzbegs were defeated they were by no means crushed, and ere long we find their khans reigning, now at Samarkand, and now at Bokhara. As time advanced and European powers began to encroach more and more into Asia, the history of the khanates ceased to be confined to the internecine struggles of rival khans. Even Bokhara was not beyond the reach of Russian ambition and English diplomacy. Several European envoys found their way thither during the first half of the 19th century, and the murder of Stoddart and Connolly in 1842 forms a melancholy episode in British relations with that fanatical capital. With the absorption of the khanate of Bokhara by Russia in 1885, the nature of the Mongol tribes in Central Asia changed. "The day, when their name has left its imprint only on the dreary stretch of Chinese-owned country from Manchuria to the Altai Mountains, and to the equally unattractive country in the neighbourhood of the Koko-nor."

Howorth, History of the Mongols (1876, 1878); D'Ohsson, Histoire des Mongols (1834); Cahun, Introduction à l'histoire d'Asie; Köhler, Die Entwicklungen des Kriegswesens; Krokow-Grossmann, Ergebnisse der Mongol im Mittel-Europa; (for the general reader) Jeremiah Curtin, The Mongols, a history (R. K. D)

Language.—The Mongol tongue is one of the members of the Altaic stock which recent scholars designate as Ural-Altaic, which also includes the Finno-Ugrians, Turkish, Manchus and Samo-Yede. The members of this group are not so closely related to one another as those of the Indo-European stock; but they are all bound together by the common principle of agglutinative formation, which is characteristic of the so-called "Uralic" languages, the general structure, and also by certain common elements in the stock of roots which run through them all, or through particular more closely-connected families within the group. The fatherland proper of the Mongol is Mongolia (q.v.). The sum total of the Mongol population under Chinese government is calculated at between two and three millions.

Generally the whole Mongol tribe may be divided into three branches, the East Mongols, West Mongols and Buratais.

1. The East Mongols are divided into the Kalkas in the borders just mentioned, the Shara Mongols south of the Gobi along the Great Wall north-eastward to Manchuria, and lastly the Shiragol or Shariagol in Tangut and in northern Tibet.

2 Compare W. Schott, Versuch über die tatarischen Sprachen (Berlin, 1856; Ueber das altaische oder finnisch-tartarschen Sprachengeschlecht (Berlin, 1849); Alte und neuen Stidten, parts i.—v. (Berlin, 1860–1870); and A. Castrén, Ethnologische Vorlesungen über die Altanschen Völker, ed. by A. Schiefer (St Petersburg, 1857).
2. On the signification and employment of the different names of the West Mongols (Kalmucks, Oelöd, Oral, or Dorbör Oirad—the four Oirad, Mongol Oirad), and also as regards the subdivision of the tribes, there is much uncertainty. The name Kalmuck, so generally employed among us, is in fact not an original Mongol name, and must therefore have been taken by the Volga Kalmucks (Kalmak), but even with them the name is not common, and almost a byname. It is of foreign origin, and most likely a Tartaric word which has yet to be explained. Oirad means the "near ones," the 'related'.

The usual explanation given is that the name came into general use in the sixteenth century, and that it was derived from the word "Oirat," which originally signified the Mongol influence; as, in the modern Turkish, a favorite term for Mongol is "Oirad."—hence Mongol Oirad, "the Mongol related tribe." This is the favourite name among Kalmucks, Dorbör Oirad, in the four related tribes, comprise (1) Dzungars, (2) Torgols, (3) Oskhols, (4) Derbets. The Torgols inhabit the eastern part of the territory Semiryetischen (Kulja) and Semipaltyatsin 34,000, while in the southern part of the government Tomsk, on the Altai, the Kalmuck population amounted formerly to 19,000.

Beside these, a large number is found on the east, west, on the banks of the Volga (near Astrakhan). From their original seats in Dzungaria they turned in their migrations to the north, crossed the steppe of the Kirghiz, and thus gradually reached the Buriats in the lower Ob, and at length settled in the country of the Buriats. These Torgols settled in 1616; thence they crossed the Volga in 1650, and took possession of the now so-called steppe of the Kalmucks, being followed in 1673 by the Derbets and in 1678 by the Koshols.

In 1711 a considerable number returned to the Chinese empire. There is still some confusion in the name, for there are two Kalmucks, which extends between the Caspian and the Volga in the east, and from the town of Sarepta in the north to the Kuma and the Marych in the south. According to modern practice, the Kalmucks, who live on the Volga, are called Dörbör Oirad, while the Kalmucks, who live on the Caspian, are called Torgols. To these we have to add 25,000 more on the borders of the Cossacks of the Don, and lastly 8000 in the bordering provinces of Orenburg and Saratow.

In the southern part of the Russian province of Irkutsk, in a wide circle round Lake Baikal, lies the heidrom proper of the Buriats, which they also call the "Holy Sea."; the country east of the lake is commonly called Transbaikalia. Their country practically begins at the Caspian, and the lands divided almost parallel lines to the north, to the town Kirensk on the Lena, and from the Onon in the east to the Oka, a tributary of the Angara, in the west, and still farther west towards Nizhni-Udinsk. They are most numerous beyond the Baikal Lake, and the Kalmucks of Transbaikalia and those of Nertchian.

These Transbaikalian Buriats came to these parts only towards the end of the 17th century from the Kalkas. While Mongols and Kalmucks generally continue to live after the usual fashion of nomads, we find here agricultural pursuits, most likely, however, due mainly to Russian influence. Christianity is also making its way. The sum total of the Buriats amounts to about 250,000.

2. Another tribe separated from the rest of the Mongols is the so-called Hazara (the thousand), and the four aimak (tribes), who wander about as herdsmen in Afghanistan, between Herat and Kabul. In external characteristics they are Mongols, and in all probability they are the remains of a tribe from the time of the Mongol dominion. The principal difference of the Hazara is that the name is strictly Mongolian, more particularly West Mongolian or Kalmuck, as has been proved by H. C. von der Gabelentz 1.

Agreedly with this, this thirdfold division of the Mongols we have also a thirdfold division of their respective languages: (1) East Mongol or Mongolian proper, (2) West Mongolian or Kalmuck, (3) Buriat.

The dialects just mentioned are found to be in close relation to each other when we examine their roots, inflections and grammatical structure; and it is the same in all the dialects of the group, whoever understands one of them understands all. Phonetically a characteristic of them all is the "harmony of vowels," which are divided into two chief classes: a) a, o, u and the soft e, ö, ö, between which there is a slight difference; and b), the hard a, o, u, and the soft e, ö, ö, between which there is a certain amount of difference, the latter being more similar to the former. The consonants preceding the vowels are equally under their influence.

The Mongol dialects, which in a slightly altered form are also in use among the Manchus, are written perpendicularly from right to left, each line being divided into rows. Their alphabet having signs for seven vowels—a, å, e, i, o, û, ü, and diphthongs derived from them—aö, ai, ei, io, ou, ûö, and for seventeen consonants—h, k, g, k, m, r, w, (never initial), t, d, y, s, ts, ss, sh, w. All these are modified in shape according to their position, and new letters are formed by the union of two or more. In these there are certain rules, and particular orthographic rules. In Mongolian and Manchu writing the syllable (i.e., the consonant together with the vowel) is considered as a unit, in other words a syllabarium rather than an alphabet. The existing Chinese and Manchu script is the one in use in the Manchu language, which was themselves derived from the Syriac, having been brought to the Uighurs by Nestorian missionaries. An Indian and Tibetan influence may also be noticed, while the arrangement of the characters follows the usual Chinese fashion. The Mongol alphabet was brought into its present shape by the learned Lamas Saksaya Pandita, Phags-pa Lama, and Tsholto-ndi-Otser in the 15th century 2, but is exceedingly imperfect. To express the frequently-occurring "a"-words borrowed from Sanskrit and Tibetan, which are wanting in the Mongol alphabet, a special alphabet called Gallig, is employed. Every one who has tried to read Mongol knows how many difficulties have to be overcome, arising from the ambiguity of certain letters, or from the fact that the same sign is to be pronounced in two different ways. In these there are no means for distinguishing the o, å, and û, the consonants k and k, t and d, y and s (ds). A and e, o and å, å, e and i, n, g and kh, t and d, and on, are liable to be mistaken for each other. Other differences are also very considerable.

chain; M. zorkh, "heart;" B. chedh. K. in the beginning or middle of a word is always alwys.

The noun is declined by the help of appended particles, viz. Gen. yin, u, un; Dat. das, a; Acc. yu, i; Ablative, turr. As the accusative have also some special forms which have at the same time a possessive sense, Dat. dagan, degen; Accus. ben, yen. The plural is expressed by affixes (nar, oder, ss, a), or frequently by words of plurality, all "many," e.g. khar (string), khar nara (strings). "Comparative" consists of the same endings in singular and plural. Gender is not indicated. The adjective is inflected both as attribute and as predicate; there is no comparative form, this idea being expressed by the construction: the genitive of the noun: the adjective is the comparative. There are bi, 1; tfch, thou; bida, we; ta, ye; their genitives serve as posses- sive. The demonstratives are ene, ire (this, that), plural ede, ede; interrogative ken, who? The relative is lacking, and its place is taken by the use of a particle of the form lu (or luo, lu, etc.); the theme of the verb is seen in the imperative, as bari, grasp. The conjuncts are rich in forms for tense and mood, but the person and number are with few exceptions few. The present is formed from the past participle by adding mar (harma), the preterite by the genitive in -saro or -saro (barbasar, barbasari) of the preterite. It is in the third person singular beyond. The future has the same form as the present (barabari, 1st pers.)," in the preterite it is formed in -saro (barbargad); the present part, has kichi (barakichi), the past part, kasan (barikasan); the supine ends in -i, the infinitive in khan (baru), and the gerund in khal (barali). All these forms are perfectly regular conjugation, and derivative forms, derived from the theme by inflexes, are conjuncted on the same scheme. Thus the passive has in the, ka or kalo (barikalka), to be grasped, the causative has ink, or kalo (barikalka), co-operative or obligatory oritive ika or loka (barakalka), grasp together.

There are no prepositions, only postpositions. Adverbs are either simple particles (affirmative, negative, interrogative, modal, etc.) or pronouns (in the plural), frequently formed from nouns and adjectives, and few very few conjunctions; the relations of clauses and sentences are mainly indicated by the verbal forms (part., sup., conditional, but mainly by the gerund).

The use of conjunctions and sentences in construction is pretty much the opposite of that which we follow. In a simple sentence the indication of time and place, whether given by an adverb or a substanti- postposition, always comes first; then comes the subject, always preceded by its adjectival or genitive, then the object and the verbal. With the preterite the subject is followed by a particle preceded by any adverb that belong to it. So in the structure of a period all causal, hypothetical, concessive clauses, which can be conceived as preceding the main predication in point of time, or even of events, that peradventure must be counted as a regular construction, but the finite verb appears only at the end of the main predication or apodosis. The periods are longer than in any other language; a single one may fill several pages. The verb in a sentence may be divided according to the three dialects. For East Mongolian, I. J. Schmidt gave the first grammar (St Petersburg, 1831), and a Mongolian-Russian dictionary (St Petersburg, 1835). Next Jos. Koval- evski published in Russian a Mongolian grammar (Kaslan, 1836-57), and his great Dictionnaire mongol-ruisse-français (3 vols., Kaslan, 1834-1846, 1849). We may mention K. Yuille, Short Mongol Grammar (in Mongol), xyloro- graphically printed from Typescript of the present writer (1838). A. Bobrovnikov's Russian Grammar of the Mongolian-Kalmuck Language (Kaslan, 1839) is very good. An admir- Schmidtmann's work is C. Puini, Elementi della grammatica mongola (Gottingsen, 1839). A. A. Zwick (s. i. et al.) autographed at Donaueschingen (1851). Zwick's autographed Kalmuck and German dictionary with a printed German index (von der Osthof, 1852). For the Kalmucks in Kaslan the tales of Siddhi-kur (Leipzig, 1866) gives a complete glossary to these stories. There are small Russian and Kalmuck vocabularies by P. Smirnow (Kaslan, 1857) and C. Goostonskiy (St Petersburg, 1860). For the Kalmuck, printed books and MSS. are in the Asiatic Museum of the St Petersburg Academy, and in the libraries of Kazan and Irkutsk; there is also a good collection in the royal library at Dresden. Consult in general P. S. Pallas, Sammlungen historischer Nachrichten u. d. mongolischen Volkerkens (2 vols., St Petersburg, 1876-1880); I. J. Schmidt, Forschungen im Gebiete der älteren mongolischen Sprache, 3 vols., Berlin, 1869; and W. von der Osthof, Mongolische Sprachen; Geschichte der Sprachne- schaften (1877-1880); B. Jürgen, in the "On the Present State of Mongolian Researches," Journ. R. As. Soc., 1882, pp. 42-65.

MONG PAI (called Moby by the Burmese), the most west-erly of the British Shan States of Burma. It has an approxi- mate area of 1000 sq. m., and a population (1901) of 10,351. The general character of the country is hilly, rising westwards in a gentle slope from the chief stream, the Nam Hpiu or Balu.
This is navigable for native boats throughout the year to the point where it sinks underground in Karen-ni. The chief cultivation is rice, with about two acres of dry or hill rice to one of wet bottom. The hill fields are left fallow for ten years after two years' cultivation. The chief, the Sawbwa Hkun Yon, held charge through the reigns of four Burmese kings, and submitted early in 1887 on the first arrival of British troops. He abdicated in favor of his son in 1890, and died a few years later.

MONG PAN (the Burmese Maingpan), a state in the eastern division of the southern Shan States, lying approximately between 19° 45' and 20° 25' N. and between 98° and 99° E., with an area of 2,290 sq. m., and a population (1901) of 16,629. The main state lies, except for a few insignificant cities, entirely west of the Salween, but beyond that river are the four sub-fududatory states of Mông Tun, Mông Hang, Mông Kyawt and Mông Hta. The only considerable area of flat land is round the capital, which lies in a large and fertile plain, marking roughly the centre of the state. From this plain rise on all sides low hills covered with scrub jungle, sloping up to ranges of about 5,000 ft. on nearly every side. Rice is the only crop, irrigated where possible; elsewhere dry cultivation prevails. The state has valuable teak forests on both sides of the Salween, which cover a considerable but undetermined area. The general altitude of the valleys is about 2,000 ft. The capital is small, and has only about 200 houses. The chief is of Sawbwa rank.

MONGREL (earliest form mongrel, probably from the root meng, or mong-, to mix, cf. mingle, among), a dog that is the progeny of two different breeds, or one whose breed it is impossible to tell on account of the various crossings. In the case of other animals or plants it is the result of a fertile cross between two varieties of the same species, and so to be distinguished from a "hybrid," the result of a fertile cross between two distinct species (see HYBRIDISM).

MONIER-WILLIAMS, SIR MONIER (1819-1890), British orientalist, son of Colonel Monier-Williams, survey-general in the Bombay presidency, was born at Bombay on the 12th of November 1819. He matriculated at Oxford from Balliol College in 1837, but left the university on receiving in 1839 a nomination for the East India Company's civil service, and was completing his course of training at Haileybury when the entreaties of his mother, who had lost a son in India, prevailed upon him to resign his nomination and return to Oxford. As Bachelor of Arts, he entered University College and, devoting himself to the study of Sanskrit, he gained the Boden scholarship in 1843. After taking his degree he was appointed professor of Sanskrit, Persian and Hindustani at Haileybury, where he remained until the abolition of the college upon the transfer of the government of India from the Company to the Crown. He taught oriental languages at Cheltenham for ten years, and in 1860 was elected Boden professor of Sanskrit at Oxford after a contest with Professor Max Müller (q.v.), which attracted great public interest and severe criticism, the motive of the non-resident voters, whose suffrages turned the scale, being notoriously not so much to put Monier-Williams in as to keep Max Müller out. Although, however, far inferior to his rival in versatility and literary talent, Monier-Williams was in no way inferior in the special field of Sanskrit, and did himself and his professorship much honour by a succession of excellent works, among which may especially be named his Sanskrit dictionary; his Indo-Aryan Language (1875), an anthology from Sanskrit literature; and his translation of Sakkudala (1876). In his later years he was especially attracted by the subject of the native religions of India, and wrote popular works on Brahmanism, Buddhism and Hinduism. His principal undertaking, however, was the foundation of the Indian Institute at Oxford, which owes its existence entirely to him. He brought the project before the university in May 1875, and in that year and the following, and again in 1883, visited India to solicit the moral and financial support of the native princes and other leading men. Lord Brassey came to his aid with a donation of £30,000, and in November 1880 the institute was adopted by the university, but the purchase of a site and the erection of a building were left to the professor. Upwards of £30,000 was eventually collected; the prince of Wales, in memory of his visit to India, laid the foundation stone in May 1883; and the edifice, erected in three instalments, was finally completed in 1886. Ere this, failing health had compelled Monier-Williams to withdraw from the active duties of his professorship, which were discharged by the deputy-professor, Dr A. Macdonnell, who afterwards succeeded him. He continued, nevertheless, to work upon Sanskrit philology until his death at Cannes on the 11th of April 1890. He had been knighted in 1886, and was made K.C.I.E. in 1889, when he adopted his Christian name of Monier as an additional surname.

MONISM (from Gr. monos, alone), the philosophic view of the world which holds that there is but one form of reality, whether that be material or spiritual. The aim of knowledge is explanation, and the dualism or pluralism which arises in recognizing two or more wholly disparate forms of reality has in so far renounced explanation (see DUALISM). To this extent monism is justified; but it becomes mischievous if it prompts us to ignore important differences in facts as they present themselves to our intelligence. All forms of monism from Plotinus downwards tend to ignore personal individuality and volition, and merge all finite existence in the featureless unity of the Absolute; this, indeed, is what inspires the passion of the protest against Dualism. Turning to the epistemological premises we may class Plotinus the mystical monist: he attains to the One which is the All by an act of mystic union raising him above the phenomenal sphere. Spinoza is a materialist monist with an inconsistent touch of mysticism and a certain concession, more apparent than real, to the spiritual side of experience. Hegel's is an intellectualist monism, explaining matter, sensation, personal individuality and will as forms of thought. The doctrine of Schopenhauer and von Hartmann is a monism of cosmic will which submerges the individual no less completely than Hegelianism, though in a different manner. Haecckel's monism is mere materialism dignified by a higher title. Those who maintain that all these forms of synthesis are hasty and superficial stand by the conviction that the right philosophic attitude is to accept provisionally the main distinctions of common sense, above all the distinction of personal and impersonal; but to press forward to the underlying unity so far as experience and reflection justify.

MONITION, or ADMONITION (Lat. monere, to admonish), in English ecclesiastical law, an order requiring or admonishing the person complained of to do something specified in the monition, or appear and show cause to the contrary, "under pain of the law and penalty thereof." It is the lightest form of ecclesiastical censure, whether to clergymen or laity, but disobedience to it, after it has been duly and regularly served, entails the penalties of contempt of court. Monitions of a disciplinary character are either for the purpose of enforcing residence on a benefice, or in connexion with suits to restrain ritual alleged to be unlawful.

MONITOR (from Lat. monere, to warn, advise), an advisor or counsellor, one who warns another person as to his course of action, also used of things that are more or less personified, as conscience. The word is chiefly applied to senior pupils (also known as "prefects") in some of the great secondary schools in England; in America to senior students in certain colleges to whom the due of the degree was assigned, particularly that of keeping order; and also to pupil teachers in English elementary schools. It is used in a general way of anything that gives warning, and in this sense is applied to a lizard of the family Monitoridae, or Varanidae, found in Africa and Australia, which is supposed to give warning of the approach of crocodiles. The name of monitor was also given to a particular kind of ironclad invented for the American navy by Captain John Ericsson (q.v.) in 1862, which had a very low freeboard and revolving gun-turrets. The letter of Ericsson to the assistant secretary of the navy, of the 20th of January 1862 (quoted in the Century Dictionary), gives the inventor's reason for the name. "The impregnable and aggressive character of this structure will admonish the leaders of the Southern Rebellion that the batteries on the banks
of their rivers will no longer present barriers to the entrance of the Union forces. The ironclad intruder will thus prove a severe monitor to those leaders. "Downing Street" will hardly view with indifference this last 'Yankee notion,' this monitor." It is also the name of an ironclad railroad truck used for carrying a big gun. In America the raised part of the roof of a railroad carriage or omnibus in which the lights or ventilators are placed is known as a monitor roof or top. In mining the word is applied to a jointed nozzle which may be turned in all directions, and is used in hydraulic mining.

**MONK, GEORGE**

(or MONCK), GEORGE, 1ST DUKE OF ALBEMARLE (1608–1669), second son of Sir Thomas Monk, a gentleman of good family but in embarrassed circumstances, was born at Potheridge, near Torrington, in Devonshire, on the 6th of December 1608. Having thralled the under-sheriff of the county in revenge for a wrong done to his father, he had to leave home, and naturally took to the career of arms. He served as a volunteer in the expedition to Cadiz, and the next year did good service at the Isle of Róshe. In 1629 Monk went to the Low Countries, then the school of war, and there he gained a high reputation as a leader and disciplinarian. In 1638 he threw up his commission in consequence of a quarrel with the civil authorities of Dordrecht, and came to England. He obtained the lieutenant-colonelcy of Newport's regiment. During the operations on the Scottish border he showed his skill and coolness in the dispositions by which he saved the English artillery at Newburn, though himself destitute of ammunition. At the outbreak of the Irish rebellion he was appointed colonel of Lord Leicester's regiment. All the qualities for which he was noted through life—his talent of making himself indispensable, his imperturbable temper and his impenetrable secrecy—were fully displayed in this employment. The governorship of Dublin was vacant, and Monk was appointed by Leicester. But Charles I. overruled the appointment in favour of Lord Lambert, and Monk with great shrewdness gave up his claims. Ormonde, however, who was engaged with suspicion as one of the two officers who refused the oath to support the Royal cause in England, sent him under guard to Bristol. But he justified himself to Charles in person, and his soldierly criticisms on the conduct of the Irish War impressed the king, who gave him a command in the corps sent over from Ireland during the English Civil War. Monk was, however, soon taken prisoner, at Nantwich (1644), and spent the next two years in the Tower, where he found it difficult to live owing to his want of means. The king himself sent him £100, a gift for which Monk himself was sincerely grateful. He begged his imprisonment by writing his Observations on Military and Political Affairs.

Monk's Irish experience, however, led to his release and an invitation to take service in the parliament's army against the Irish rebels. Making a distinction like other soldiers of the time between fighting the Irish and taking arms against the king, he accepted the offer and took the covenant. At first as adjutant-general to Lord Leitrim, and afterwards as governor of Ulster, he rendered great services to his new masters. In conjunction with Colonel Michael Jones, governor of Leinster, he made head against the rebels for two years, but in the third (1649) the Parliamentarians, weakened by defections brought about by the execution of the king, were no longer able to keep the field. Losing one strong place after another, Monk concluded an armistice with the rebel Owen Roe O'Neill upon terms which he knew the parliament would not ratify. The convention was indeed a military expedient to deal with a military necessity, and although most of his army went over to the Royalist cause, he himself remained faithful to his employers and returned to England. As he expected, parliament "utterly disapproved" of the armistice but exonerated their general. His next service was in Cromwell's army in Scotland. He commanded a brigade at the great victory of Dunbar, and afterwards captured a number of small places. When in 1651 Cromwell with the field army hurried southward into England to bring the invading Scots to battle, Monk was left behind to complete the subjugation of the country. In February 1652 he left Scotland to recover his broken health at Bath, and in November of the same year he became an admiral, or rather a "general at sea," instead of a soldier. Ten days after hoisting his flag for the first time he was engaged with his colleagues, Blake and Deane, in the battle of Portland (Feb. 18, 1653). In the action of June 2–3 Monk exercised the general command after Deane's death. A third battle followed on the 29th and 30th of July, which was a decisive victory for the Commonwealth's fleet (see DUTCH WARS). On his return he married Anne Clarges, a woman of low extraction, often supposed to have been his mistress, "ever a plain homely dowdy," says Pepys, who, like other writers who mention her, is usually still less complimentary. Next year he was back in Scotland, methodically beating down a Royalist insurrection in the Highlands, and when this service was over settled down to a steady government of the country for the next five years. The timely discovery of a plot fomented by Overton, his second in command, in 1654, gave him an excuse for thoroughly purging his army of all Anabaptists, Fifth Monarchy men, and other dangerous enthusiasts. It is improbable that at this time Monk had proposed to himself the restoration of the king; though so astute a diplomatist must have weighed the chances of such an event. His very reticence, however, caused alarm on one side and hope on the other. In 1655 he received a letter from Charles II., a copy of which he at once sent to Cromwell, who is said to have written to him in 1657 in the following terms: "There be that tell me that there is a certain cunning fellow in Scotland called George Monk, who is said to dye in wait there to introduce Charles Stuart; I pray you, use your diligence to apprehend him, and send him up to me." Monk's personal relations with Cromwell were those of sincere friendship on both sides.

During the confusion which followed Cromwell's death Monk remained silent and watchful at Edinburgh, careful only to secure his hold on his troops. At first he contemplated armed support of Richard Cromwell, but gave up this idea on realizing the young man's incapacity for government, and renewed his waiting policy. In July 1659 direct and tempting proposals were again made to him by the king. His brother Nicholas, a clergyman, was employed by Sir J. Greville to bring to him the substance of Charles's letter. No bribe, however, could induce him to act one moment before the right time. He bade his brother go back to his books, and refused to entertain any proposal. But when Booth rose in Cheshire for the king, so tempting did the opportunity seem that he was on the point of joining forces with him, and a manifesto was prepared. His habitual caution, however, induced him to wait until the next post from England, and the next post brought news of Booth's defeat.

For a moment he thought of retiring into private life, but soon Fleetwood and Lambert declared against the parliament, and to their surprise Monk not only refused to join them, but (Oct. 23, 1659) at once took measures of active opposition. Securing his hold on Scotland by a small but trusty corps of old soldiers, he crossed the border with the rest of his army. Holding Lambert in play without fighting until his army began to melt away for want of pay, Monk received the commission of commander-in-chief of the parliament's forces (Nov. 24). The navy, some of the English garrisons and the army in Ireland declared for the parliament, and the army from Scotland crossed the Tweed on the 2nd of January 1660. It was inferior in number, but in all other respects superior to Lambert's, and Monk slowly marched on to London, disbanding or taking over on his way the detachments of Lambert's army which he met, and entered the capital on the 3rd of February. In all this his ultimate purpose remained mysterious. At one moment he secretly encouraged the demands of the Royalist City of London, at another he urged submission to the existing parliament, then again he refused to swear an oath abjuring the house of Stuart, and further he hinted to the attenuated Long Parliament the urgent necessity of a dissolution. Lastly, acting as the stern military agent of the infuriated parliament, he took up the gates and portcullises of the city. This angered not only the
MONK, J. H.—MONKS WELL

724

citizens but his own army, and gave him the lever that he desired to enforce the dissolution of parliament, while at the same time enabling him to break up as a matter affecting discipline, the political camarillas that had formed in his own regiments. He was now master of the situation, and though he protested his adherence to republican principles, it was a matter of common knowledge that the new parliament, which Monk was imposing on the remnant of the old, would have a strong Royalist colour. Monk himself was now in communication with Charles II., whose Declaration of Breda was based on Monk's recommendations. The new parliament met on the 25th of April, and on the 1st of May voted the restoration of the monarchy.

With the Restoration the historical interest of Monk's career ceased. Soldier as he was, he had played the difficult game of diplomacy with incomparable skill, and had won it without firing a shot. That he was vicius sine sanguine, as the preamble of his patent of nobility stated, was felt by every one to be the greatest service of all. He was made gentleman of the bedchamber, knight of the Garter, master of the horse and commander-in-chief, raised to the peerage with the titles of Baron Monk, earl of Torrington and duke of Albemarle, and had a pension of £7000 a year. But though his own career was complete, which he was the idol, and of which the last service was to suppress Venner's revolt, he was a person not to be displeased. But he entirely concurred in its disbandment, and only the regiment of which he was colonel, the Coldstream (Guards), survives to represent the army of the Civil Wars. In 1664 he had charge of the admiralty when James, duke of York, was in command of the fleet, and when in 1665 London was deserted on account of the plague, Monk, with all the readiness of a man accustomed to obey without thinking of risk, remained in charge of the government of the city. Once more, at the end of this year, he was called upon to fight, having a joint commission with Prince Rupert against the Dutch. The whole burden of the preparations fell upon him. On the 23rd of April 1666 the admirals joined the fleet, and on the 1st of June began the great four days' battle, in which Monk showed not only all his old coolness and skill, but also a reckless daring which had seemed hitherto foreign to his character. Later in the same year he maintained order in the city of London during the Great Fire. His last entry was in 1667, when the Dutch fleet sailed up the Thames, and Monk, though ill, hastened to Chatham to oppose their farther progress. From that time he lived much in privacy, and died of dropsy on the 3rd of January 1670, "like a Roman general with all his officers about him." The dukedom was extinct on the death of his son Christopher, 2nd duke of Albemarle (1653–1688).

See the Life of Monk, by Dr Gumble, his chaplain (London, 1671), and the memoir and bibliography by C. H. Firth in the Dict. Nat. Biog.

MONK, JAMES HENRY (1784–1836), English divine and classical scholar, was born at Buntingford, Herts. He was educated at Charterhouse School and Trinity College, Cambridge, and in 1809 was elected professor of Greek in succession to Porson. The establishment of the classical tripos was in great measure due to his efforts. In 1822 he was appointed dean of Peterborough; in 1830, bishop of Gloucester (with which the see of Bristol was amalgamated in 1836). He is best known as the author of a Life of Bentley (1830) and as the editor (with C. J. Blomfield) of Porson's Adversaria (1812).

MONK, MARIA (c. 1817–1850), an adventuress and impostor, who, coming to New York in 1835, claimed to have escaped from the Montreal nunnery of the Hôtel Dieu, concerning which, and the practices prevalent there, she circulated sensational charges in Awful Disclosures by Maria Monk (1836). Over 200,000 copies of this book and a sequel were sold, and a violent anti-Catholic agitation resulted. She was finally exposed as a woman of bad character, and her story proved to be absolutely false, but not until she had deceived many people of good standing.

MONK (O.Eng. monuc; this with the Teutonic forms, e.g. Du. monnik, Ger. Mönch, and the Romanic, e.g. Fr. moine, Ital. monaco and Span. monje, are from the Lat. monachus, adapted from Gr. μοναχος, one living alone, a solitary; μονος, alone), a member of a community of men living a life under vows of religious observance; the term is properly confined to a member of a Christian community, but is sometimes applied to members of Buddhist and Mahommedan religious brotherhoods. The Greek and Latin name was first used of the hermits, but was early widened to embrace the coenobites. The term "monk" should not be used either of "friars" or of "canons regular." (See Monasticism.)

MONKEY, a term apparently applicable to all members of the order Primates (q.v.) except man and perhaps the larger apes. In zoology it may be used in this wider sense, as inclusive of all the Primates except man and lemurs; but it may also be employed in a more restricted application, so as to denote all ordinary "monkeys" as distinct from baboons on the one hand and the tail-less man-like apes on the other. The word appears in English first in the 16th century. The Low-German version of Reynard the Fox (Reinke de Vos, 1479) calls the son of Martin, the ape, Monke; and the French version has Monnequin, Monne-quin; these are apparently Teutonic diminutives of a word for ape which occurs in several Romanic languages, e.g. Fr. monne, Lat. monachus.

MONKHOUSE, WILLIAM COSMO (1840–1901), English poet and critic, was born in London on the 18th of March 1840. His father, Cyril John Monkhouse, was a solicitor; his mother's maiden name was Delafosse. He was educated at St Paul's School, quitting it at seventeen to enter the board of trade as a junior supplementary clerk, from which grade he rose eventually to be the assistant-secretary to the finance department of the office. In 1870–1871 he visited South America in connexion with the hospital accommodation for seamen at Valparaiso and other ports; and he served on various departmental committees, notably that of 1894–1896 on the Mercantile Marine Fund. He was twice married: first, to Laura, daughter of James Keymer of Dartford; and, secondly, to Leonora Eliza, daughter of Commander Blount, R.N. He died in London on the 20th of July 1901. Cosmo Monkhouse was one of those who have not only a vocation, but an avocation. His first bias was to poetry, and in 1865 he issued A Dream of Idleness and Other Poems, a collection strongly coloured by his admiration for Wordsworth and Tennyson. It was marked by exceptional maturity, and scarcely received the recognition it deserved. Owing perhaps to this circumstance, it was not till 1890 that he put forth Corn and Poppies, a collection which contains at least one memorable effort in the well-known "Dead March." Five years later appeared a limited edition of the striking ballad of The Christ upon the Hill, illustrated with etchings by Mr William Strang. After his death his poetical output was completed by Pasieles the Elder and other Poems (including The Christ upon the Hill). In 1868 Monkhouse essayed a novel, A Question of Honour. Then, after preluding with a Life of Turner in the "Great Artists Series" (1879), he devoted himself almost exclusively to art criticism. Besides many contributions to the Academy, the Saturday Review, the Magazine of Art and other periodicals, he published volumes on The Italian Pre-Raphaelites (1887), The Earlier English Water-Colour Painters (1890 and 1897), In the National Gallery (1893) and British Contemporary Artists (1898). He also contributed to the Dict. Nat. Biog. from the beginning. Monkhouse also wrote an excellent Memoir of Leigh Hunt in the "Great Writers Series" (1887). As an art critic Monkhouse's judgments were highly valued; and he had the rare gift of differing without offending, while he invariably secured respect for his honesty and ability. As a poet, his ambition was so wide and his devotion to the art so thorough, that it is difficult not to regret the slender bulk of his legacy to posterity.

MONKS WELL, ROBERT PORRITT COLLIER, 1st BARON (1817–1886), English judge, was born at Plymouth, on the 21st of June 1817, and was the son of a prominent merchant of Quaker extraction. He was educated at Oxford, was called to the bar in 1843, and went the western circuit. He obtained a high reputation by his successful defence of Brazilian pirates in 1845;
they were, indeed, convicted at the assizes, but Collier ultimately procured their escape upon a point of law which the judge had refused to reserve. He was elected member of parliament for Plymouth in the Liberal interest in 1852, and in 1859 was appointed counsel to the admiralty and judge-advocate to the fleet. In this capacity he gave in 1862 an opinion in favour of detaining the Confederate rams building in the Mersey, which would have saved his country much money and much credit if it had been acted upon. In 1863 he became solicitor-general, and in 1868 attorney-general, and in 1869 successfully passed a bankruptcy bill. In 1871 he was appointed Mr Gladstone one of four new judges upon the judicial committee of the privy council, although it was expressly provided by the act creating these offices that none of them should be filled by a law-officer of the Crown. This prohibition was evaded by making Collier a judge of common pleas, and transferring him after a few days to the privy council. This arrangement was unanimously condemned by public opinion, and gave the Gladstone cabinet a serious blow. He officiated, nevertheless, with distinction until his death on the 3rd of November 1886, and was raised to the peerage as Baron Monkswell in 1885. He was a man of many accomplishments, and especially distinguished as an artist; he was a well-known caricaturist and dessiner, and was a member of the Royal Academy and elsewhere. In his younger days he had been noted as a clever caricaturist. He was succeeded in the peerage by his elder son, Robert (b. 1845), who, after taking a first class in law at Cambridge, went to the bar, and became (1871) conveyancing counsel to the treasury, and (1885–1886) an official examiner of the High Court, and, taking to politics as a Liberal, under-secretary for war (1895). The younger son, John Collier (b. 1850), inherited his father's artistic tastes, and became a well-known painter.

MONLUC, or MONLUC, the name of a French family. The house of Lusséran-Mansencome, which possessed the estate of Monluc in Agenais, and took its name in the 16th century, is held to be a branch of the family of Montesquiou. Marshal Blaise de Monluc (d. 1577), author of the Commentaires, had a son, Pierre Bertrand, called the Capitaine Peyrot, who perished in an expedition to Madeira in 1566, and another son, Fabien de Monluc, whose granddaughter, Jeanne de Monluc, d. 1657, cousine de Lescyn, princesse de Chabanais, brought the estates of her house to the family of Esguelleau by her marriage with Charles d'Esguelleau, marquis of Sourdis and Alluye. Jean de Monluc, brother of the marshal, was bishop of Valence and Die, and distinguished himself in several embassies. He died in 1579, leaving a natural son, Jean de Monluc (d. 1603), seigneur de Balagny, who was at first a zealous member of the League, but made his submission to Henry IV., and received from him the principality of Cambray and the bâton of a marshal of France.

MONMOUTH, JAMES SCOTT, DUKE OF (1649–1683), leader of his abortive insurrection against James II. in 1685, was the son of Lucy Walters, ‘a brown, beautiful, bold but insipid creature,’ who became the mistress of Charles II. during his exile at the Hague. He was born at Rotterdam on the 9th of April 1640. That Charles was his father is more than doubtful, for Lucy Walters had previously lived with Robert Sidney (son of the earl of Leicester), brother of Algernon, and the boy resembled him very closely. Charles, however, always recognized him as his son, and published on him an almost doting affection. Until the Restoration he was placed under the care, first of Lord Crofts, by whose name he was known, and then of the queen-dowager, receiving his education to the age of nine from Roman Catholics, but thenceforward from Protestant tutors. In July 1662 he was sent for by Charles, and at thirteen was placed under the protection of Lady Castlemaine and in the full tide of the worst influences of the court. No formal acknowledgment of his relation to the king was made until his betrothal to Anne Scott, countess of Buccleuch, the wealthiest heiress of Scotland, whom he married in 1665. During 1663 he was made duke of Orkney, duke of Monmouth and knight of the Garter, and received honorary degrees at both universities; and on his marriage he and his wife were created duke and duchess of Buccleuch, and he took the surname of Scott. At court he was treated as a prince of the blood. In 1665 he served with credit under the duke of York in the sanguinary naval battle off Lowestoft. A capitancy in the Life Guards was given him, and in 1670, on the death of Monk, he was made captain-general of the king's forces. In 1670 Monmouth was with the court at Dover, and it is affirmed by Reresby that the mysterious death of Charles's sister, Henrietta, duchess of Orleans, was due to her husband's revenge on the discovery of her intrigue with the duke. It is certain, from an entry by Pepys, that as early as 1666 he had established a character for vice and profligacy. He was the direct author of the attack in December 1670 on Sir John Coventry, and only a few months later received the royal pardon for his share in the wanton murder of a street watchman.

Hitherto Monmouth had been but the spoiled child of a wicked court. Now, however, by no act or will of his own, he began to be a person politically important. As early as 1662 the king's excessive fondness for him had caused anxiety. Even then the fear of a "difference" between Monmouth and James, duke of York, exercised men's minds, and every caress or promotion kept the fear alive. Who could tell but that, in default of legitime issue from his queen, Charles might declare Monmouth and Lucy Walters to be the children of the first marriage, and civil war would be the certain consequence. Soon after 1670 the matter was brought to a serious aspect. The anti-popery spirit was rapidly becoming a factitious motive in the succession of James a probability and a terror. Charles was urged to legitimate Monmouth by a declaration of his marriage with Lucy Walters. He returned answer that, much as he loved the duke, he would rather see him hanged at Tyburn than own him for his legitimate son. Every attempt, however, was henceforth made, especially by Shaftesbury, to accustom people to this idea, and his position was emphasized by James's second marriage, with the Roman Catholic princess Mary of Modena. From this time his popular title was "the Protestant duke." In 1674 he was made "commander-in-chief"; and in connexion with this another unsuccessful attempt, graphically described in Clarke's Life of James, was made to gain from Charles a tacit admission of his legitimacy. At Shaftesbury's instance he was placed in command of the army employed in 1675 against the Scottish Covenanters, and was present at Bothwell Bridge (June 24, 1679). In 1678, when Charles was driven into war with Louis XIV., Monmouth was placed at the head of the Monmouth regiment. In 1679, after King Charles had been driven out of England by Shaftesbury, he was given the command of the English contingent at the battle of St. Denis. On his return to London England was in the throes of the popish terror. The idea of securing the Protestant succession by legitimizing Monmouth again took shape and was eagerly pressed on by Shaftesbury; at the time it seemed possible that success would wait on the audacity.

The pensionary parliament was dissolved in January 1678–79, and was succeeded by one still more determined in its anti-popery spirit. To avoid the storm, and to save, if possible, his brother's interests, Charles instructed him to leave the country. James retired to Brussels, the king having previously signed a declaration that he "never was married, nor gave contract to any woman whatsoever but to my wife Queen Catherine." In the summer of 1679 the king suddenly fell ill, and the dangers of a disputed succession became terribly apparent. The party opposed to Monmouth, or rather to Shaftesbury, easily prevailed upon Charles to consent to his brother's temporary return. When, after the king's recovery, James went back to Brussels, he received a present from the queen that Monmouth too should be removed from favour and ordered to leave the court. Accordingly, in September 1679, the latter repaired to Utrecht, while shortly afterwards James's friends so far gained ground as to obtain for him permission to reside at Edinburgh instead of at Brussels. Within two months of his arrival at Utrecht Monmouth secretly returned to England, arriving in London on the 27th of November. Shaftesbury had assiduously kept alive the anti-popery agitation, and Monmouth, as the champion of Protestantism, was received with every sign of popular delight. The king appeared to be greatly incensed, deprived him of all his offices, and ordered him to leave the kingdom at once. This he refused
to do, and the only notice taken of the disobedience was that Charles forbade him to appear at court.

It was at this time that the *Appeal from the Country to the City*, written by Ferguson, was published, in which the legitimacy was tacitly given up, and in which it was urged that “he that hath the worst title will make the best king.” Now it was, too, that the exclusionists, who in the absence of parliament were deprived of their best basis for agitation, developed the system of petitioning. So promptly and successfully was this answered by the “abhorrers” that Charles, feeling the ground safer under him, recalled James to London—a step immediately followed by the resignation of the chief Whigs in the council.

Once more, however, a desperate attempt was made, by the fable of the “black box,” to establish Monmouth’s claims; and once more these claims were met by Charles’s public declarations in the *Gazette* that he had never been married but to the queen. Still acting under Shaftesbury’s advice, Monmouth now went upon the first of his progresses in the west of England, visiting the chief members of the country party, and gaining by his open and engaging manner much popularity among the people. In August 1680 James returned to Edinburgh, his right to the succession being again formally acknowledged by Charles. Monmouth, meantime, was more vehemently than ever into the plans of the exclusionists. He spoke and voted for exclusion in the House of Lords, and used language not likely to be forgotten by James when an opportunity should come for resenting it. He was ostentatiously feasted by the city, the stronghold of Shaftesbury’s influence; and it was observed as he dined to see that the mark of illegitimacy had been removed from the arms on his coach.

The year 1681 seemed likely to witness another civil war. The parliament finished a session of hysterical passion by passing a series of resolutions of extreme violence, of which one was that Monmouth should be restored to all his offices and commands; and when Charles summoned a fresh parliament to meet at Oxford the leaders of the exclusionists went thither with troops of armed men. Not until the dissolution of this last parliament, on the 27th of March 1681, did the weakness of Monmouth’s cause appear. The deep-seated respect for legitimate descent asserted itself, and a great reaction took place. In November Dryden published *Ableton and Abigail*. Shaftesbury was attacked by him, but was saved for the time by a favouring jury. Monmouth himself did not escape insult in the street and from the pulpit. He was forbidden to hold communication with the court; and when he went, in September 1682, on a second progress through the western and north-western counties his proceedings were narrowly watched, and he was at length arrested at Stafford. Severity and extreme lenity were strangely mingled in the treatment he received. He was released on bail, and in February 1683, after the flight and death of Shaftesbury, he openly broke the implied conditions of his bail by paying a third visit to Chichester with Lord Grey and others on pretence of a hunting expedition.

It is probable that Monmouth never went so far as to think of armed rebellion; but there is little doubt that he had talked over schemes likely to lead to this, and that Shaftesbury had gone farther still. The Rye House plot gave an excuse for arresting the Whig leaders; Russell and Sidney were judicially murdered; Monmouth retired to Toddrum and was left untouched. Court intrigue favouring him, he succeeded, by the betrayal of his comrades and by two submissives letters, in reconciling himself with the help of Halifax both to the king and to James, though he had the humiliation of seeing his confessions and declarations of penitence published at length in the *Gazette*. His character for pettiness and folly was thus amply illustrated. Charles heartily despised him, and yet appears to have retained affection for him. His partial return to favour raised the hopes of his partisans; to check these, Algernon Sidney was executed. Monmouth was now subpoenaed to give evidence at the trial of young Hampden. To escape from the difficulties thus opened before him he fled to Holland, probably with Charles’s connivance, and though he once more, in November 1684, visited England, it is doubtful whether he ever again saw the king.

The quiet accession of James II. soon brought Monmouth to the crisis of his fate. Within two months of Charles’s death he had yielded to the impetuosity of Argyll and others of the exiles and to vague invitations from England. It is curious, as showing the light in which his claims were viewed by his fellow-conspirators, that one of the terms of the compact between them was that, though Monmouth should lead the expedition, he should not assume the title of king without their consent, and should, if the rebellion were unsuccessful, resign it and accept whatever rank the nation might offer. Now, as always, he was but a puppet in other men’s hands.

On the 2nd of May Argyll sailed with three ships to raise the west of Scotland; and three weeks later, with a following of only eighty-two persons—of whom Lord Grey, Fletcher of Saltoun, Wade, and Ferguson, the author of the *Appeal from the Country to the City*, were the chief—Monmouth himself set out for the west of England, where, as the stronghold of Protestant dissent and as the scene of his former progresses, he could alone hope for immediate support. Even here, however, there was little prospect of an immediate movement; and when on the 11th of June Monmouth’s three ships, having eluded the royal fleet, arrived off Lyme Regis, he landed amid the curiosity rather than the sympathy of the inhabitants. In the market-place his “declaration,” drawn up by Ferguson, was read aloud. In this document James was painted in the blackest colours. Not only was he declared to be the murderer of Essex, but he was directly charged with having poisoned Charles to obtain his crown. Monmouth soon collected an undisciplined body of some 1500 men, with whom he seized Axminster, and entered Taunton. Meanwhile the parliament had declared it treason to assert Monmouth’s legitimacy, or his title to the crown; a reward of £5000 was offered for him dead or alive, and an act of attainder was passed in unusual haste. Troops had been hurriedly sent to meet him, and when he reached Bridgewater Albermarle was already in his rear. From Bridgewater the army marched through Glastonbury to attack Bristol, into which Lord Feversham had hastily thrown a regiment of foot-guards. The attempt, however, miscarried, and, after summoning Bath in vain, Monmouth, with a disordered force, began his retrograde march through Phillips Norton and Crew Valley. From there he was continually harassed by Feversham’s soldiers. At the latter place he heard of Argyll’s total rout in the western Highlands. He was now anxious to give up the enterprise, but was overruled by Grey, Wade and others. On the 3rd of July he reached Bridgewater again, with an army little better than a rabble, living at free quarters and behaving with reckless violence. On Sunday, the 5th, Feversham entered Sedgemoor in pursuit; Monmouth the same night attempted a surprise, but his troops were hopelessly routed. He himself, with Grey and a few others, fled over the Mendip Hills to the New Forest, hoping to reach the coast and escape by sea. The whole country, however, was on the alert, and at midnight on the 8th, within a month of their landing, James heard that the revolt, desperate from the first, was over and that his rival had been captured close to Ringwood in Hampshire.

On the day of his capture Monmouth wrote to James in terms of the most unmanly contrition, ascribing his wrong-doings to the action of others, and imploring an interview. On the 15th the prisoners reached the Tower, and on the next day Monmouth was allowed to see James. No mercy was shown him, nor did he in the least deserve mercy; he had wantonly attacked the peace of the country, and had cruelly libelled James. The king had not, even in his own mind, any family tie to restrain him from exercising just severity, for he had never believed Monmouth to be the son of any one but Robert Sidney. Two painful interviews followed with the wife for whom he bore no love, and who for him could feel no respect; another imploring letter was sent to the king, and abject protestations and beseechings were made to all whom he saw. He offered, as the last hope, to become a Roman Catholic, and this might possibly have proved successful, but the priests sent by James to ascertain
the sincerity of his "conversion," declared that he cared only for his life and not for his soul.

He met his death on the scaffold with calmness and dignity. In the paper which he left signed, and to which he referred in answer to the questions wherewith the busy bishops plied him, he expressed his sorrow for having assumed the royal style, and at the last moment confessed that Charles had denied him to him privately, as he had publicly, that he was ever married to Lucy Walters. He died at the age of thirty-six, on the 15th of July 1685.

Monmouth had four sons and two daughters by his wife, who in 1688 married the 3rd Lord Cornwallis and died in 1732. The elder of the two surviving sons, James, earl of Dalkeith (1674-1705) had a son Francis (1693-1731), who through his grandmother inherited the title of duke of Buccleuch in 1732, and was the ancestor of the later dukes. The younger son, Henry (1679-1730), was created earl of Deboraine in 1706, and rose to be a major-general in the army.

The best accounts of Monmouth's career, apart from the modern histories, are G. Roberts' detailed Life (184), in the articles in the Dict. Nat. Bio. (1843) A. W. Ward, and in Clarendon Peerage, and the Correspondence of Lord Clarendon with James, earl of Abingdon, 1683-1685 (Clarendon Press, 1896). For the rebellion, Lord Grey's Secret History (1734) should be consulted. See also Evelyn's and Pepys' Diaries, &c.

**MONMOUTH, ROBERT CAREY, 1ST EARL OF (c. 1560-1650),** youngest son of Henry Carey, 1st Baron Hunsdon, chamberlain and first cousin of Queen Elizabeth, by Anne, daughter of Sir Thomas Morgan, of Arkestone in Herefordshire, was born about the year 1560. As a young man he accompanied several diplomatic missions abroad and took part in military expeditions. In 1587 he joined in the attempt to relieve Sluys, in 1588 served as a volunteer against the Spanish expedition, and commanded a regiment in Essex's expedition to Normandy in 1591, taking part in the siege of Rouen. He was knighted by Essex the same year for having by his intercession with the queen procured his recall. In the parliaments of 1586 and 1588 he represented Morpeth; in that of 1593, Callington; and in those of 1596 and 1601, Northumberland. From 1593 till the end of Elizabeth's reign he occupied various posts in the government of the Scottish borders, succeeding to his father's appointment of lord warden of the marches in 1596, which he held till February 1598. In March 1603 he visited the court, and witnessed the queen's last illness, which he described in his Memoirs. Anxious to recommend himself to her successor, and disobeying the orders of the council, he started on horseback immediately after the queen's death to London, and was the first to communicate the tidings to James, arrived at Holyrood late on the 26th, and was appointed by the king a gentleman of the bedchamber. But his conduct met with general and merited censure as "contrary to all decency, good manners and respect," and on James's arrival in England he was dismissed from his new post. On the 23rd of February 1605, however, he was made governor of Prince Charles, in 1611 his master of the robes, in 1617 his chamberlain, and on the 6th of February 1622, he was created Baron Carey of Leppington. In 1623 he followed Charles to Spain, and after the latter's succession to the throne he was created earl of Monmouth in 1626. He died on the 12th of April 1639. His eldest son Henry (1596-1661), succeeded him as 2nd earl of Monmouth, and on his death without surviving male issue the peerage became extinct.

His Memoirs were published first by the earl of Cork and Orrery in 1759, a new edition, annotated by Sir Walter Scott, being printed in 1868.

**MONMOUTH (Welsh Mynyw), a municipal and contributory parliamentary borough, and the county-town of Monmouthshire, England, 18 m. S. of Monmouth; on the Monnow and the Usk, the main railway junction. Pop. (1901), 5,052.** It is picturesquely situated at the confluence of the Wye and the Monnow, between the two rivers, and is almost surrounded by hills. Portions of the town walls remain, and there is a picturesque old gateway on the Monnow bridge; but there are only insignificant ruins of the castle, which was originally a Saxon fortress, and was twice taken by the Parlia-

monetary forces during the Civil War. Besides the churches—that of St Mary, completed in 1882 on an ancient site, and the chapel of St Thomas, a late Norman structure—the principal buildings are the town-hall, the Rolls Hall and the free grammar-school, which was founded in 1614 and educates about 150 boys on the usual lines of a public school. A statue of Henry V., who was born in its castle, stands in the market-place. With Newport and Usk, Monmouth forms the Monmouth parliamentary district of boroughs, returning one member.

Monmouth (Monsunut) from the coincidence of position is supposed to be the Blaestium of Anonimus. Situated between the Severn and the Wye its strategic importance was early recognized by the Saxons, who fortified it against the Britons, while in later years it played a leading part in Welsh border warfare. At the time of the Domesday Survey the castle was in the custody of William Fitz Baderon. Henry III. granted it, together with the lordship of the borough, to his son Edmund Crouchback, through whose descendants both borough and castle passed into the duchy of Lancaster. Since the 18th century the dukes of Beaufort have been lords of the borough. Monmouth was a borough by prescription as early as 1256, and was governed by a mayor in 1461, but was not incorporated until 1590 under the title of "Mayor, Bailiffs and Commonalty." This charter was confirmed in 1558, 1606 and 1666, a recorder and clerk being added to the constitution. In accordance with the act of 1535-1536, although as county town it obtained the right of representation in parliament, the earliest returns existing are for 1553, since which date one member has been returned regularly. Wednesday and Saturday markets were confirmed to Monmouth in 1550, with the further proviso that no others were to be held within five miles of the borough. Friday is now the weekly market-day. At the same time an annual three-days' fair, which still exists, was granted on Whit-Tuesday and successive days. During the 16th and 17th centuries the manufacture of Monmouth caps was an important industry, fostered by legislation and mentioned by Fuller in his *Worthies of England.*

**MONMOUTH, a town and county-seat of Warren county, Illinois, in the W. part of the state, about 40 m. S. of Rock Island. Pop. (1890), 5936; (1900), 7460; (1910), 9728.** It is served by the Chicago, Burlington & Quincy and the Iowa Central railways, and by electric railways to Galesburg and to Rock Island. The city is the seat of Monmouth College (1857 United Presbyterian), which in 1908 had 28 instructors and 200 students. Among the principal buildings and institutions are the county court-house, the federal building, a hospital and the Warren county library (1836). Monmouth is situated in a good farming region, and cattle, swine and ponies are raised in the vicinity. The city has various manufactures. Monmouth was settled about 1824, first incorporated as a village in 1836, chartered as a city in 1852 and in 1882 reorganized under a general state law.

**MONMOUTH, BATTLE OF (1778), a battle in the American War of Independence. The prospect of an alliance between France and America in 1778 induced the British to concentrate their forces. Sir Henry Clinton, who had succeeded Sir W. Howe in command, determined to abandon Philadelphia, captured in the previous year, and move his troops direct to New York through New Jersey. Washington, who had spent the winter at Valley Forge, Pennsylvania, and had materially recruited his army, immediately marched to intercept the British, and overtook them near Monmouth Court House (now Freehold), New Jersey, on the 26th of June 1778. A strong detachment of Americans under General Charles Lee was sent forward to harass the enemy's rear and if possible cut off a portion of their long baggage train. Clinton strengthened his rearguard, which turned upon the Americans and compelled them to retreat. When Washington, who was well up with his main body, heard of Lee's retreat, he spurred forward and exhorted himself in forming a strong line of battle in case the British continued their determined attack. Warm words passed between Washington**
and Lee, which subsequently led to the latter's court-martial and suspension for a year. The readjusted American line was composed of the divisions of Lafayette, Greene, Alexander and Patterson, while Wayne's brigade, which had been in Lee's advance from the first, was posted in a favourable position.

The British attacked this line and a warm, though brief, engagement ensued. Both sides encamped at night on the ground occupied. The British, having accomplished their object in delaying Washington's pursuit, continued their march the next day towards New York. Washington turned to the left, crossed the Hudson above, and encamped for the remainder of the season at White Plains, New York, within striking distance of the city. Each side suffered about the same loss in the battle, that of the British being 400 (60 due to sunstroke), the American somewhat less. In this engagement Lieut.-Colonel Henry Monkton (1740-1778) of the British Grenadiers was killed in leading a charge.

**MONMOUTHSHIRE**, a western border county of England, bounded E. by Gloucestershire, N.E. by Herefordshire, N.W. by Brecknock, and W. and S. by Glamorganshire, and S. by the estuary of the river Severn. The area is 534 sq. m. The surface varies slightly in picturesqueness, but the narrow valley of the Wye, bounded by the tunnel-like height of the Black Mountains and the plateau of Glyndebourne, is a feature that attracts the traveller. The river, which rises in the mountains of the north and flows southward past Chepstow, contains, near Newport, a beautiful fall of water. Its estuary, Abergavenny, and the mouth of Monnow, are the chief towns of the county.

**Geology**.—The oldest rocks in the county are the Silurian strata (Wenlock Shale and Limestone, and Ludlow Beds) which form an extensive anticline at Usk; a smaller inlier appears at Rumney on the southern shore of the river Severn, across the county near Newport. The dip is from west to east, and the Old Red Sandstone, a great series of red marls, sandstones and concretionary limestones (cornstones) which occupy the north-eastern part of the county; thehighest beds contain grits and conglomerates which give rise to bold escarpments and lofty ridges. The Coal Measures (Coal Series, Pennant Sandstone and Upper Coal Series) dip westward and succeed each other from east to west. The Coal Measures abound in coal-seams and ironstone, and their densely populated valleys are among the most productive in England. The conical hill consisting of the Carboniferous Limestone, which forms the eastern edge of the county, is very extensive and contains the old Roman road between Usk and Monmouth. The town of Abergavenny, which was formerly the chief town of the county, was situated on this road, and is now a town of little importance.

In the north-west of the county, near Monmouth, is the site of the ancient town of Isca Silurum, which was one of the chief towns of the Silures. It was destroyed by the Romans in A.D. 1049, and its remains are now seen in a field near Monmouth.

The county is divided into six districts: Abergavenny, Chepstow, Monmouth, Newport, Usk, and Monmouth. The town of Monmouth is the county town.

The population of the county is 68,244, being 34 per cent of the total for England and Wales.

The principal rivers in the county are the Wye, the Monnow, and the Usk. The Wye rises in the mountains of the north and flows southward past Chepstow, containing, near Newport, a beautiful fall of water. Its estuary, Abergavenny, and the mouth of Monnow, are the chief towns of the county.

**Agriculture**.—The scenery of the county is beautiful and pastoral, with rich soils and fertile pastures. The chief agricultural districts are the Vale of Chepstow, the Vale of Monmouth, and the Vale of Usk. The chief crops are wheat, barley, and oats. The county is also noted for its dairy produce, particularly milk and cheese.

The county is divided into six districts: Abergavenny, Chepstow, Monmouth, Newport, Usk, and Monmouth. The town of Monmouth is the county town.

the building and carried out the provisions prepared for the king's reception.

After the Conquest the district conquered by Harold was bestowed on William Fitz Osborne, earl of Hereford, who built Monmouth Castle, and continued the line of defence against the Welsh frontier along the Wye, while a second line of fortifications along the Usk Valley marked the continued advance of the Normans, who by 1085 had subjugated almost the whole of Gwent. The lordship of Overwent fell to Hamelin de Baldun, who founded the castle and priory of Abergevanny, and from him passed to Brian Fitz Count and later to Walter Fitz Miles, earl of Hereford. The lordship of Netherwent remained for many centuries with the Clare family. Penhow Castle was a stronghold of the family of St Maur or Seymour, from whom are descended the present dukes of Somerset, and Groomst and Skenebrth Castles of the family of Braose. Gwent still ranked as Welsh territory at the time of the Domesday Survey, but the town of Monmouth, the castle of Caerleon, and the district of Archenfield, are assessed under Herefordshire, and the three hundred of Llanwern, Portskewet and Dinam under Gloucestershire. The Norman lords of the present county held their lands "par baroniam," so that the king's writ did not run in them, and the lives and property of the poorer inhabitants were entirely at the mercy of these lords marchers as they were termed. The county still exhibits remains of the exchequer and of the twelfth and thirteenth centuries, and the county of Gwent was formerly divided into four parts, each comprising several commotes. Cantref Uwchcoed, or Upper Gwent, comprised the commotes of Ergog and Ewys, now principally in Herefordshire, and the greater part of the present hundreds of Skenebrth, Abergevanny and Usk; Cantref Isdoc, or Lower or Nether Gwent, comprised the present hundreds of Raglan and parts of Caldecote and Usk; Cantref Gwentlwg comprised the present hundred of Wentlwg; while the fourth cantref, Cantref Coch, now forms the Forest of Dean in Gloucestershire. Leland, writing in the 16th century, describes Gwent as comprising the three divisions of low, middle and high "Venteland," and at this period it included no less than 24 lordship marches, each governed by its own ancient laws and customs and ruled by its own lord. Under the act of 1536 for the abolition of the marches, these 24 lordships were united to form a shire; Monmouth was constituted the shire town, and the sheriff's court was ordered to be held alternately at Monmouth and Newport. A commission was also appointed to divide the shire into hundreds, which were made 6 in number: Abergevanny, Caldecote, Raglan, Skenfrith, Usk, Wentlwg, the bounds being subsequently ratified by act of Parliament in 1542–1543. No sheriffs were actually appointed for Monmouthshire until 1541, and the legal authority of the lords marchers was not finally abolished until 1689. The act of 1536 did not expressly separate the county from Wales, and it was only gradually that Monmouthshire came to be regarded as an English county, being included in the Oxford circuit for the first time in the reign of Charles II.

Ecclesiastically Monmouthshire has been almost entirely included in the diocese of Llandaff since the foundation of that diocese in the 6th century. Monmouth, however, was in the diocese of Hereford, and a few parishes formed part of the diocese of St David's until under the statute of 1836 the whole county passed under the jurisdiction of the bishop of Llandaff. It contains, wholly or in part, 134 ecclesiastical parishes.

The river fisheries of Monmouthshire have been famed from very early times. It has been said that several ships were lost in the Wye, yielding a return of £7, 10s. at the time of the Domesday Survey. Coal is said to have been worked in the reign of Edward I., but the industry lapsed altogether until it received new life from the construction of the canal between Blaenavon and Newport in 1792, and was largely developed in 1795. The first two workers at Pontypool were a family of the name of Grant, who were succeeded in 1856 by Mr Richard Hanbury. In 1740, however, Monmouthshire contained only two furnaces, making 900 tons annually. Fifty years later three new furnaces were constructed at Blaenavon, and from that date the industry steadily improved.

By the act of 1536 two knights were to be returned for the shire and one burgess for the borough of Monmouth, but the first returns for the county were made in 1547 and for the borough in 1553.

From 1698 the boroughs of Newport and Usk returned one member each. Under the Redistribution of Seats Act of 1885 the county now returns three members in three divisions.

Antiquities.—Of Norman fortresses in Monmouthshire, either built by the taking possession of the lords of the marches, there are remains of no less than twenty-five. The more interesting and important are: Caldicot, the seat of the De Bohuns, with a round keep of the 13th century, gatehouse and other portions, still partly inhabited; Chepstow, one of the finest examples of the Norman towers, a short distance above the Usk; Newport, Abergevanny, the gateway and hall of Gromst, once the residence of the dukes of Lancaster; and Usk Castle, rebuilt by the Clares in the time of Edward IV. Raglan Castle, begun in the 12th century, was finished in the 15th and is still preserved in a remarkable state of preservation, and of special interest as a very late example of the feudal stronghold. Charles I. resided in it after the battle of Naseby, and in 1646 it was delivered up to the parliamentary forces after a stubborn resistance of ten weeks against Colonel Morgan and General Fairfax.

At the Reformation there were in Monmouth two hospitals and fifteen other religious houses; but of these there are now important remains of only two—Llanthony Abbey and Tintern Abbey, both Cistercian. Llanthony Abbey in the Black Mountains was founded by William de Lacy in 1103, and the church, dating from about 1200, is one of the earliest examples in England of the Pointed style. The ruins consist of portions of the nave, transept, central tower and choir. Tintern Abbey (C.), founded by Walter de Clare in 1131, occupies a position of great beauty on the Wye, and is among the finest monastic ruins in England. Of the churches, those chiefly worthy of mention are at Abergevanny, belonging to a branch of the family of the Earls of Devon; Chepstow, partly Norman, and possessing a richly moulded doorway; St Woolos' Church, Newport, also Norman; the Norman chapel of St Thomas, Monmouth; Christchurch, principally Norman; Machen, Early English, with a tall tower of C.-W. in the 13th century; and Usk, formerly attached to a Benedictine priory.

MONNIER, MARC (1827–1885), French writer, was born at Florence on the 7th of December 1827. His father was French, and his mother a Genevese; he received his early education in Naples, he then studied in Paris and Geneva, and he completed his education at Heidelberg and Berlin. He became professor of comparative literature at Geneva, and eventually vice-rector of the university. He died at Geneva on the 18th of April 1885. He wrote a series of short, satirical, dramatic sketches collected as Théâtre de marionnettes (1871), and stories, notably Nouvelles napolitaines (1879), numerous works on Italian history, a translation of Goethe's Faust, Genève et ses poètes (1873), &c. The first volume of his Histoire de la littérature moderne, La Renaissance, de Dante à Luther (1884), was crowned by the French Academy.

MONNIKENDAM, a fishing village of Holland, in the province of North Holland, on an inlet of the Zuider Zee known as the Gouw Zee, 12 m. N.N.E. of Amsterdam, with which it is connected by steam trawm. It was once a flourishing town, but its quietness now is only disturbed by the advent of the numerous tourists who visit it in the summer, crossing hence to the island of Marken. Among the notable buildings are the weigh-house (17th century), the bell-tower (1591), formerly attached to the town-hall before this was destroyed in the 18th century, and the church of St. Nicholas, with its beautiful massive tower. Mention is made of this church in a document of 1356, but it was not completed until the beginning of the 18th century. It contains some fine carvings, many interesting old tombs, and a monument of Jan Nieuwenhuizen, the founder of the Society for Public Welfare (Tot Nut van het Algemeen) in 1785.

MONOCHORD (Gr. μόνοκορδόν, καρύον μονοκύρα); med. Lat. monochordum), an instrument having a single string, used
MONOD, A.—MONOGENISTS

by the ancient Greeks for tuning purposes and for measuring the scale arithmetically. The monochord, as it travelled westwards during the middle ages consisted of a long board, or narrow rectangular box, over which was stretched the single string; along the edge of the sound-board was drawn a line divided according to simple mathematical ratios to show all the intervals of the scale. A movable bridge was so contrived as to slide along over the string and stop it at will at any of the points marked. The vibrating length of string, being thus determined as on the guitar, lute, violin, &c., yielded a note of absolutely correct pitch on being twanged by fingers or plectrum. In order the better to seize the relation of various intervals, a second string tuned to the same note, but out of reach of the bridge, was sometimes added to give the fundamental.

(K. S.)

MONOD, ADOLPHE (1802–1856). French Protestant divine, was born on the 21st of January 1802, in Copenhagen, where his father was pastor of the French church. He was educated at Paris and Geneva, and began his life-work in 1825 as founder and pastor of a Protestant church in Naples, whence he removed in 1827 to Lyons. Here his evangelical preaching, and especially a sermon on the duties of communicants ("Qui doit communier"?), led to his deposition by the Catholic Minister of education and religion. Instead of leaving Lyons he began to preach in a hall and then in a chapel. In 1836 he took a professorship in the theological college of Montauban, remaining in 1847 to Paris as preacher at the Oratoire. He died on the 6th of April, 1856. Monod was undoubtedly the foremost Protestant preacher of the 19th century France. He published three volumes of sermons in 1830, another, La Crédulité de l'incredulé en 1844, and two more in 1855. Two further volumes appeared after his death. His elder brother Frédéric (1794–1863), who was influenced by Robert Haldane, was also a distinguished French pastor, who with Count Gasparin founded the Union of the Evangelical Churches of France; and Frédéric's son Théodore (b. 1836) followed in his footsteps.

MONOD-GABRIEL (1834–1880). French historian, was born at Havre on the 7th of March, 1834. Adolphe Monod (q.v.) was his uncle. Having studied at Havre, he went to Paris to complete his education, and whilst there lived with the family of De Pressensé. The influence of Edmond de Pressensé, a pastor and large-minded theologian, and of Madame de Pressensé, a woman of superior intellect and refined feeling, who devoted her life to educational works and charity, made a great impression on him. In 1863 he left the École normale supérieure, and went to Germany, where he studied at Göttingen and Berlin. The teaching of George Wilts definitely directed his studies towards the history of the middle ages. Returning to France in 1868 he was nominated by V. Duruy to give lectures on history, following the method used in German seminars, at the École des hautes études. When the Franco-Prussian War broke out, Gabriel Monod, with his cousins, Alfred and Sarah Monod, organized an ambulance with which he followed the whole course of the war. He published the memoirs of this campaign, Allemands et Français (1871), in which he spoke of the conquerors without bitterness; this attitude was all the more praiseworthy as his mother was an Alsatian, and he was unable to resign himself to the loss of Alsace and Lorraine. The war being over he returned to teaching. At this period of his life he wrote Grégoire de Tours et Marius d'Avenches (1872); Frédégaire, whose history, taken from original MSS, he published in 1888, is a translation of a book of W. Junghans, Histoire critique des règnes de Childéric et de Chlodovech, with introduction and notes (1879); Études critiques sur les sources de l'histoire carolingienne (1868, 1st part only published); and Bibliographie de l'histoire de France (1888). He himself said that his pupils were his best books; he intended to teach them not so much new facts as the way to study, endeavouring to develop in them an idea of criticism and truth. They showed their gratitude by dedicating a book to him in 1896, Études d'histoire du moyen âge, and after his retirement in 1895 by having his features engraved on a slab (see A Gabriel

MONOD, en souvenir de son enseignement: école pratique des haute Études, 1868-1905, École normale supérieure, 1880-1904. May 26, 1907). In 1875 he founded the Revue Historique, which rapidly became a great authority on scientific education. Some of his articles in this and other periodicals have been put together in book form, Les Maîtres de l'histoire: Renan, Taine, Michelet (1884); Portraits et souvenirs (1890; on Hugo, Fustel de Coulanges, V. Duruy, &c.).

MONOGENELPHIA (i.e. "single uterus,"—in allusion to the fusion of at least the basal portions of this organ, and in contradistinction to their duality in the Didelphidae, or Marsupialia), Cuvier's name for the group which includes all the orders of mammals (See MAMMALIA) except the Marsupialia and Monotremata; other titles for this group being Placentalia and Eutheria. With the Monotremata (q.v.) this group has no near affinity; and while more nearly related to the Marsupialia (q.v.), in which an imperfect allantoic placenta is sometimes developed, it is broadly distinguished therefrom by the variable presence of a functional placenta by the aid of which the foetus is nourished throughout the greater portion of intra-uterine life. Other distinctive features by which mammals are separated from monodelphians or placentals will be found in the article last mentioned.

(R. L.)

MONOGENISTS, the term applied to those anthropologists who claim that all mankind is descended from one original stock (µούς single, and γένος, race), and generally from a single pair; while polygenists (πολύς, many) contend that man has had many original ancestors. Of the older school of scientific monogenists J. F. Blumenbach and J. C. Prichard are eminent representatives, as is A. de Quatrefages of the more modern. The great problem of the monogenist theory is to explain by what course of variation races of man so different have sprung from a single stock. In ancient times little difficulty was felt in this, authorities such as Aristotle and Vitruvius seeing in climate and circumstance the natural cause of racial differences, the Ethiopian having been blackened by the tropical sun, &c. Later and closer observations, however, have shown such influences to be, at any rate, far slighter in amount and slower in operation than was supposed. M. de Quatrefages brings forward (Unité de l'espèce humaine, Paris, 1868. ch. ix) his strongest arguments for the variability of races under change of climate, &c. (action du milieu), instancing the asserted alteration in complexion, constitution, and character of negroes in America, and Englishmen in America and Australia. But although the reality of some such modification is not disputed, especially as to stature and constitution, its amount is not enough to counterbalance the remarkable permanence of type displayed by races ages after they have been transported to climates extremely different from that of their former homes. Moreover, physically different races, such as the Bushmen and the pure negroid types in Africa, show no signs of approximation under the influence of the same climate; on the other hand, the coast tribes of Tierra del Fuego and forest tribes of tropical Brazil are more remarkable for the subordination of the differences of climate and food. Darwin, than whom no naturalist could be more competent to appraise the variation of a species, is moderate in his estimation of the changes produced on races of man by climate and mode of life within the range of history (Descent of Man, pt. i. chs. 4 and 7). The slightness and slowness of variation in human races having been acknowledged, a great difficulty of the monogenist theory was seen to lie in the shortness of the chronology with which it was formerly associated. Inasmuch as several well-marked races of mankind, such as the Egyptian, Phoenician and Ethiopian, were much the same three or four thousand years ago as now, their variation from a single stock in the course of any like period could hardly be accounted for except by a miracle. This difficulty was escaped by the polygenists theory (see Georges Pouchet, Plurality of the Human Race, 1838, 2nd ed., 1864, Introd.). Two modern views have, however, intervened which have tended to restore, though under a new aspect, the doctrine of a single human stock. One has been the recognition of the fact that man has
 existing during a vast period of time, which has made it easier to assume the continuance of very slow natural variation of races. The other view is that of the evolution or development of species. It does not follow necessarily from a theory of evolution of species that mankind must have descended from a single stock, for the hypothesis of development admits of the argument that several simian species may have culminated in several races of man (Vogt, Lectures on Man, London, 1864, p. 463). The general tendency of the development theory, however, is against constituting separate species where the differences are moderate enough to be accounted for due to variation from a single type. Darwin's summing up of the evidence as to unity of type throughout the races of mankind is as distinctly a monogenist argument as those of Blumenbach, Prichard or Quatrefages:

"Although the existing races of man differ in many respects, as in colour, hair, shape of skull, proportions of the body, &c., yet their whole organization be taken into consideration they do not resemble each other closely in a multitude of points. Many of these are so unimportant, or of so singular a nature, that it is extremely improbable that they should have been independently acquired by any other than the same species, or races. The same remark holds good with equal or greater force with respect to the numerous points of mental similarity between the most distinct races of man.

... Now when naturalists observe a close agreement in numerous small details or tastes and dispositions, between two or more domestic races, or between nearly allied natural forms, they use this fact as an argument that all are descended from a common progenitor who was thus endowed, and, consequently, that all should be regarded as under the same species. The same argument may be applied with much force to the races of man." (Descent of Man, pt. i. ch. 7.)

A suggestion by A. R. Wallace has great importance in the application of the development theory to the origin of the various races of man; it is aimed to meet the main difficulty of the monogenist school, how races which have remained comparatively fixed in type during the long period of history, such as the white man and the negro, should have, in even a far longer period, passed by variation from a common original. Wallace's view is substantially that the remotely ancient representatives of the human race, being as yet animals too low in mind to have developed those arts of maintenance and social ordinances by which man holds his own against influences from climate, and circumstances were, in their wild state much more plastic than now to external nature; so that "natural selection" and other causes met with but feeble resistance in forming the permanent varieties or races of man, whose complexion and structure still remain fixed in their descendants (Contributions to the Theory of Natural Selection, p. 319).

MONOGRAPH (from Late Lat. monogramma, in late Gr. μονόγραμμον, from μόρος, single, γράμμα, letter), originally a cipher consisting of a single letter, now a design or mark consisting of two or more letters intertwined together. The letters thus interlaced may be either all the letters of a name, or the initial letters of the Christian and surnames of a person for use upon note-paper, seals, &c. Many of the early Greek and Roman coins bear the monograms of rulers for whom or the towns in which they were struck. The Late Latin and Greek words were first applied to the signatures, which took this form, of the emperors of the Eastern Empire. The titles of the Frankish kings also took the form of a monogram. The accompanying monogram, from a coin of Charles the Bald, is a good example of a "perfect" monogram, in which all the letters of the name Karolus can be traced (see Diplomatic and Autography). The most famous of monograms is that known as the "Sacred Monogram," formed by the conjunction of the two initial letters of Χριστός, Christ. The most usual form of this is the symbol ☧, and sometimes the α (alpha) and ω (omega) of the Apocalypse were placed on either side of it. The symbol was incorporated in the Labarum (☧) when the imperial standard was Christianized. The interfaced I.H.S. (also called "The Sacred Monogram") apparently no great antiquity; it is said to have been the creation of St Bernard of Siena in the middle of the 13th century. Monograms or ciphers were often used by the early printers as devices, and are of importance in fixing the identity of early printed books. Similar devices have been used by painters and engravers. The middle ages were, indeed, extremely prolific in the invention of ciphers alike for ecclesiastical, artistic and commercial use. Every great personage, every possessor of fine taste, every artist, had his monogram. The monas's mark also was, in effect, a cipher. As the merchant had as a rule neither right nor authority to employ heraldic emblems, he therefore fell back upon plain simple letters arranged very much in monogram form. These "merchants' marks" generally took the form of a monogram of the owner's initials together with a private device. They nearly always contain a cross, either as a protection against storms or other catastrophes, or as a Christian mark to distinguish their goods from Mahommedan traders in the East. There is a fine example of a 16th century gold ring with a merchant's mark in the British Museum. One of the most famous of secular monograms is the interlaced "H.D." of Henri I., which was erected in the buildings of the king. It was sown profusely; it was stumped upon the buildings in the royal library, together with the bow, the quiver and the interlocked crescents of Diana. It has been argued that "H.D." is a misreading of "H.C.," which would naturally point to husband and wife; but the question is set at rest by the fact that Henri II. sometimes signed his letters to Diane with this very monogram. Henri IV. invented a punning cipher for his mistress Gabrielle d'Estrees, the surname being represented by a capital S. with a tral, or stroke through it.

See F. Builiot, Dictionnaire des monogrammes (1832-1834, 3 parts); G. K. Nagler, Die Monogrammsitten (1857-1856, 5 parts; Kis-Faquot, Dictionnaire des monogrammes et monogrammes, etc. (1893); also Du Cange, Glossarium (v. Monogramma), with plates giving examples of the monograms of early popes, the emperors of the Western Empire, and of other kings.

MONOLOGUE (from Gr. μόρος, alone, and λόγος, speech), a passage in a dramatic piece in which a personage holds the scene to himself and speaks unconsciously aloud. The theory of the monologue is that the audience overhears the thoughts of one who believes himself to be alone, and whom thus informs them of what would otherwise be unknown. This word is also used in cases when a character on the stage speaks at great length, even though not alone, but is listened to in silence by the other characters. The old-fashioned tragedies of the 17th and 18th centuries greatly affected this convention of the monologue, which has always, however, been liable to ridicule. There is something of a lyrical character about the monologue in verse; and this has been felt by some of the classic poets of France so strongly, that many of the examples in the tragedies of Corneille are nothing more or less than odes or cantatas. The monologues of Shakespeare, and those of Hamlet in particular, have a far more dramatic character, and are, indeed, essential to the development of the play. Equally important are those of Racine in Phèdre and in Athalie. The French critics record, as the most ambitious examples of the monologue in two centuries, that of Figaro in Beaumarchais's Le Mariage de Figaro and that of Charles V. in Victor Hugo's Hernani, the latter extends to two lines. In the Elizabethan drama, the popularity of Kyd's Spanish Tragedy, in which Hieronimo spouts his self-tormentor's words, endures to this day. In this sense, the Elizabethan drama, the popularity of Kyd's Spanish Tragedy, in which Hieronimo spouts his self-tormentor's words, endures to this day. In this sense, the most astonishing example of monologizing in the English drama is that of Goodwife simple in Ben Jonson's Every Man Out of His Humor, where a monologue by a character on the stage is given at great length.

MONOMOTAPA. In old maps of south-east Africa, derived originally from Portuguese and from Dutch sources, an extensive region on the Cuama or Zambesi and to the south of it is styled regnum monomotapa. The precise character of the kingdom or empire to which allusion is made has been the subject of much discussion, and some modern historians have gone so far
as to relegate the monomotapa to the realm of myth. But such scepticism is unjustifiable in view of the perfect unanimity with which, in spite of variations of detail, all Portuguese writers from the beginning of the 16th century onwards reiterated the assertion that there was a powerful rule known far and wide by that title.

The word "monomotapa" is of Bantu origin and has been variously interpreted. Father J. Torrend, Comparative Grammar of the South African Bantu Languages (p. 101) renders it "Lord of the water-elephants," and remarks that the hippocotamus is even to the present day a sacred animal among the Karanga. The earliest recorded bearer of the name is Mokomba Menamotapa, mentioned by Diogo de Alcaçova in 1506 as father of the Kwasarimgo Menamotapam who ruled at that date over Vealanga, a large kingdom that included Sofala. His capital was called Zumubany, an obvious corruption of the term "Zumunabhe" regularly used to describe the residence of any important chief. The title is still found during the 18th century, but had probably become extinct by the beginning of the 19th if not earlier. Possibly its use was not confined to a single tribal section, occurring as it does in conjunction with the distinct dynastic names of Mokomba and Mambo, but the Karanga is the only tribe to which the Portuguese chroniclers attribute it. The latter, indeed, not only refer repeatedly to the tenacious persistence of the people of the monomotapa "(i.e. of the Karanga tribe)" but explicitly assert that the "emperor himself was a Mocaranga." Consequently, he must have been a negro, and the Dominican who records the baptism of Dom Filipe by a friar of the order in the middle of the 17th century actually states that this "powerful king" was a black man ("com as carnes pretas"). This alone would be sufficient to controvert the baseless assumption that there existed in southern Rhodesia a ruling caste of different racial origin from the general Bantu population. The events following on the murder of the Jesuit father Dom Gonçalo da Silveira (cf. Lusiads X. 93) sufficiently demonstrate that the monomotapa, though susceptible to the persuasion of foreigners, was an independent potentate in the 16th century. The state and ceremony of his court, the number of his wives, and the order and organization of his officials, are described by several of the chroniclers.

It is difficult to arrive at an estimate of the extent of territory over which this great negro chief exercised direct or indirect control. The most extravagant theory is naturally that which was expressed by the Portuguese chroniclers contemporary with the dispute as to the ownership of Delagoa Bay. The crown of Portugal had in its case against England on the cession of territory contained in a well-known treaty with the monomotapa (1629), and stated that this monarch's dominions then extended nearly to the Cape of Good Hope. A more moderate and usual view is given by Diogo de Couto, who in 166 speaks of "a dominion over all Kaffirria from the Cabo das Correntes to the great river Zambezi." Several 17th-century writers extend the "empire" to the north of the Zambezí, Bocarro giving it in all "a circumference of more than three hundred leagues." It was "divided among petty kings and other lords with fewer vassals who are called inquisis or fumos." According to these authors, however, including Dos Santos, the paramountcy of the monomotapa was impaired in the 17th century by a series of rebellions. His zimbabwè, wherever it may have been in earlier days, was now fixed near the Portuguese fort of Masapa, only a short distance south of the Zambezi. A Portuguese garrison was maintained in it, and the monarch himself from the year 1607 onwards was little more than a puppet who was generally baptized by the Dominicans with a Portuguese name.

The only authorities of value are the original Portuguese documents collected, translated and edited by G. McC. Theal under the title Records of South Eastern Africa (9 vols., London, 1896–1903). Reference may be made to A. Wilmut's Monomotapa (London, 1896), which is, however, to a large extent superseded by Theal's far richer collection of material.

MONONGAHELA—MONOPHYSITES

Pittsburg. Pop. (1890), 4006; (1900), 5173 (711 foreign-born and 345 negroes); (1910), 7508. It is served by the Pennsylvania and the Pittsburg & Lake Erie railways, and by electric railways to Pittsburg and Washington, Pa. Monongahela is in a coal region, and the mining of coal is its principal industry. It was laid out as a town in 1792 by Joseph Parkinson, and named by him Williamsport; but it was commonly known as Parkinson's Ferry until 1833, when it was incorporated as a borough. Four years later the present name was adopted, and in 1873 Monongahela was chartered as a city. It was here that the Whisky Insurrection convention met on the 14th of August 1874.

MONOPHYSITES (Gr. μονοφησία), the name given to those who hold the doctrine that Christ had but one (μονός) composite nature (φύσις), and especially to those who maintained this position in the great controversies of the 5th and 6th centuries. The synod of Chalcedon (c.v.) in 451, following the lines of Pope Leo I's famous letter, endeavoured to steer a middle course between the so-called Nestorian and Eutychian positions. But the followers of Cyril of Alexandria, and with them those of Eutyches, saw in the Chalcedon decree of two natures only another form of the "Nestorian" duality of persons in Christ, and rose everywhere in opposition. For a century they were not only to the peace of the Church but to that of the empire.

The first stage of the controversy covers the seventy-five years between the council of Chalcedon and the accession of Justinian in 527. In Palestine the fanatical monks led by Theodosius captured Jerusalem and expelled the bishop, Juvenal. When he was restored, after an exile of twenty months, Theodosius fled to Sinaí and continued his agitation among the monks there. In Alexandria an insurrection broke out over the supersession of the patriarch Dioscurus by the orthodox Proterius, who was killed during the struggle. Timothy Aelurus was chosen bishop, and a synod which he called was so powerful as to impress even the emperor Leo I. at Constantinople, who, however, deposed him as well as Peter Fullo, who at Antioch had usurped the see of the orthodox bishop Martyrius. The short reign of Basiliscus (474-476) favoured the Monophysites, but the restoration of the rightful emperor Zeno marked an attempt at conciliation. On the advice of Acacius, the energetic patriarch of Constantinople, Zeno issued the Henothikon edict (482), in which Nestorius and Eutyches were condemned, the twelve chapters of Cyril appended to the Chalcedon definition ignored. The synod of the twenty-six persons in the dispute was quite in vain. Pope Felix III. saw the prestige of his see involved in this sifting of Chalcedon and his predecessor Leo's epistle. He condemned and deposed Acacius, a proceeding which the latter regarded with contempt, but which involved a breach between the two sees that lasted after Acacius's death (489), through the long and troubled reign of Anastasius, and was only healed by Justin I. in 519. The monophysite cause reached its crowning point in the East when Severus was made bishop of Antioch in 533. This man was the stormy petrel of the period. A law student who had been converted from paganism, he became a monophysite monk at Alexandria. Expelled from that city in 533, he went with his followers to stir up strife in Constantinople, and succeeded in bringing about the deposition of the orthodox bishop, Macedonius, and of Flavian, bishop, of Antioch. But Severus himself was deprived in 518: he went back to Alexandria, and became leader of the Phthartalatrai (see below), a subsection of the Monophysites.

Justin I. was only a tool in the hands of his nephew Justinian, who sided with the orthodox and brought about the reconciliation between Roman and Constantinople. In Jerusalem, Tyre, and other centres also, orthodoxy was re-established. In Egypt, however, monophysitism was as strong as ever, and soon at Constantinople the arrogance of Rome caused a reaction, led by Theodore, the wife of the new emperor Justinian (527-565). Justinian himself, with the aid of Leontius of Byzantium (c. 485-543), a monk with a decided turn for Aristotelian logic and metaphysics, had tried to reconcile the Cyrillic and
In Islam development unnum Creator.

further, transmuted Alexandria body and, written his epistle... monophysite Aphthartodocetae sites. Chalcedonian... represented...... Cyril, the followers of... Med... "Abbot,...... Hence Agnetae and their excommunication.

An opposite tendency was that of the Aphthartodocetae or Phantasistae, represented by Julian, bishop of Halicarnassus, and, in his closing days, by Justinian. They held that Christ's body was so inseparably united with the Logos as not to be consubstantial with humanity; its natural attributes were so heightened as to make it sinless and incorruptible. An extreme school, the Aktistae or Gaianists (Gaianus was bishop of Alexandria c. 550) even held that from the moment the Logos assumed the body the latter was uncreated, the human being transmuted into the divine nature; and the Adiaphorites went still further, denying, like Stephen Barusaudai, an Edessan abbot, all distinction of essence not even between the manhood and the Godhead in Christ, but between the divine and the human, and asserting that "all creatures are of the same essence with the Creator."

A third variety of monophysitism was that known as theo- phaschism, a name given to those who accepted the formula that in the death of Christ "God had suffered and been crucified." Peter Fullo introduced these words into the Trisagion, and after much controversy the council of Constantinople (553), while disallowing this, gave its sanction to the similar statement... um crucifixum esse ex sancta et consubstanti Trinitate. The development of this line of thought led in some thinkers like John Philoponus to a kind of tritheism.

There is no doubt that the disintegration caused by monophysitism largely facilitated the rapid and easy victory of Islam in Syria and Egypt. The "ethical complement" of monophysitism is monothelitism (see MONOTHELITISM).

MONPOLY, a sea-port town and episcopal see of Apulia, Italy, in the province of Bar, from which it is 25 m. S.E. by rail, 30 ft. above sea-level. Pop. (1901), 22,616. The medieval walls are preserved and the castle dates from 1552. The harbour is small, the principal trade being in agricultural products. Close to it are rock-hewn tombs, possibly belonging to the ancient Gnathia (q.v.).

MONPOLY (Gr. μονοπολία or μονοπόλιον, exclusive sale, from μόνος, alone, and πώλειν, to sell), a term which, though used generally in the sense of exclusive possession, is more accurately applied only to grants from the Crown or from parliament, the private act of an individual whereby he obtains control over the supply of any particular article, being properly defined as "engrossing." It was from the practice of the sovereign granting to a favourite, or as a reward for good service, a monopoly in the sale or manufacture of some particular class of goods that the system of protecting inventions arose, and this fact lends additional interest to the history of monopolies (see PATENTS). When the practice of making such grants first arose it does not appear easy to say. Sir Edward Coke laid it down that by the ancient common law the king could grant to an inventor, or to the importer of an invention from abroad, a temporary monopoly in his invention, but that grants in restraint of trade were illegal. Such, too, was the law laid down in the first recorded case, Darcy v. Allen (the case of monopolies, 1602), and this decision was never overruled, though the law was frequently evaded. The patent rolls of the Plantagenets show few instances of grants of monopolies (the earliest known is temp. Edw. III.), and we come down to the reign of Henry VIII. before we find much evidence of this exercise of the prerogative in the case of either new inventions or known articles of trade. Elizabeth, as is well known, granted patents of monopoly so freely that the practice became a grave abuse, and on several occasions gave rise to serious complaints in the House of Commons. Lists prepared at the time show that many of the commonest necessaries of life were the subjects of monopolies, by which their price was grievously enhanced. That the queen did not assume the right of making these grants entirely at her pleasure is shown, not only by her own statements in answer to questions from the house, but by the fact that the preambles to the instruments conveying the grants always set forth some public benefit to be derived from their action. Thus a grant of a monopoly to sell playing-cards is made, because "divers subjects of able bodies, which might go to plough..." and "employ themselves in the art of making of cards;" and one for the sale of starch is justified on the ground that it would prevent wheat being wasted for the purpose. Accounts of the angry debates in 1565 and 1601 are given in Hume and elsewhere. The former debate produced a promise from the queen that she would be careful in exercising her privileges; the latter a proclamation which, received with great joy by the house, really had but little effect in stopping the abuses complained of.

In the first parliament of James I. a "committee of grievances" was appointed, of which Sir Edward Coke was chairman. Numerous monopoly patents were brought up before them, and were cancelled. Many more, however, were granted by the king, and there grew up a race of "purveyors," who made use of the privileges granted them under the great seal for various purposes of extortion. One of the most notorious of these was Sir Giles Monpesq, who fled the country to avoid trial in 1621. After the introduction of several bills, and several attempts by James to compromise the matter by orders in council and promises, the Statute of Monopolies was passed in 1663. This made all monopolies illegal, except such as might be granted by parliament or were in respect of new manufactures or inventions. Upon this excepting clause is built up the entire English system of legal protection for inventions. The act was strictly enforced, and by its aid the evil system of monopolies was eventually abolished. Parliament has, of course, never exercised its power of granting to any individual exclusive privileges of dealing in any articles of trade, such as the privileges of the Elizabethan monopolists; but the licences required to be taken out by dealers in wine, spirits, tobacco, &c., are lineal descendants of the old monopoly grants, while the quasi-monopolies enjoyed by

MONOTHELITES—MONOTREMATA

railways, canals, gas and water companies, &c., under acts of parliament, are also representative of the ancient practice.

MONOTHELITES (μονοθελητας, monothelitēs, from Gr. μονθελος, only, θελη, to will), 1 in Church history, the name given to those who, in the 5th century, while otherwise orthodox, maintained that Christ had only one will. Their effort, as defined by de Wet, was "an attempt to find an orthodox solution of the vital unity of Christ's person, which had been so seriously proposed by monophysitism, on the basis of the now firmly-established doctrine of the two natures." The controversy had its origins in the efforts of the emperor Heraclius to win back for the church and the empire the excommunicated and persecuted Monophysists or Eutychians of Egypt and Syria. In Egypt especially the monophysite movement had assumed a nationalistic, patriotic character. It was in Armenia, while on his expedition against Persia, in 622 that, in an interview with Paul, the head of the Severians (Monophysites) there, Heraclius first broached the doctrine of the μαθημα της θεου μονοθελητος (μονοθελητας) of Christ, i.e. the doctrine that the divine and human natures, while quite distinct in His one person, had but one activity and operation. 2 At a somewhat later date he wrote to Arcadius of Cyprus, commanding that "two energies" should not be spoken of; and in 626, while in Lazia (Colchis), he had a meeting with the metropolitan, Cyprus of Phasis, during which this command was discussed, and Cyprus was at last bidden to seek further instruction on the subject from Sergius, patriarch of Constantinople, a strong upholder of the μαθημα της θεου μονοθελητος, and the emperor's counsellor in the matter. After this, he, in the following year, being appointed he received a friendly reply. 3 Sergius, however, who meanwhile had been made patriarch of Jerusalem (634), refused to be silenced, and in his Epistola synodica strongly insisted on the "two energies." So intense did the controversy now become, that at last, towards the end of 638, Heraclius published an Euchesis, or Exposition of the Faith (composed by Sergius), which prohibited the use of the phrase "one energy," because of its disquieting effects on some minds, as seeming to militate against the doctrine of the two natures; while, on the other hand, the expression "two energies" was interdicted because it seemed to imply that Christ had two wills. That Christ had but one will was declared to be the only orthodox doctrine, and all the faithful were enjoined to hold and teach it without addition or deduction. The document was not acceptable, however, to Popes Severinus and John IV., the immediate successors of Honorius; and Maximus, the confessor, in stirring up such violent opposition in North Africa and Italy that, in 648, Constans II. judged it expedient to withdraw his grandfather's edict, and to substitute for it his own Typus or Precept (τυπος και πρεπτος), forbidding all discussion of the questions of the duality or singleness of either the energy or the will of Christ. The scheme of doctrine of the first four general councils, in all its vagueness as to these points, was to be maintained; so far as the controversy had gone, the disputants on either side were to be held free from censure, but to resume it would involve penal consequences. The reply of the Western Church was promptly given in the unambiguously dyothelite decrees of the Lateran synod held by Pope Martin I. in 649; but the cruel persecutions to which both Martin and Maximus were subjected, and finally succumbed, for the imperial Typus the assent at least of silence. With the accession of Constantine Pogonatus in 668 the controversy once more revived, and the new emperor resolved to summon a general council. It met at Constantinople in 680, having been preceded in 679 by a brilliant synod under Pope Agatho at Rome, where it had been agreed to depart in nothing from the decrees of the Lateran synod. The will, Agatho said, is a property of the nature, so that as there are two natures there are two wills; but the human will determines itself ever conformably to the divine and almighty will.

MONOTREMATA (a name referring to the single outlet for all the excretory channels of the body), the lowest subclass of the Mammalia, represented at the present day solely by the platypus and the echidnas. It has been proposed to replace this name, when used as a subclass, by Prototheria; but it is perhaps on the whole preferable to retain it both for the subclass and for the single order which it now represents, distinguishing the latter as Monotremata vera.

Existing monotremes are characterized by the following features. In the first place they differ broadly from all other mammals in being oviparous, or possibly in the case of one family ovoviviparous; and also in the absence of mammae, or teats, the milk-glands opening on the surface of the skin of the breast by means of a number of fine pores. Moreover, the milk-glands themselves are commonly believed to represent sweat-glands and not those of other mammals, although it has been suggested that this distinction may not prove to be valid. In the strict sense of the term monotremes are not, therefore, mammals at all. Another feature in which these creatures differ from all other living mammals is the presence of a pair of caecoid bones, which articulate with the sternum, or breastbone, as well as of paired precoracoids, or epiporacoids, and an unpaired T-shaped interclavicle, the arms of which overlie the clavicles or collar-bones. In all these respects monotremes closely resemble many reptiles. The brain lacks a corpus callosum, or band of nerve-tissue connecting the two hemispheres. The bodies of the vertebrae are for the most part without terminal caps, or epiphyses; and each of them articulates to the vertebral column solely by its head or capitus and a tuberculum. More important is the circumstance that the testes, which remain throughout life within the abdominal cavity, do not discharge by means of their ureters into a urinary bladder, but into a urino-genital sinus, which is in close communication with the lower end of the alimentary canal, so that the genital and waste products of the body are discharged by means of a common tube, or cloaca—another reptilian feature, although met with in certain other mammals. As regards other soft parts, the heart has the valve dividing the right auricle and ventricle incomplete and to a great extent fleshy—a feature which may, in some degree, account for the lower temperature of monotremes as compared with higher mammals. The presence of an anterior abdominal vein, or at least its supporting membrane, running right through the abdominal cavity, is another distinctive feature of the group. Of less importance is the presence of a pair of epibulbic, or marupusal, bones attached to the front edge of the pelvis. The females have a complete or rudimentary pouch on the abdomen.

In the presence of hair, the relatively high temperature of the blood, the absence of nuclei to the red blood-corpuscles, and the existence of only the left aortic arch, as well as in the absence of a separate quadrate-bone, and the simple structure of the lower jaw, monotremes conform to the ordinary mammalian type. On the other hand the skull of the platypus possesses a peculiar "dumb-bell bone," believed to represent the reptilian precursor.

1 The name seems to occur first in John of Damascus.

2 Paul, speaking for the monophysite bishops, had said that what was particularly repugnant in the definition of Chalcedon (Gx.) was the implication of two wills in Christ. See Hefele, Conciliengesch. iii. 124 seq. (1877), who also traces the previous history of the expressions used. See also the chapter, "Theodores fool," in the history of the Pseudo-Dionysius Areopagita, which first appeared in Egypt in the 5th century.

3 In two letters Honorius expressed himself in accord with the monothelite view, for which he was denounced as heretical by the Sixth General Council and anathematized by Pope Leo I.
The females produce their young from eggs, which are relatively large, and develop in the same manner as those of birds and reptiles, a portion only of the yolk segmenting to form the embryo, while the remainder serves for the nutrition of the latter. In the case of Ornithorhynchus, it has been said that the eggs are laid at the end of the burrow, but those of the Echidnae are carried about in the pouch on the abdomen of the female, which becomes enlarged during the time of incubation. In the adult state neither of the Echidnae have been seen with eggs; but the pouch is only a specialized feature, the young platypus having functional teeth.

In the latter, the three pairs of these teeth are developed in the upper, and three in the lower jaw; but after being for some time in use, and are worn away. The lower pair is acute and slender, and between the teeth the mucous membrane is developed into the lamar of some of the extinct multituberculata (q.v.).

A peculiarity of the males is the presence in the hind-limb of an additional, flat, curved osicle on the hinder and tibial side of the planter aspect of the tarsus, articulating chiefly to the tibia, supporting in the adult a sharp-pointed perforated horn spur, with which is connected the duct of a gland situated beneath the skin of the back of the thigh. A rudimentary spur is found in the young female Ornithorhynchus and in the male Echidna. The beak is of large, delicate, and gradual form in Ornithorhynchus, but is not nearly so large as the bill of the water-rat (Hydrochoerus); under and around the teeth are developed the horny plates, or "cornules," which gradually grow round them and assume their function, the hollows on the surface of the cornules indicating the positions of the teeth. The beak is thus a homologue to the first premolars of the molar series of the class Aves, and is an approximation to the molar of some of the extinct multituberculata (q.v.).

Of the 135 species that have been classified, 10 are now known, and have been classified as platypus, and 2 as ornithorhynchus. The skin is generally smooth, with the exception of the adult female, which is furnished with a glandular secretion, and the male, which has a peculiar secretion on the head, neck, and tail. The skin is covered with fine, villous hairs, and the hairs are found in two layers. The head is large, and the body is small, but the tail is long, and is furnished with a glandular secretion, and the skin is covered with fine, villous hairs.

The trunk-vertebrae are nineteen in number. The transverse processes of the cervical vertebrae are independently developed, and remain separately connected with the sides of the vertebrae until the animal is fully grown. In this respect monotremes present an approximation to reptiles, they differ in that there is not a gradual transition from these transverse processes of the neck-vertebrae (or cervical ribs, as they may be considered) into the thoracic ribs, in the case of the monotremes the costal element is much smaller than in the other, indicative of a very marked separation of neck from thorax, not seen in reptiles. The sternal ribs are well ossified, and there are distinct, partly ossified, intermediate ribs. The braincase is twice as broad as the upper, and twice as broad as the lower, the hemispherical, flattened below, arched above, and about as broad as long. The cribiform plate of the ethmoid is nearly horizontal. The cranial walls are very thin, and smoothly rounded externally, and for in the seventh vertebra the costal element is much smaller than in the other, indicative of a very marked separation of neck from thorax, not seen in reptiles. The broad occipital region slopes upwards and forwards, and the face is produced into a long depressed beak. The bony palate is prolonged backwards, so that the posterior nares are nearly on a level with the glenoid fossa. The lower jaw, or mandible, is without a distinct ascending ramus; the coronoid process and angle being rudimentary, and the two halves loosely connected at the symphysis. The fibula has a broad, flattened process, projecting from its upper extremity above the articulation, like a olecranon.

The first family, Ornithorhynchidae, is represented solely by the duck-billed platypus, or platypus (Ornithorhynchus anatinus), in which the animal is relatively small, of the body is covered with smooth, hard, and glossy feathers, and the muzzle is expanded to form a spatulate-like beak, covered during life with a delicate sensitive skin, which dries in museum-specimens to a horny consistency. Although, as mentioned above, functional teeth are developed in the young, in the adult their function is discharged by "cornules," or horny structures—elongated, narrow and sharp-edged, along the anterior part of the sides of the mouth, and broad, flattened or molariform behind. The legs are short and adapted for swimming; the feet webbed, each with five well-developed toes armed with large claws, and beyond which in the fore-feet the interdigital membrane is extended. Vertebrae: C, 7; D, 17; L, 2; S, 2; C, 21. Acetabulum of pelvis not perforated. Tongue not extensible. Mucous membrane of small intestine covered with delicate, close-set transverse folds or ridges. Tail short, broad, and depressed. Eyes very small. Fur close and soft.

The platypus, or water-mole, is common to Australia and Tasmania, and entirely aquatic in habits, diving freely, and making its burrow in the river-banks. It feeds on insects, snails, small bivalve molluscs, and worms. In the adult state it becomes left nature, and it is believed that the substitution of horny plates for brittle teeth is an adaptation for cracking the shells of these creatures. (See Platypus.)

The second family, Echidnidae, has a wider geographical distribution, including Australia, Tasmania and New Guinea, and is represented by two genera. The hemispheres of the brain are large and convoluted; and the muzzle is produced into a long, tapering, tubular beak, at the end of which the nostrils are situated. The two branches of the lower jaw are slender and rod-like. Opening of mouth small, and placed below the extremity of the beak. No teeth, though the palate and tongue are furnished with spines. Tongue very long, vermiciform, slender and protracile. Lining membrane of small intestine villous, but without transverse folds. Feet with long strong claws for scratching and burrowing. The hind-feet with the ends of the toes turned outwards and backwards in the ordinary position of the animal when on the ground. Tail very short. Acetabulum with a large perforation. Calcaneal spur and gland of the male much thicker than in Ornithorhynchus. Fur intermixed with strong, sharp-pointed spines. Terrestrial and fossorial in habits, feeding exclusively on ants.

The typical genus Echidna is represented by the echidna, or porcupine-anteater (E. aculeata), which has a distribution equivalent to that of the family, and includes several local races. It is characterized by the presence of five claws to each foot, the moderately long and straight beak, the tapering tongue, with its spines restricted to the basal portion, and the vertebrae numbering C, 7, D, 16; L, 3; S, 3; C, 12. In Echidna, represented by the larger P. bruijni and P. nigroaculeata, both from New Guinea, on the other hand, terminal phalanges and claws are present only on the three middle toes of each foot, the tongue is somewhat spoon-shaped and carries three rows of spines along its upper surface, and there are 17 dorsal and four lumbar vertebrae. (See Echidna.)

At present no light is shed by palaeontology on the past history of the Monotremata Vera. Species of Echidna and Ornithorhynchus have indeed been described from the superficial formations of Australia, but they apparently differ in no structural details from their existing representatives.

Possibly some of the extinct Jurassic mammals with a marupial or insectivorous type of dietination referred to in the article Marsupialia may be monotremes, but there is no definite evidence that this is the case. On the other hand, there is a possibility that another extinct group of mammals, dating from the Trias and continuing till the Lower Eocene, may belong to the present subclass, of which they form a second order. (See Multituberculata.)

The most important recent information with regard to the Monotremata will be found in Dr R. Semen’s Reise in Australien, in the Denkschrift of the Jena Natural History Society. (R. L.*

MONOTRIGLYPH, in architecture, the interval of the intercolumniation of the Doric column, which is observed by the intervention of one triglyph only between the triglyphs which come over the axes of the columns. This is the usual arrangement, but in the Propylaeum at Athens there are two triglyphs over the central intercolumniation, in order to give increased width to the roadway, up which chariots and beasts of sacrifice ascended.

MONOTYPIC (Gr. μόδος, alone, single, and τύχος, a type), a term used in biology, &c., for subjects having only one exponent, for example a genus containing only one species.
MONREALE—MONROE

MONREALE (contraction of monte-reale, so called from a palace built here by Roger I.), a town of Sicily, in the province of Palermo, 5 m. inland (W.S.W.) from it, on the slope of Monte Cofano, overlooking the beautiful and very picturesque "La Conca d'ORO" (the Golden Shell), famed for its orange, olive and almond trees, the produce of which is exported in large quantities. Pop. (1901), 17,379 (town); 23,556 (commune).

The town, which for long was a mere village, owed its origin to the founding of a large Benedictine monastery, with its church, the seat of the metropolitan archbishop of Sicily. This, the greatest of all the monuments of the wealth and artistic taste of the Norman kings in northern Sicily, was begun about 1170 by William II., and in 1182 the church, dedicated to the Assumption of the Virgin Mary, was, by a bull of Pope Lucius III., elevated to the rank of a metropolitan cathedral.

The archiepiscopal palace and monastic buildings on the south side were of great size and magnificence, and were surrounded by a massive precinct wall, crowned at intervals by twelve towers. This has been mostly rebuilt, and but little now remains except ruins of some of the towers, a great part of the monks' dormitory and frater, and the splendid cloister, completed about 1200. This last is well preserved, and is one of the finest cloisters both for size and beauty of detail now extant. It is about 170 ft. square, with pointed arches, decorated, and the pillars are of marble in white, 216 in all, which were alternately plain and decorated by bands of patterns in gold and colours, made of glass tesserae, arranged either spirally or vertically from end to end of each shaft. The marble caps are each richly carved with figures and foliage executed with great skill and wonderful fertility of invention—no two being alike. At one angle, a square pillared projection contains the marble fountain or monks' lavatory, evidently the work of Moselem sculptors.

The church is fortunately well preserved. In plan it is a curious mixture of Eastern and Western arrangement. The nave is like an Italian church, while the large triple-apsed choir is like one of the early three-apsed churches, of which so many examples still exist in Syria and other eastern countries. It is, in fact, like two quite different churches put together endwise. The basilican nave is divided with narrows aisles. Monolithic columns of grey orient granite (except one, which is of cipollino), evidently the spoils of older buildings, on each side support eight pointed arches much shelled. The capitals of these (mainly Corinthian) are also of the classical period. There is no triforium, but a high clerestory with stained glass windows, which is seen to advantage by the sculptures of the nave-aisles and throughout the church, which give sufficient if anything too much light). The other half, Eastern in two senses, is both wider and higher than the nave. It also divides into a central chancel, flanked by aisles and a pair of side aisles, and another nave with an apse. The roofs throughout are of open woodwork very low in pitch, constructed only, but richly decorated with colour, now most restored. At the west end of the nave are two projecting, very figures of those who prophesied and prophesied for his coming. Towards the east are subjects from the New Testament, chiefly representing Christ's miracles and suffering, with apostles, evangelists and other saints. The design, execution and choice of subjects all appear to be of Byzantine origin, the subjects being selected from the Menologium drawn up by the emperor Basilus Porphyrogenitus in the 10th century.

In the central apse at Monreale, behind the high altar, is a fine marble throne for the archbishop. This position of the throne is a survival of the early basilican arrangement, when the apse and altar were at the west end. In that case the celebrant stood behind the high altar and the congregation in front of it. On the north side, in front of the high altar, is another somewhat similar throne for the use of the king. The tomb of William I., the founder's father—a magnificent porphyry sarcophagus contemporary with the church, in a niche in the wall of the right-hand nave, William II.'s tomb, erected in 1182, was shattered by a fire, which in 1191 broke out in the choir, injuring some of the mosaics, and destroying all the fine walnut choir-fittings, the organs, and most of the choir stalls. The choir, mutilated by the fire, was restored after the 12th century, and was the injured part of the church restored, mostly very clumsily, a few years after the fire. On the north of the choir are the tombs of Margaret, wife of William I., and her two sons Roger and Henry, containing the viscera of St Louis of France, who died in 1270. The pavement of the triple choir, though much restored, is a very magnificent specimen of marble and porphyry mosaic in opus alexandrinum, with signs of Arab influence in its design. The pavement of the nave, on the other hand, is of the 16th century. Two bronze doors, those on the north and west of the church, are of great interest in the history of art. They are both divided into a number of square panels with subjects and single figures, chiefly from Bible history, cast in relief. That on the north is by Barisano of Trani in southern Italy, an artist probably of Greek origin, and a pupil of Hugues of Vitry, and is, with the other doors and a pulpit, the work of the cathedrals at Trani and Ravello also have bronze doors by the same sculptor. The western door at Monreale, to the northern one both in richness of design and in workmanship, is by Bonanus of Pisa, for the cathedral of Trani, and dates from about 1200. The pointed arches of the nave and aisles are 12th and 14th centuries, which are fortunately shut off from the rest of the church.

J. H.M.; T. A.

MONROE, DAVID BINNING (1836-1905) English Homicide scholar, was born in Edinburgh on the 16th of November 1836. He was a grandson of Alexander Monro, tertius (1733-1859), professor of anatomy in Edinburgh University, whose father, Alexander Monro, secundus (1733-1817), and grandfather, Alexander Monro, primus (1670-1767), both filled the same position. He was educated at Glasgow University, and and Balliol College, Oxford. In 1859 he was elected fellow, and in 1882 provost of Oriol, which office he held till his death at Heiden, Switzerland, on the 22nd of August 1905. He was a man of varied attainments, an excellent linguist, and possessed considerable knowledge of music, painting and architecture. His favourite study was Homer, and his Grammar of the Homeric Dialect (2nd ed., 1891) established his reputation as an authority on that author. He also edited the last twelve books of the Odyssey, with valuable appendices on the composition of the poem, its relation to the Iliad and the cyclic poets, the history of the text, the dialects, and the Homeric house; a critical edition of the poems and fragments (Homeri opera et reliquiae, 1866; Homer Opera et Reliquiae, 2nd ed., 1890); and W. Allen, in Scriptores veteris classici corpora litterarum antiquorum); and a translation of the Iliad with notes for schools. His article on Homer, written for the 9th edition of the Encyclopaedia Britannica, was revised by him for this work before his death. Mention may also be made of his Modes of Ancient Greek Music (1804), on which see Classical Review for December 1894, with author's reply in the same for February 1895. See Memoir by J. Cook Wilson (Oxford, 1907).

MONROE, JAMES (1758-1831), fifth president of the United States, was born on Monroe's creek, a tributary of the Potomac.
MONROE

river, in Westmoreland county, Virginia, on the 28th of April 1758. His father, Spence Monroe, was of Scotch, and his mother, Elizabeth Jones, was of Welsh descent. At the age of sixteen he entered the College of William and Mary, Williamsburg, Virginia, but in 1776 he left college to take part in the War for Independence. He enlisted in the Third Virginia regiment, in which he became a lieutenant, and subsequently took part in the battles of Harlem Heights, White Plains, Trenton (where he was wounded), Brandywine, Germantown, and Monmouth. In November 1777 he was appointed volunteer aide-de-camp to William Alexander ("Lord Stirling"), with the rank of major, and thereby lost his rank in the Continental line; but in the following year, at Washington's solicitation, he received a commission as lieutenant-colonel in a new regiment to be raised in Virginia. In 1780 he began the study of law under Thomas Jefferson, then governor of Virginia, and between the two there developed an intimacy and a sympathy that had a powerful influence upon Monroe's later career.

In 1782 he was elected to the Virginia House of Delegates, and though only twenty-four years of age he was chosen a member of the House of Governors. He served in the Congress of the Confederation from 1783 to 1786 and was there conspicuous for his vigorous insistence upon the right of the United States to the navigation of the Mississippi River, and for his attempt, in 1785, to secure for the weak Congress the power to regulate commerce, in order to remove one of the great defects in the existing central government. On retiring from Congress he began the practice of law at Fredericksburg, Virginia, was chosen a member of the Virginia House of Delegates in 1787, and in 1788 was a member of the state convention which ratified for Virginia the Federal constitution. In 1790 he was elected to the United States senate to fill the vacancy caused by the death of William Grayson, and although in this body he vigorously opposed Washington's administration, Washington on the 27th of May 1794 nominated him as minister to France. It was the hope of the administration that Monroe's well-known French sympathies would secure for him a favourable reception, and that his appointment would also conciliate the friends of France in the United States. His warm reception in France and his enthusiastic Republicanism, however, displeased the Federalists at home; he did nothing, moreover, to reconcile the French to the Jay treaty (see Jay, John), which they regarded as a violation of the French treaty of alliance of 1778 and as a possible casus belli. The administration therefore decided that he was unable to represent his government properly and late in 1796 recalled him.

Monroe returned to America in the spring of 1797, and in the following December published a defence of his course in a pamphlet of 500 pages entitled A View of the Conduct of the Executive in the Foreign Affairs of the United States, and printed in Philadelphia by Benjamin Franklin Bache (1769-1798). Washington seems never to have forgiven Monroe for this, though Monroe's opinion of Washington and Jay underwent a change in his later years. In 1799 Monroe was chosen governor of Virginia and was twice re-elected, serving until 1802. At this time there was much uneasiness in the United States as a result of Spain's restoration of Louisiana to France by the secret treaty of San Felipe, in October 1800; and the subsequent withdrawal of the "right of deposit" at New Orleans by the Spanish intendant greatly increased this feeling and led to much talk of war. Resolved upon peaceful measures, President Jefferson in January 1803 appointed Monroe envoy extraordinary and minister plenipotentiary to France to aid Robert R. Livingston, the resident minister, in obtaining by purchase the territory at the mouth of the Mississippi, including the island of New Orleans, and at the same time authorized him to co-operate with Charles Pinckney, the minister at Madrid, in securing from Spain the cession of East and West Florida. On the 18th of April Monroe was further commissioned as the regular minister to Great Britain. He joined Livingston in Paris on the 12th of April, after the negotiations were well under way; and the two ministers, on finding Napoleon willing to dispose of the entire province of Louisiana, decided to proceed with their instructions and effect its purchase. Accordingly, on the 30th of April, they signed a treaty and such a bill as whereby France sold Louisiana to the United States (see Louisiana Purchase). In July 1803 Monroe left Paris and entered upon his duties in London; and in the autumn of 1804 he proceeded to Madrid to assist Pinckney in his efforts to secure the definition of the Louisiana boundaries and the acquisition of the Floridas. After negotiating with Don Pedro de Cevallos, the Spanish minister of foreign affairs, from January to May 1805, without success, Monroe returned to London and resumed his negotiations, which had been interrupted by his journey to Spain, concerning the impressment of American seamen and the seizure of American vessels. As the British ministry was reluctant to discuss these vexed questions, little progress was made, and in May 1806 Jefferson ordered William Pinckney of Maryland to assist Monroe. The British government appointed Lords Auckland and Holland as negotiators, and the result of the deliberations was the treaty of the 31st of December 1806, which contained no provision against impressments and produced no cession of war.

In passing over these matters Monroe and Pinckney had disagreed to their instructions, and Jefferson was so displeased with the treaty that he refused to present it to the senate for ratification, and returned it to England for revision. Just as the negotiations were re-opened, however, the questions were further complicated and their settlement delayed by the attack of the British ship "Leopard" upon the American frigate "Chesapeake." Monroe returned to the United States in December 1807, and was elected to the Virginia House of Delegates in the spring of 1810. In the following winter he was again chosen governor, serving from January to November 1811, and resigning to become secretary of state under Madison, a position which he held until the 3rd of March 1817. The direction of foreign affairs in the troubled period immediately preceding and during the second war with Great Britain thus devolved upon him. On the 27th of September 1814, after the disaster of Bladensburg and the capture of Washington by the British, he was appointed secretary of war to succeed General John Armstrong, and discharged the duties of this office, in addition to those of the state department, until March 1815.

In 1816 Monroe was chosen president of the United States; he received 183 electoral votes, and Rufus King, his Federalist opponent, 34. In 1820 he was re-elected, receiving all the electoral votes but one, which William Plumer (1759-1859) of New Hampshire cast for John Quincy Adams, in order, it is said, that no one might share with Washington the honour of a unanimous election. The chief events of his administration, which has been called the "era of good feeling," were the Seminole War (1817-18); the acquisition of the Floridas from Spain (1819-21); the "Missouri Compromise" (1820), by which the first conflict over slavery under the constitution was peacefully adjusted; the veto of the Cumberland Road Bill (1822) on constitutional grounds; and—most of all—

1The Cumberland (or National) Road from Cumberland, Maryland, to Wheeling, West Virginia, was projected in 1806, by an act of Congress of 1810 was extended to the Ohio River, by an act of 1825 (signed by Monroe on the last day of his term of office) was continued to Zanesville, and by an act of 1829 was extended westward from Zanesville. The appropriation of 1806 for the construction of the road had brought into national politics the question of the authority of the Federal government to make "internal improvements." The bill vetoed by Monroe would in effect have given to the Federal government jurisdiction over the road; and in his manifestoes and speeches Monroe sharply contested the propriety of the road and the use of public funds for its construction. As the veto counter was Monroe decided not to exercise jurisdiction over it, and advocated the adoption of an amendment to the constitution giving larger power to the Federal government "confined to great national works only, since, if it were extended it would be liable to abuse, and might be productive of evil." For the history of the Cumberland Road, see Archer B. Hulbert, The Cumberland Road (Cleveland, Ohio, 1904).
MONROE—MONROE DOCTRINE

intimately connected with Monroe's name—the enunciation in the presidential message of the 2nd of December 1823 of what has since been known as the Monroe Doctrine (q.v.), which has profoundly influenced the foreign policy of the United States. On the expiration of his second term he retired to his home at Oak Hill, Loundoun county, Virginia. In 1826 he became a regent of the university of Virginia, and in 1829 was a member of the convention called to amend the state constitution. Having neglected his private affairs and incurred large expenditures during his missions to Europe, he experienced considerable pecuniary embarrassment in his later years, and was compelled to ask Congress to reimburse him for his expenses in the public service. Congress finally (in 1826) authorized the payment of $30,000 to him, and after his death appropriated a small amount for the purchase of his papers from his heirs. He died in New York City on the 4th of July 1831, while visiting his daughter, Mrs Samuel L. Gouverneur. In 1858, the centennial year of his birth, his remains were reinterred with impressive ceremonies at Richmond, Virginia. Jefferson, Madison, John Quincy Adams, Calhoun, and Benton all speak loudly in Monroe's praise; but he suffers by comparison with the greater statesmen of his time. Possessing none of their brilliance, he had, nevertheless, to use the words of John Quincy Adams, "a mind ... sound in its ultimate judgments, and firm in its final conclusions." Schouler points out that like Washington and Lincoln he was "conspicuous ... for patient considerateness to all sides." Monroe was about six feet tall, but, being stoop-shouldered and rather ungainly seemed less; his eyes, a greyish blue, were deep-set and kindly; his face was delicate, naturally refined, and prematurely lined. The best-known portrait, that by Vanderlyn, is in the New York City Hall. Monroe was married in 1788 to Elizabeth Kortwright (1768–1830) of New York, and at his death was survived by two daughters.

See The Writings of James Monroe (7 vols., New York, 1898–1903), ed. by William H. Smythe; Daniel C. Verplanck, James Monroe (Boston, 1883), in the "American Statesmen Series"; J. R. Irelan, History of the Life, Administration and Times of James Monroe, being vol. v. of his Kepalais (Chicago, 1887); John Quincy Adams, The Lives of James Madison and James Monroe (Buffalo, 1859); R. Bond, Jr., Monroe's Mission to France, 1794–1796 (Baltimore, 1907); Henry Adams, History of the United States (9 vols., New York, 1889–1891), containing a full but unsympathetic account of Monroe's career as a diplomat; and his History of the United States, vols. ii. and iii. (New York, 1894), which estimates his public services highly.

MONROE, a city of Louisiana, U.S.A., the capital of Ouachita parish, in the northern part of the state, on the east bank of the Ouachita river, 72 m. W. of Vicksburg, Mississippi, and 66 m. E. of Shreveport, Louisiana. Pop. (1890), 3256; (1900), 5428 (2834 negroes); (1910), 10,209. It is served by the Arkansas, Louisiana & Gulf, the Little Rock & Monroe, the Vicksburg, Shreveport & Pacific (Queen & Crescent), and the St Louis, Iron Mountain & Southern railways, and by river steamers plying between New Orleans and Camden, Arkansas. Across the Ouachita is the town of West Monroe (pop. 1910, 1127). The improvement of the river, by the removal of snags and the construction of dams and locks in order to give it a navigable depth of 15 ft. at Monroe and 6 ft. beyond Camden, was nearly complete at the outbreak of the States civil war in 1861. Monroe lies in a level valley, and has broad streets shaded by live oaks. Among the public buildings are a handsome city-hall, a city market-house, a charity hospital and a high school. There are also a parish high school and St Hyacinth's Academy (Roman Catholic). The leading industries are the manufacture of lumber and cotton products.

In 1785, during the Spanish occupation of Louisiana, Juan Filiñol, commandant of the district of Ouachita, founded a settlement on the site of the present Monroe, which was called Ouachita Post until 1790 and then Fort Miró, in honour of the governor-general. In 1819 the place was renamed Monroe, in honour of President James Monroe, and in the following year the town was incorporated. Monroe was chartered as a city in 1871, and received a new charter in 1902.

MONROE, a city and the county-seat of Monroe county, Michigan, U.S.A., on the Kaisin river, 2 m. from Lake Erie, near the south-eastern corner of the state. Pop. (1890), 5258; (1900), 5043; (1910), 6128; (1920), 6893. It is served by the Michigan Central, the Lake Shore & Michigan Southern, the Père Marquette, and the Detroit & Toledo Shore Line railways, and by electric lines to Detroit and Toledo. There is a statue here (dedicated in 1910) of Gen. G. W. Custoe. Monroe has a German Altenheim and St Mary's academy and college for girls. The city has a large trade in farming-produce and fish, and various manufactures. The place was settled in 1783 by French Canadians and called Frenchtown. In January 1813 the inhabitants, fearing destruction from the British and their Indian allies, pleaded to the Americans for protection, and about 600 men from the army of General James Winchester (1752–1826), sent from the rapids of the Maumee river, on the 18th of January drove a small British force from the village. Three days later General Winchester arrived with 300 more men; but at dawn on the 22nd Colonel Henry A. Proctor (1787–1839) with a force of British and Indians surprised the Americans, defeated their right wing, captured General Winchester and obtained from him an order for the surrender of his entire force. In 1815 Monroe received the honor of James Monroe. In 1817 it was made the county-seat, and incorporated as a village. It was chartered as a city in 1837 (being rechartered in 1874), and as a city of the fourth class in 1895.

MONROE DOCTRINE. That the United States should avoid entangling itself in the politics of Europe was a policy recommended by Washington. The counterpart of this, that European powers should be prevented from taking a controlling share in the politics of the American continent, grew gradually as the importance and influence of the United States increased. This American attitude towards the European powers became crystallized in what is known as the Monroe Doctrine, since it was first announced officially in a concrete form, though not originated, by President Monroe. His declaration was the result of American apprehension that the combination of European powers known as the Holy Alliance would interfere with the American policy of the Spanish colonies, which had asserted their independence, to the crown of Spain. To meet and check this movement, in his message to Congress on the 2nd of December 1823, Monroe made the following pronouncement—

In the wars of the European powers in matters relating to themselves, we have never taken any part, nor does it comport with our policy so to do. It is only when our rights are invaded or seriously menaced that we resent injuries or make preparations for our defence. With the movements in this hemisphere we are of necessity more immediately connected, and can not, with safety,防腐 any interests which are connected with the independence and honour of America. To the extent of our facult or power, we shall always stand forward to maintain our own rights and those of the United States. On any attempt to extend their sway over any of our American fellow-citizens, on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered, and shall not interfere. But with the governments to have declared their independence and maintained it, and whose independence we have on great consideration and on just principles acknowledged, we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their domestic affairs, as an interference with the rights of independent nations. We shall always, as an nation, look with exactest concern upon theukan of the European powers in any other light than as the manifestation of an unfriendly disposition towards the United States. . . . It is impossible that the allied powers should extend their political system to any portion of either continent without endangering the existance of the American republics, and the happiness and safety of the people whom they profess to protect. Nor can any one believe that our Southern brethren, if left to themselves, would adopt it of their own accord. It is equally impossible, therefore, that we should behold such interposition in any form with indifference.

Earlier in the same message, while discussing negotiations for the settlement of the respective claims of Russia, Great Britain, and the United States in the north-west, Monroe also said—

In the discussion to which this interest has given rise and the arrangements by which they may be terminated, the occasion has been judged proper for asserting as a principle in which the rights and interests of the United States are involved, that the American continent, by the free and independent condition which they have
assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European powers.

With this message Great Britain was in hearty agreement. Indeed it was Canning's policy, summed up three years later by his famous reference to the necessity of calling the New World into existence to restore the balance of the Old.

This announcement of policy, it will be noticed, involved, firstly, a declaration aimed at foreign intervention in the political affairs of independent American states; secondly, a warning against future European colonization on the American continents. The first was avowedly based on the right of self-defense; it was a policy, not a law; it was not to constrain the minor republics, but to protect them. The second, as explained by John Quincy Adams, was intended to state the fact that the American continent was occupied by contiguous states, leaving no room for further colonization and introduction of foreign sovereignty. No legislative sanction was given to Monroe's statement of policy at the time, and in fact none was needed, for the mere announcement served to prevent foreign action in South America. It has never formed part of the body of International Law, being unilateral. Nor has the United States bound itself by compact with the other republics of the American continent to protect them from European aggression. Thus it hesitated to send delegates to the Panama Congress in 1826, and took no part in any congress with the Latin American states until 1889.

Nevertheless, on several occasions since its conception the Monroe Doctrine has been enforced. Its spirit permeated the Clayton-Bulwer Treaty, in which Great Britain and the United States, in 1850, mutually renounced the right of colonizing, fortifying or occupying any portion of Central America. It was enforced against Maximilian, who, by French intervention in Mexico, had been made emperor, and until the close of the American Civil War had performed been left undisturbed. Its application was unusual when de Lesseps's Panama Canal was thought possible of completion. Both Cuba and the Hawaiian Islands at various periods have felt its influence, the general, though not consistent policy of the United States being, while disclaiming the desire of annexation itself, to deny the right of any European power (except Spain in Cuba's case, until 1898) to control them. And it was applied to the claims of British Guiana to Venezuelan territory by President Cleveland's message in 1895, which proposed a commission to settle the boundary and threatened war if its line were not accepted. This commission never reported, but the disputants finally agreed to arbitrate, and the British claim was in the main upheld.

Between 1823 and 1895 the development and enlargement of this policy on the part of the United States was very striking. To prevent the overthrow of an independent republic is one thing; to interfere in the settlement of a boundary dispute between two states, also on the ground of self-defense, quite another. Yet Cleveland's doctrine met with general acceptance, and in fact it had been in a sense anticipated by President Grant, who, in urging the annexation of San Domingo upon the United States Senate in 1870, used this language—

The Doctrine promulgated by President Monroe has been adhered to by all political parties, and I now deem it proper to assert the equally important principle that hereafter no territory on this continent shall be regarded as subject of transfer to a European power.

Never having been formulated as law or in exact language, the Monroe Doctrine has meant different things to different persons at different times. It has become deeply rooted in the American heart, and a permanent part of the foreign policy of the United States. It tends to change into the principle that every portion of the American continent must be free from European control. It is still coupled, however, with the converse principle that relations take no part in European politics, as the disclaimer of the American delegates to the first Peace Conference at the Hague proved.

See Tucker's "Monroe Doctrine"; Gilman's "Life of Monroe"; Wharton's "International Law Digest" (title, "Monroe Doctrine"); Snow's "American Diplomacy"; also an article by Sir Frederick Pollock in the Nineteenth Century and After (1902).

(T. S. W.)

MONROE (1783-1843), French actor, whose real name was Claude Louis Séraphin Barizain, was born in Besançon on the 6th of December 1783, and was already playing children's parts at the time of the Revolution. He was called to the Comédie Française in 1815, and was received sociétaire in 1817. A small, active man, with mobile and expressive features and quick, nervous gestures, he was noted as the rascally servant in such plays as Le Barbier de Séville and Les Fourberies de Scapin. His son, Louis Martial Barizain (1800-1883), also called Monroe, was also an actor. He succeeded Samson as professor at the Conservatoire in 1866.

Mons (Flemish Bergen), a town of Belgium situated on a small river called the Trouile in the province of Hainaut, of which it is the capital. Pop. (1904), 27,072. Mons was the capital of the ancient countdom of Hainaut, well known in English history from the marriage of Edward III. with its Countess Philippa. The town was founded by the Countess Waudru in the 8th century, whereupon Charlemagne recognized it as the capital of Hainaut, and it has retained the position ever since. It was only in the 11th century, however, that it became the fixed residence of the counts, who had previously occupied the castle of Hornu, leaving Mons to the abbey and the church of St Waudru. Regnier V. moved to Mons at the beginning of that century, and his only child—a daughter—Richilde, married Baldwin VI. of Flanders. The junction of the two countdoms was only temporary, and they again separated in the person of Richilde's sons. In this age Hainaut was known as "the poor land of a proud people," and it was not until the beginning of the 14th century that Mons was converted into a trading town by the establishment of a cloth market. At the same time the count transferred his principal fortress from Valenciennes to Mons. When the Hainaut title became merged in the duchy of Burgundy, Mons was a place of considerable importance on account of its being a stronghold near the French frontier. Its capture, defence and surrender by Louis of Nassau in 1572 was one of the striking incidents of the religious troubles. In the long wars of the 17th and 18th centuries Mons underwent several sieges, but none of the same striking character as those of Namur. Several times dismantled and refortified, Mons was finally converted into an open town in 1862.

The most remarkable building in the city is the cathedral of St Waudru, named after the first countess, which was begun in the middle of the 15th century, but not finished for more than a century and a half later. It is a fine specimen of later Gothic, and contains some good glass as well as a few pictures by Van Thudden. The Hôtel de Ville is about the same age as the cathedral, having been commenced in 1458 and finished in 1566. The tower was doubled a century later. There is also a fine belfry with a peal of bells. Mons is now a flourishing town with a good trade in cloth, lace, sugar refinery, &c.; but its chief importance is derived from its proximity to the Böringae (place of boring), district containing mines of the finest coal in Belgium. The military engineering college for the Belgian army is here, and not far from Mons are the battle-fields of Malplaquet (1709) and Jemappes (1702).

MONSIEUR (Fr., formed from mon, my, and sieur, lord), the general title of address in France used vocatively in speaking formally to any male person, like the English "sir" or prefixed to the name like the English "Mr." It is, however, in France also prefixed to nobiliary, official, and other titles, e.g. Monsieur le président, Monsieur le duc d'E., &c. It is abbreviated M., not Mons. As a specific title, "Monsieur" (lord court) was used from the time of Louis XIV. of the eldest brother of the king, as "Monsieur" was of the dauphin; as a general title of address it was given to the princely members of a royal house.

Monsignor (It. monsignore, my lord), a title of honour granted by the pope to bishops and to high dignitaries and officials of the papal household. It is abbreviated Mg.
MONSON, SIR WILLIAM (c. 1569-1643), British admiral, was the third son of Sir John Monson of South Carlton in Lincolnshire, whose family was of old standing. He matriculated at Balliol College, Oxford, in 1581, but ran away to sea in 1585, being then according to his own account sixteen. His first services were in a privateer in an action with a Spanish ship in the Bay of Biscay, of which he gives a somewhat Munchausen-like account in his Naval Tracts. In the Armada year he served as lieutenant of the “Charles,” a small ship of the queen’s. There being at that time no regular naval service, Monson is next found serving with the adventurous George Clifford, 3rd earl of Cumberland (1558-1603), whom he followed in his voyages of 1589, 1591 and 1593. During the second of these ventures Monson had the ill-luck to be taken prisoner by the Spaniards in a recaptured prize, and was for a time detained at Lisbon in captivity. His cruises must have brought him some profit, for in 1595 he was able to marry, and he thought it worth while to take his M.A. degree. The earl offended him by showing favour to another follower, and Monson turned elsewhere. In the expedition to Cadiz in 1596, he commanded the “Repulse” [50]. From this time till the conclusion of the war with Spain in 1604, he was in the services of the English East India Company. In 1602 he commanded the last squadron fitted out in the reign of Queen Elizabeth. In 1604 he was appointed admiral of the Narrow Seas, the equivalent of the Channel squadron of modern times. In 1614 he was sent to the coasts of Scotland and Ireland to repress the pirates who then swarmed on the coast. Monson claimed to have extirpated these pests, but it is certain that they were numerous a generation later. After 1614 he saw no further active service till 1635, when he went to sea as vice-admiral of the fleet fitted out by king Charles I. with the first ship-money. He spent the last years of his life in writing his Tracts, and died in February 1643.

His claim to be remembered is not based on his services as a naval officer, though they were undoubtedly honourable, but on his Tracts. These treatises consist in part of historical narratives, and in part of argumentative proposals for the reform of abuses, or the development of the naval resources of the country. They form by far the best account by a contemporary of the naval life and transactions of the reign of Queen Elizabeth, and the beginning of the reign of King James. Monson takes care to do himself full justice, but he is not unfair to his contemporaries. His style is thoroughly modern, and has hardly a trace of the poetry of the Elizabethans. He was the first naval officer in the modern sense of the word, a gentleman by birth and education who was trained to the sea, and not simply a soldier put in to fight, with a sailing-master to handle the ship for him, or a tarspaulin who was a sailor only.

Monson’s elder brother, Sir Thomas Monson (1564-1641), was one of James I.’s favourites, and was made a baronet in 1611. He held a position of trust at the Tower of London, a circumstance which led to his arrest as one of the participators in the murder of Sir Thomas Overbury. He was, however, soon released and he died in May 1641. His eldest son was Sir John Monson, Bart. (1600-1683), a member of parliament under Charles I., and another son was Sir William Monson (c. 1605-1658), Vintner and East India merchant. The last named was in 1660, as Viscount Monson of Castlemaine in 1628. Having been a member of the court which tried Charles I. the viscount was deprived of his honours and was sentenced to imprisonment for life in 1661. Sir John Monson’s descendant, another Sir John Monson, Bart. (1603-1748), was created Baron Monson in 1728. His youngest son was George Monson (1730-1779), who served with the English troops in India from 1758 to 1763. The baron’s eldest son was John, the 2nd baron (1727-1774), whose son William Monson (1760-1807) served in the Maharatta War under General Lake. William’s only son William John (1796-1862) became 6th Baron Monson in succession to his cousin Frederick John, the 5th baron, in October 1841. His son William John, the 7th baron (1829-1898), was created Viscount Oxenbridge in 1886. When he died without sons in 1898 the viscountcy became extinct, but the barony descended to his brother Debonnaire John (1850-1900), whose son Augustus Debonnaire John (b. 1868) became 9th Baron Monson in 1900. Another of Viscount Oxenbridge’s brothers was Sir Edmund John Monson, Bart. (b. 1834), who, after filling many other diplomatic appointments, was British ambassador in Paris from 1896 to 1904.

The one authority for the life of Sir William Monson is his own Tracts, but a very good account of him is included by Southey in his Lives of the Admirals, vol. v. The Tracts were first printed in the third volume of Churchill’s Voyages, but they have been edited for the Navy Record Society by Mr Oppenheim.

MONSOON (Arabic Monsim, season), the name given to seasonal winds due to differences of pressure between areas of land and sea, which are primarily caused by seasonal differences of temperature. Monsos may be regarded as the seasonal analogue of the diurnal land and sea breezes. The term is, however, also applied to seasonal winds which change in direction on account of the migrations of wind-belts in the planetary circulation. During the season of rising temperature the surface of the land warms more quickly, and becomes hotter than that of the sea, and during the season of falling temperature the sea becomes cooler than the land; the result is a barometric pressure tends to be higher over the cooler land than over the warmer, and there is accordingly a tendency for air to flow, in the lower layers of the atmosphere, from the former towards the latter. Thus there is in general a movement from land to sea during the cold season, and from sea to land during the warm season.

Within a belt extending from 10 to 15 degrees on each side of the equator, seasonal changes of temperature are insufficient in range to permit of the occurrence of temperature differences adequate to the development of true monsoons. In the higher latitudes of the west wind-belt, and in the polar zones, the generally low temperature does not favour the occurrence of wide differences between land and sea. Thus the conditions required for the occurrence of monsoonal winds are best satisfied in intermediate latitudes in the neighbourhood of the tropics. But, as in the case of land and sea breezes, the strength and extension of the monsoon produced by the action described depends to a large extent on the configuration of the land surface. When the land area consists of a low plain, or of a plateau having a steep coastal strip of small width, the circulation upon it tends to be local, and to take the line of the typical “continental” climate of the temperate zones. Where, on the other hand, the land slopes upwards gradually to a central massif or ridge the effect of the differences of temperature is, as it were, cumulative, and the monsoons may extend over large areas, affecting regions distant from those in which the causes producing them are directly operative, and the monsoon winds may develop great strength. Ferrel (Popular Treatise on the Winds) has compared the conditions in the two cases to those of a stove with a long horizontal flue and with a vertical or inclined flue of the same length.

It is of course to be noted that the hot season monsoon is in general of greater strength than that of the cold season, because being usually a sea wind the air is fully charged with moisture, condensation takes place as ascensional movement sets in on reaching the land, and the latent heat set free strengthens the upward current.

The position, line and relief of the continent of Asia favour the development of monsoons to a much greater extent than any other part of the world; so much so that the climate of the whole of the southern and eastern parts is entirely controlled by these winds, forming what is typically known as “the monsoon region,” a region having distinctly characteristic products. Monsos form an important element in the climate of Australia, western and southern Africa, and the southern part of the United States of America, but with a few exceptions the monsoons of those regions are local in character, modifying the prevailing winds of the planetary circulation (usually the trade winds) for a longer or shorter period every year.

MONSTER (Lat. monstrum, from root of monere, to warn; i.e. something terrible or portentous). In zoology, monsters or monstrous births are the subject of Animal Teratology, a
department of morphological science treating of deviations from the normal development of the embryo. The term "embryo" is conventionally limited, in human anatomy, to the ovum in the first three months of its intra-uterine existence, while it is still developing or acquiring the rudiments of its form, the term "foetus" being applied to it in the subsequent months during which the organism grows on the lines of development already laid down. It is mostly in the first or embryonic period that those deviations from the normal occur which present themselves as monstrosities at the time of birth; these early traces of deviation within the embryo may be slight, but they "grow with its growth and strengthen with its strength," until they amount to irreparable defects or accretions, often incompatible with extra-uterine life. The name of "teratology," introduced by Étienne Geoffroy St Hilaire (1822), is derived from τέρας, the equivalent of monstrum; teratology is a term new enough to have none but scientific associations, while the Latin word has a long record of superstitions identified with it. The myths of sirens, sat in the class, and the like, with the corresponding figures in Northern mythology, find a remote anatomical basis in monstrosities which have, for the most part, no life except in the fetal state. The mythology of giants and dwarfs is, of course, better founded. The term monster was originally used in the same sense as portent. Luther speaks of the birth of a monstrous calf, evidently the subject of contemporary talk, as pointing to some great impending change, and he expresses the hope that the catastrophe might be the Last Day itself. The rise of more scientific views will be sketched in the course of the article. Although monstrosities, both in the human species and in other animals, tend to repeat certain definite types of erroneous development, they do not fall readily into classes. The most usual grouping (originally suggested by G. L. Buffon, 1800) is into monstra per excessum, monstra per defectum, and monstra per fabricum alienum. It seems useful, however, to place the monstrosities under the headings of excess and of defect, which latter is defined as anything out of the normal proportions of the parts, whether of the head, the trunk, or the extremities. A monstrous proportion is defined as any part of the body which is more than twice, or less than half, the size of the corresponding part of the normal embryo. If a part is more than twice, or less than half, the part is said to be redundant or defective, respectively. The antecedent of this excess or defect is usually an abnormality, which is defined as any deviation from the normal development of the embryo. The term "abnormality" is also used to describe deviations from the normal development of the body, which are not due to external causes, and which are not incompatible with extra-uterine life. The term "monstrosity" is used to describe deviations from the normal development of the body, which are both abnormal and incompatible with extra-uterine life. The term "monstrosity" is also used to describe deviations from the normal development of the body, which are both abnormal and incompatible with extra-uterine life, but which are not due to external causes. The term "monstrosity" is also used to describe deviations from the normal development of the body, which are both abnormal and incompatible with extra-uterine life, but which are not due to external causes, and which are not incompatible with extra-uterine life. The term "monstrosity" is also used to describe deviations from the normal development of the body, which are both abnormal and incompatible with extra-uterine life, but which are not due to external causes, and which are not incompatible with extra-uterine life.

**MONSTER**

Dwarfs are conventionally limited to persons under 4 ft. They are more likely than giants to have the modulus of the body perfect. Where disproportion occurs in the true dwarf it takes the form of a large-sized head, broad shoulders and capacious chest, and undersized lower limbs. Dwarfs with rickets are perhaps to be distinguished from true dwarfs; these are cases in which the spine is curved, and sometimes the bones of the limbs bent and the pelvis deformed. As in the case of giants, dwarfs are seldom the progeny of dwarfs, who are, in fact, usually sterile; the unnatural smallness may be obvious at birth, but is more likely to make itself manifest in the years of growth. Dwarfs are much more easily brought up than giants, and are stronger and longer-lived; they have usually also strong passions and acute intelligence. The legends of the dwarfs and giants are on the whole well based on fact. (See Dwarf and Giant.)

Reudancy and Defect in Single Parts.—The simplest case of this redundancy is a sixth digit, well formed, and provided with muscles (or tendons), nerves, and bloodvessels like the others; it is usually a repetition of the little finger or toe, and it may be present on one or both hands, or on one or both feet, or in all four extremities, as in the giant of Gath. The want of one, two, or more digits on hand or foot, or on both, is another simple anomaly; and, like the redundancy, it is apt to repeat itself in the same family. J. F. Meckel saw a girl who had an extra digit on each extremity, while a sister wanted four of the fingers of one hand. Where the supernumerary digits are more than one on each extremity, the whole set are apt to be rudimentary or stunted; they look as if two or more of the embryonic buds had been subject to cleavage down the middle and to arrest of longitudinal growth. There are several authentic instances of a whole lower limb appearing at birth as two withered halves, as if from embryonic cleavage. Other redundancies of the skeleton are extra vertebrae (sometimes the coccygeal, giving the appearance of a rudimentary tail), or an extra rib. A double row of teeth is occasionally met with; the most interesting case of this anomaly is that in which the rudiments of a double row exist from the first, but the phenomenon is sometimes produced by the milk teeth persisting along with the second set. Among redundancies of the soft parts, by far the most frequent relate to the mammary glands and especially to the nipples. These organs are normally paired amongst mammals, and the glands of each pair are placed symmetrically on a curved line running from the axilla towards the pubes. When many pairs occur, the glands of each pair diverge less from the median line than those of the immediately anterior pair, the abdominal glands lying close together, those towards the axilla being farther apart. When only a single pair is normally present, the pair is abdominal, pectoral or axillary; and whether the normal be one pair or many pairs, additional glands are not infrequent, but occupy the expected position on the mammary line. Accessory glands or nipples in human beings, if anterior to the normal pair, lie either from the median line or lateral line, and vice versa. Among the sense-organs there is a remarkable instance recorded of doubling of the appendages of the left eye, but not of the eyeball itself; the left half of the frontal bone is double, making two eye-sockets on that side, and the extra orbit has an eyelid and eyelashes. The external ear (pinna) has also been found double on one side and its orifice has frequently been found doubled in man and lower animals, and the additional ears lie in a definite relation to the branchial clefts of the embryo. Doubling of any of the internal organs or parts of organs may occur and innumerable cases have been recorded.

**Montrosities from Defective Closure in the Middle Line.**—Under this head come some of the commonest congenital malformations, including slight deficiencies such as harelip, and serious defects such as a gap in the crown of the head with absence of the brain. The embryo is originally a circular flattened disk spread out on one pole of the yolk, and it is formed into a cylindrical body (with four appendages) by the free margins of the disk, or rather its ventral laminae, folding inwards to meet in the middle line and so close in the pelvic, abdominal, thoracic,
pharyngeal and oral cavities. Meanwhile, and indeed rather earlier, two longitudinal parallel ridges on the top or along the back of the disk have grown up and united in the middle line to form the cartilaginous core of the body—the neural canal—of small and uniform width in the lower three-fourths or spinal region, but expanding into a wide chamber for the brain. This division into neural (dorsal) and haemal (ventral) canals underlies all vertebrate development. Imperfect closure along either of those embryonic lines of junction may produce various degrees of monstrosity. The simplest and commonest form, hardly to be reckoned in the present category, is harelip with or without cleft palate, which results from defective closure of the ventral laminae at their extreme upper end. Another simple form, but of much more serious import, is a gap left in the neural canal at its lower end; usually the arches of the lumbar vertebrae are deficient, and the fluid that surrounds the spinal cord bulges out in its membranes, producing a soft tumour under the skin at the lower part of the back. This is the condition known as *hydrorachidias*, depending on the osseous defect known as *spina bifida*. More rarely the gap in the arches of the vertebrae is in the upper part of the neck. If it extend all along the back, it will probably involve the skull also. Deficiency of the crown of the head, and in the spine as well, may be not always traceable to want of formative power to close the canal in the middle line; an over-distended condition of the central canal of the cord and brain may prevent the closure of the bones, and ultimately lead to the disruption of the nervous organs themselves; and injuries to the mother, with inflammation set up in the foetus and its appendages, may be the more remote cause. But it is by defect in the middle line that the mischief manifests itself, and it is in that anatomical category that the malformations are included. The osseous deficiency at the crown of the head is usually accompanied by want of the scalp, as well as of the brain and membranes. The bones of the face may be well developed and the features regular, except that the eyeballs bulge forward under the closed lids; but there is an abrupt horizontal line above the orbits where the bones cease to form, and the brow joining on to a spongy kind of tissue that occupies the sides and floor of the cranium. This is the commonest form of an *anencephalus* or brainless monster. There are generally mere traces of the brain, although, in some rare and curious instances, the hemispheres are developed in an exposed position on the back of the neck. The cranial nerves are usually perfect, with the exception sometimes of the optic (and retina). Vegetative existence is not impossible, and a brainless monster has been known to survive sixty-five days. The child is usually a very large one.

Closely allied, as we have seen, to the anencephalous condition is the condition of congenital *hydrocephalus*. The nervous system at its beginning is a neural canal, not only as regards its bony covering, but in its interior; a wide space lined by ciliated epithelium and filled with fluid extends along the axis of the spinal cord, and expands into a series of chambers in the brain. As development proceeds the walls thicken at the expense of the internal spaces, the original tubular or chambered plan of the central nervous system is departed from, and those organs assume the practically solid form in which we familiarly know them. If, however, the spaces persist in their embryonic proportions notwithstanding the thickening of the nervous substance forming their walls, there results an enormous brain which is more than half occupied inside with fluid, contained in spaces that correspond on the whole to the ventricles of the brain as normally bounded. A hydrocephalic foetus may survive its birth, and will be more apt to be affected in its nutrition than in its intelligence. In many cases the hydrocephalic condition does not come on till after the child is born.

Returning to the ventral middle line, there may be defects of closure below the lips and palate, as in the breast-bone (fissure of the sternum), at the navel (the last point to close in any case), and along the middle line of the abdomen generally. The commonest point for a gap in the middle line of the belly is at its lower part, an inch or two above the pubes. At that point in the embryo there issues the allantois, a balloon-like expansion from the ventral cavity, which carries on its outer surface bloodvessels from the embryo to interdigitate with those of the mother on the uterine surface. Having served its temporary purpose of carrying the bloodvessels across a space, the balloon-like allantois collapses, and rolls up into the rounded stem-like umbilical cord through most of its extent; but a portion of the sac within the body of the foetus is retained as the permanent urinary bladder. That economical adaptation of a portion of a vesicular organ, originally formed for purposes of communication between the embryo and the mother, appears to entail sometimes a defect in the wall of the abdomen just above the pubes, and a defect in the anterior wall of the bladder itself. This is the distressing congenital condition of fissure of the urinary bladder, in which its interior is exposed through an opening in the skin; the pubic bones are separated by an interval, and the reproductive organs are ill-formed; the urachus is wanting, and the umbilicus is always placed exactly at the upper end of the gap in the skin. A monstrosity recalling the cloacal arrangement of the bird is met with as a more extreme defect in the same parts.

**Hermaphroditism.**—Although this anomalous condition does not fall under defective closure in the middle line, it may be said to be due to a similar failure of purpose, or to an uncertainty in the *nexus formosum* at a corresponding stage of development. Strictly speaking, a hermaphrodite is a creature containing ovaries and testes—the essential organs of each sex. Evidence accumulates, however, that at least in all the higher vertebrates, including man, the sex is predetermined in the fertilized ovum, and it is more than doubtful if true hermaphroditism occurs. On the other hand, if there be no such double sex in the essential organs (as in the majority of so-called hermaphrodites) there is a great deal of doubling and ambiguity entailed in the secondary or external organs and parts of generation. Those parts which are rudimentary or obsolete in the male but highly developed in the female, and those parts which are rudimentary in the female but highly developed in the male tend in the hermaphrodite to be developed equally, and all of them badly. Amongst human beings the greater number of so-called hermaphrodites are really females, in which there is an abnormal development of the clitoris, but it also happens that true males may be born with a small clitoris-like penis, with hypospadis—that is to say, with imperfect urethra, open on the ventral side, and with undescended testes. Failure of the development of the testes or ovary, or their removal in the adult condition induces an ambiguous condition of the body in which the secondary sexual characters approach those of the other sex. Experimental removal of the ovaries or testes, followed by implantation of organs of the other sex, has produced an inversion of the secondary sexual characters.

**Cyclops, Siren, &c.**—The same feebleness of the formative energy which gives rise to some at least of the cases of defective closure in the middle line, and to the cases of ambiguous sex, induces also a similar imperfect separation of symmetrical parts. The most remarkable case of the kind is the cyclops monster. At a point corresponding to the root of the nose there is found a single orbital cavity, sometimes of small size and with no eyeball in it, at other times of the usual size of the orbit and containing an eyeball more or less complete. In still other cases, which indicate the nature of the anomaly, the orbital cavity extends for some distance on each side of the middle line, and contains two eyeballs lying close together. The usual nose is wanting but above the single orbital cavity there is often a nasal process on the forehead, with which nasal bones may be articulated, and cartilages joined to the latter; these form the framework of a short fleshy protuberance like a small proboscis. The lower jaw is sometimes wanting in cyclopaen; the cheek-bones are apt to be small, and the mouth a small round hole, or altogether absent; the rest of the body may be well developed. The key to the cyclopean condition is found in the state of the brain. The olfactory nerves or lobes are frequently absent; the brain is very imperfectly divided into hemispheres, and appears as a
MONSTER 743

somewhat pear-shaped sac with thick walls, the longitudinal partition of dura mater (falx cerebelli) being wanting, the surface almost unevulatted, the corpus callosum deficient, the basal ganglia rudimentary or fused. The optic chiasma and nerves are usually replaced by a single mesial nerve, but sometimes the chiasma and pair of nerves are present. The origin of this monstrosity dates back to an early period of development, to the time when the future hemispheres were being formed as protrusions from the anterior cerebral vesicle or fore-brain; it may be conceived that, instead of two distinct buds from that vesicle, there was only a single outgrowth with imperfect traces of cleavage. That initial defect would carry with it naturally the undivided state of the cerebrum, and with the latter there would be the absence of olfactory lobes and of a nose, and a single eyelid placed where the nose should have been. A cyclops has been known to live for several days. The monstrosity is not uncommon among the domestic animals, and is especially frequent in the pig.

Another curious result of defective separation of symmetrical parts is the siren form of foetus, in which the lower limbs occur as a single tapering prolongation of the trunk like the hinder part of a dolphin, at the end of which a foot (or both feet) may or may not be present. The more typical this sirens form are various: in some cases there is only one limb (thigh and leg-bones) in the middle line; in others the bones of each limb are present in more or less rudimentary condition, but adhering at prominent points of the adjacent surfaces. The pelvis and pelvic viscera share in the abnormality. A much more common and harmless case of unseparated symmetrical parts is where the hand or foot has two, three, or more digits fused together. This syndactylous anomaly runs in families.

Limbs Absent or Stunted.—Allied to these fused or unseparated states of the extremities, or of parts of them, are the class of deformities in which whole limbs are absent, or represented only by stumps. The trunk (and head) may be well formed, and the individual healthy; all four extremities may be reduced to short stumps either wanting hands and feet entirely, or with the latter fairly well developed; or the legs only may be rudimentary or wanting, or the arms only, or one extremity only. Although some of these cases have been described, their frequent or deficient formative power in the particular directions, there are others of them referable to the effects of mechanical pressure, and even to direct amputation of parts within the uterus.

Acardiac and Acranium Monsters.—It sometimes happens in a twin pregnancy that one of the embryos fails to develop a heart and a complete vascular system of its own, depending for its nourishment upon blood derived from the placenta of its well-formed twin by means of its umbilical vessels. It grows into a more or less shapeless mass, in which all traces of the human form may be lost. Other viscera besides the heart will be wanting, and no head distinguishable; the most likely parts to keep the line of development are the lumbar region (with the kidneys), the pelvis, and the lower limbs. The twin of this monster may be a healthy infant.

Reversed Position of the Viscera.—This is a developmental error associated with the retention of the right aortic arch as in birds, instead of the left as is usual in mammals. The position of all the unsymmetrical viscera is transposed, the spleen and cardiac end of the stomach going to the right side, the liver to the left, the caecum resting on the left iliac fossa, and the sigmoid flexure of the colon being attached to the right. This condition of situs inversus viscerum need cause no inconvenience; and it will probably remain undetected until the occasion should arise for a physical diagnosis or post-mortem inspection.

The causes of congenital anomalies are difficult to specify. There is no doubt that, in some cases, they are present in the sperm or germ of the parent; the same anomalies recur in several children of a family, and it has been found possible, through a variation of the circumstances, to trace the influence in some cases to the father alone, and in other cases to the mother alone. The remarkable thing in this parental influence is that the malformation in the child may not have been manifested in the body of either parent, or in the grandparents. More often the malformation is acquired by the embryo and foetus in the course of development and growth, either through the mother or in itself independently. Maternal impressions during pregnancy have often been alleged as a cause, and this causation has been discussed at great length by the best authorities. The general opinion seems to be that it is impossible to set aside the influence of subjective states of the mother altogether, but that there is no direct connexion between the cause of the subjective state and the resulting anomaly. The doctrine of maternal impressions has often been resorted to when any other explanation was either difficult or inconvenient; thus, Hippocrates is said to have saved the virtue of a woman who gave birth to a black child by pointing out that there was a picture of a negro on the wall of her chamber. Injuries to the mother during pregnancy have been unquestionably the cause of certain malformations, especially of congenital hydrocephalus. The embryo itself and its membranes may become the subject of inflammations, atrophies, hypertrophies, and the like; this causation is doubtless accountable for a good many of them. But a very large residue of malformations must be referred to variation in the embryonic cells and cell-groups. The nisses formation of the fertilized ovum is always subject to morphological laws, but, just as in extraneous growths, there may be deviations from the beaten track; and even a slight deviation at an early stage will carry with it far-reaching consequences. This is particularly noticeable in double monsters.

2. Double Monsters.—Twins are the physiological analogy of double monsters, and some of the latter have come very near to being two separate individuals. The Siamese twins, who died in 1874 at the age of sixty, were joined only by a thick fleshy ligament from the lower end of the breast-bone (xiphoid cartilage), having the common navel on its lower border; the anatomical examination showed, however, that a process of peritoneum extended through the ligament from one abdominal cavity to the other, and that the blood-vessels of the two livers were in free communication across the same bridge. There are one or two cases on record in which such a ligament has been cut at birth, one, at least, of the twins surviving. From the most intelligible form of double monstrosity, like the Siamese twins, there are all grades of fantastic fusion of two individuals into one down to the truly marvellous combination of a small body or fragment parasitic upon a well-grown infant—the condition known as foetus in foetu. These monstrosities are deviations, not from the usual kind of twin gestation, but from a certain rarer physiological type of dual development. In by far the majority of cases twins have separate uterine appendages, and have probably been developed from distinct ova; but in a small proportion of (recorded) cases there is evidence, in the placental and enclosing structures, that the twins had been developed from two rudiments arising side by side on a single blastoderm. It is to the latter physiological category that double monsters almost certainly belong, and there is some direct embryological evidence for this opinion. Allen Thomson observed in the blastoderm of a hen's egg at the sixteenth or eighteenth hour of incubation two "primitive traces" or rudiments of the backbone forming side by side; and in a goose's egg incubated five days he found on one blastoderm two embryos, each with the rudiments of upper and lower extremities, crossing or cohering in the region of the future neck, and with only one heart between them. A very large number of similar observations have been published and appear to be found in all cases where a large material is available. The developing ova of fish, available in large numbers in hatcheries, and the laboratory investigation of the chick and the frog have provided cases of almost every degree of blending. The perfect physiological type appears to be two rudiments on one blastoderm, whose entirely separate development produces twins (under their rarer circumstances), whose nearly separate development produces such double monsters as the Siamese twins, and whose less separate development produces the various grotesque forms.
of two individuals in one body. There can be no question of a literal fusion of two embryos; either the individuality of each was at no time complete, or, if there were two distinct primitive traces, the uni-axial type was approximately reverted to in the process of development, as in the formation of the abdominal and thoracic viscera, limbs, pelvis or head. Double monsters are divided in the first instance into those in which the doubling is symmetrical and equal on the two sides, and those in which a small or fragmentary foetus is attached to or enclosed in a foetus of average development—the latter class being the so-called cases of "parasitism."

Symmetrical Double Monsters are subdivided according to the part or region of the body where the union or fusion exists—head, thorax, umbilicus or pelvis. One of the simplest cases is a Janus head upon a single body, or there may be two pairs of arms with the two faces. Again, there may be one head with two necks and two complete trunks and pairs of extremities. Two distinct heads (with more or less of neck) may surmount a single trunk, broad at the shoulders but with only one pair of arms. The fusion, again, may be from the middle of the thorax downwards, giving two heads and two pairs of shoulders and arms, but only one trunk and one pair of legs. In another variety, the body may be double down to the waist, but the pelvis and lower limbs single. The degree of union in the region of the abdomen of pelvis, sometimes in a to-and-fro of two distinct organs or sets of organs in the respective cavities, or so great as to have the viscera in common; and there is hardly ever an intermediate condition between those extremes. Thus, in the Janus head there may be two brains, or only one brain. The Siamese twins are an instance of union at the umbilical region, with the viscera distinct in every respect except a slight vascular anastomosis and a common process of peritoneum; but it is more usual for union in that region to be more extensive, and to entail a single set of abdominal and thoracic viscera. The pelvis is one of the commonest regions for double monsters to be jointed at, and, as in the head and abdomen, the junction may be slight or total. The Hungarian sisters Helena and Judith (1701-1723) were joined at the sacrum, but had the pelvic cavity and pelvic organs separate; the same condition obtained in the South Carolina negroes Millie and Christina, known as the "two-headed nightingale," and in the Bohemian sisters Rosalie and Josepha. More usually the union in the pelvic region is complete, and produces the most fantastic shapes of two trunks (each with head and arms) joining below at various angles, and with three or four lower limbs. In some cases the region of fusion or the region of the waist may be in a lateral direction, sometimes downwards. A very curious kind of double monster is produced by two otherwise distinct foetuses, one of which being larger, joining at the crown of the head and keeping the axis of their bodies in a line. It is only in rare instances that double monsters survive their birth, and the preserved specimens of them are mostly of foetal size.

Unequal Double Monsters, Foetus in Foetu.—There are some well-authenticated instances of this most curious of all anomalies. The most celebrated of these parasite-bearing monsters was a Genoese, Lazarus Johannes Baptista Colloredo, born in 1716, who was figured as a child by Licetus, and again by Bartholinus at the age of twenty-eight as a young man of average stature. The parasite adhered to the lower end of his breast-bone, and was a tolerably well-formed child, wanting only one leg; it breathed, slept at intervals, and moved its body, but it had no separate nutritive functions. The parasite is more apt to be a miniature acardiac and accephalous fragment, as in the case of the one borne in front of the abdomen of a Chinaman figured by I. Geoffroy St Hilaire. Sometimes the parasite is contained in a pouch under the skin of the abdominal wall, and in another class (of which there is a specimen in the Hunterian Museum) it has actually been included, by the closure of the ventral laminae, within the abdominal cavity of the foetus—a true foetus in foetu. Shapeless parasitic fragments containing masses of bone, cartilage and other tissue are found also in the space behind the breast-bone (mediastinal teratoma), or growing from the base of the skull and protruding through the mouth ("epignathous teratoma," appearing to be seated on the jaw), and, most frequently of all, attached to the sacrum. These last pass by a most interesting transition into common forms of congenital sacral tumours (which may be of enormous size), consisting mainly of one kind of tissue having its physiological type in the curious gland-like body (coccygeal gland) in which the middle sacral artery comes to an end. The congenital sacral tumours have a tendency to become cystic, and they are probably related to the more perfect congenital cysts of the neck region, where there is another minute gland-like body of the same nature as the coccygeal at the point of bifurcation of the common carotid artery. Other tumours of the body, especially certain of the sarcomatous class, may be regarded from the point of view of monstrosus per excessum; but such cases suggest not so much a question of aberrant development within the blastoderm as of the indwelling spontaneity of a single post-embryonic tissue. (See TUMOUR AND PATHOLOGY.)

Monstrosities in man and animals have attracted attention since the earliest times, and amongst primitive and uncivilized peoples have been regarded as of supernatural origin. Aristotle himself appears to have been the first to examine them as a naturalist, and to explain that although they were outside the usual course of nature they were in the strictest sense of the word, normal individuals. Pons describes many of the well-known forms, but did not distinguish between legenordial and actual monstrosities. In the middle ages they were treated in the fullest spirit of superstition, and many relics from such a point of view still survive. The human monstrosities were regarded as having been engendered in women by the devil who had commerce with them either in his own form or in the guise of some animal. The belief still to be found amongst uneducated persons that unnatural union between women and male animals, or between men and female animals, may be fertile and produce monsters, is an attenuated form of the satanic legend. The scientific appreciation of monsters has grown with the study of embryology. William Harvey in Exercitatio de generatione animalium (1651) first referred monstrosities to their proper place as abnormalities in embryonic reproduction. The doctrine of pre-formation (see HEREDITY) obsessed biological science until 1759 when C. F. Wolf overthrew it, and Harvey's advance was not pursued, except that a number of anatomists published careful studies and descriptions of monsters or monstrous organs. Those who believed that the normal process of development was an unrolling and expansion of a pre-formed miniature of the adult had to apply a similar theory to monsters, and Sylvain Regis, a contemporary of Malpighi, and Martinet, show that monstrous germs as well as normal germs had been created at the beginning of the world. A discussion almost as memorable as that between E. G. St Hilaire and Cuvier on specific types was pursued in the French Academy from 1744 to 1745, J. B. Winslow, who supported the current pre-formationist view, having the better of the argument with Louis Lemery, who was almost alone in a rational interpretation of monstrosities. From the time of Wolf it was accepted that normal and abnormal embryos alike developed by processes of epigenetic change. Wolf himself, however, and even J. F. Meckel at the beginning of the 19th century, did not recognize the influence of physiological causes in the production of abnormalities; they believed the latter to proceed certainly in an orderly and natural way, but from abnormal ova. E. G. St Hilaire was the first to attempt experimental teratology and to lay down that many monstrosities were the result of influences causing deviations from the normal course of embryonic development. I. G. St Hilaire, the son of E. G. St Hilaire, carried the experimental method little further, but published an elaborate descriptive treatise on anomalies, Foetus in foetu, (1832-1837) which remains one of the most valuable records of the subject. A similar treatise with an incomparable atlas of illustrations was issued by W. Vrolik, the great Dutch anatomist, between 1840 and 1849, whilst A. Förster issued in 1861 a valuable textbook with a very large number of illustrations chiefly from preparations in the museum at
MONSTRANCE—MONTAGU

Würzburg. The great museums devoted much attention to the collection and display of malformations, and no account of the subject can be adequate which does not include reference to the magnificent series in the Museum of the Royal College of Surgeons of England, with the descriptive catalogues of the animal malformations written by B. T. Lowe (1893) and of the vegetable malformations by M. T. Masters (1893).

The work hitherto referred to, as well as a vast bulk of scattered contributions to teratology throughout the 19th century, was chiefly descriptive, anatomical and embryological teratology, and carried the experimental side little beyond where it had been left by the St Hilaïres. In 1891 Camille Dareste published his "Recherches sur la production artificielle des monstruosités, ou essais de tératogénie expérimentale"; his experiments, chiefly on the developing egg of the fowl, not only showed the probable cause of many of the most common abnormalities, but practically created a new branch of science, experimental embryology. Teratology has since become a side issue of the general study of the inter-relations between the inherited tendencies of the developing organism and the play of the circumambient media, and must be studied in relation to the work of H. Hertwig, W. Roux, H. Driesch, O. Bärsch, J. Loeb and their school. J. Blažed Sutton's popular "Evolution and Disease" (1890) puts in a cogent way the relation between comparative anatomy and common abnormalities, whilst W. Bateson in his "Materials for the Study of Variation" (1894) describes the acquisition of new symmetries by abnormal organisms, and discusses the possible relation between abnormalities and the origin of species.

E. Schwalbe's "Morphologie der Mischbildungen" (1906-1909) is a very complete study of the most modern developments of teratology, and contains a careful and elaborate list of authorities from the earliest times.

MONSTRANCE (through the French from Lat. monstrare, to show), a vessel used in the Roman Church for the exhibition of the Host at Benediction (q.v.) and also when carried in processions. Another name for the vessel is ostensorium, from ostendere, to exhibit, show; whence the usual French name ostensoir. The monstrance was formerly used of a reliquary, exposing the sacred object to view. The earlier monstrances for the same purpose were of silver, and were crystal cases mounted in metal frames, elaborately ornamented and jewelled. Such cases often took the form of a turret. There is a 15th-century Italian example in South Kensington Museum of a pilastered turret containing an oblong crystal case, the whole resting on a stemmed base, and surmounted with a cupola. In the 16th century the present shape was adopted, viz. a crystal or glass circular disk, more suited to the shape of the sacred wafer; this is mounted in a frame of golden rays, and the whole is supported by a stem and bases. The exhibition of the Host dates from the institution of the Festival of Corpus Christi (q.v.) by Urban IV. in 1264.

MONTBRETON, ENGUERRAND DE (c. 1400-1453), French chronicler, belonged to a noble family of Picardy. In 1436 and later he held the office of lieutenant of the gaverner (i.e. receiver of the gano, a kind of church rate) at Cambrai, and he seems to have made this city his usual place of residence. He was for some time bailiff of the cathedral chapter and then provost of Cambrai. He was married and left some children when he died on the 20th of July 1453. Little else is known about Montbret except that he was present, not at the capture of Joan of Arc, but at her subsequent interview with Philip the Good, duke of Burgundy. Continuing the work of Froissart, Montbret wrote a "Chronique," which extends to two books and covers the period between 1400 and 1444, when, according to another chronicler, Matthieu d'Escouhy, he ceased to write. But following a custom which was by no means uncommon in the middle ages, a clumsy sequel, extending to 1516, was formed out of various chronicles and tacked on to his work. Monbret's own writings, dealing with the latter part of the Hundred Years' War, are valuable because they contain a large number of documents which are certainly, and reported speeches which are probably, authentic. The author, however, shows little power of narration; his work, although clear, is dull, and is strongly tinged with the pedantry of its century, the most pedantic in French history. His somewhat ostentatious assertions of impartiality do not cloak a marked preference for the Burgundians in their struggle with France.

Among many editions of the "Chronique" may be mentioned the one edited for the Société de l'Histoire de France by M. Douët d'Arcq (Paris, 1857-1862), which, however, is not very good. See A. Molinier, "Les Sources de l'Histoire de France," tomes iv. and v. (Paris, 1904).

MONTAGNAIS (Fr. "montaineurs"), the collective French name (1) for a group of North American Indian tribes of Quebec province, (2) for four tribes of the northern division of the Athabaskan stock of North American Indians in the interior of British North America.

MONTAGU (Family). Dru of Montaigu or Montagud, the ancestor of the Montagus, earls of Salisbury, came to England with Robert, count of Mortain, half-brother of William the Conqueror. He is found in Domesday among the chief tenants of the count in Somerset, where Dru held the manor of Shepton. Upon the hill of Lutgaresse in Wurzburg, in 1327, Dru built the castle which he called Montacu—but there is no reason for supposing that the name was derived from the castle, he being probably a Normandy baron, from Montaigu or Montagu-les-bois, both in the neighbourhood of Mortain. The Domesday holding of Dru is represented in the return of 1166 by the ten knights' fee upon which his descendant, another Dru, is assessed. William Montagu of Shepton is among the knights summoned by Henry III. to the Gascon War and to the Welsh border in 1257. His son Simon, the first of the family to make a figure in history, followed Edward I. in 1277 against Llywelyn ap Gruffydd, being then, as it would appear, a minor, and he served again in 1282, when Llywelyn's power was broken for the last time. By a charter dated in 1290 his Somersetshire manors and the manor of Aston Clinton were confirmed to him by a grant from the Crown. In 1296 a ship under his command broke the blockade of Bordeaux. In 1298 he was summoned as a baron; and in 1301, as Simon lord of Montagu, he sealed the famous letter of the barons to the pope with the seal of the arms of Montagu, the counterscarl showing a griffin. One of the earliest entries in the rolls of chancery is the record of a visitation by the queen's household in 1305 of the arms seen in England was afforded when Simon's banner was displayed at the feast of the Corpus Christi at Rosslyn, and besides this griffin, gold on a blue field, with the Montagu's indented fesse of three fusils. He died in 1317 and was succeeded by his son William (d. 1319), a favourite of Edward II., whose household steward he became, and seneschal of Aquitaine and Gascony. His eldest son, another William, came of age in 1322, and in 1330 led the young king's partisans by the secret way into Nottingham Castle, and carried off the earl of March. The day before Mortimer had denounced Montagu as a traitor, but Montagu struck at once and his success was rewarded by grants from the forfeited lands of March. In 1337 he was created earl of Salisbury, and on the death of Thomas of Brotherton in 1338 he was made marshal of England. His king employed him in missions to France, Scotland, Germany and Castile, but war was, as with most of the men of his house, the chief business of his short life. At some time between 1340 and 1342 he led an expedition of his own against the Isle of Man, winning from the Scots the little kingdom to which he had inherited a claim. His grandfather Simon is said to have married a certain Auffray or "Aurica," sometimes described as "daughter of Fergan and of the domain of Orray, king of Man," and sometimes as the grand-daughter and heir of John de Courcy, the conqueror of Ulster, whose wife "Auffra" was sister of King Olaf II. John de Courcy, however, died childless, and in 1287 Simon names his wife as Hawise. The second Auffra or Auffray claimed the island as heir of Magnus II. (d. 1265), a letter of Edward I. in 1293 citing John of South Carolina to answer her appeal to King John's suzerain. By her charter of 1306 the same Auffra, styling herself "Auffra of Connought, heir of the land of Man," granted the island to Simon, and this grant, rather than the marriage universally asserted by Simon's biographers, was probably the origin of the Montagu
MONTAGU, E. R.—MONTAGU, LADY

See Elizabeth Montagu, the Queen of the Blue Stockings: Her Correspondence from 1720 to 1761, edited by E. J. Climenon (3 vols. 1906); and R. Hutchon, Mrs Montagu and her Friends, 1720–1800 (Eng. trans., 1907).

MONTAGU, LADY MARY WORLETY (1668–1762), English letter-writer, eldest daughter of Evelyn Pierrepont, afterwards duke of Kingston, was baptized at Covent Garden on the 26th of May 1680. Her mother, who died while her daughter was still a child, was a daughter of William Fielding, earl of Denbigh. Her father was proud of her beauty and wit, and when she was eight years old she is said to have been the toast of the Kit-Kat Club. He took small pains with the education of his children, but Lady Mary was encouraged in her self-imposed studies by her uncle, William Fielding, and by Bishop Burnet. She formed a close friendship with Mary Astell, who was a champion of women's rights, and with Anne Worlety Montagu, granddaughter of the first earl of Sandwich. With this lady she carried on an animated correspondence. The letters on Anne's side, however, were often copied from drafts written by her brother, Edward Worlety Montagu, and after Anne's death in 1709 the correspondence ceased. Anne's daughter Mary was prosecuted without an intermediary. Lady Mary's letter, now marquis of Dorchester, declined, however, to accept Montagu as a son-in-law because he refused to entail his estate on a possible heir. Negotiations were broken off, and when the marquess insisted on another marriage for his daughter the pair eloped (1712). The early years of Lady Mary Worlety Montagu's married life were spent in rigid economy and retirement in the country. Her husband was M.P. for Westminster in 1715, and shortly afterwards was made a commissioner of the treasury. When Lady Mary joined him in London her wit and beauty soon made her a prominent figure at court. Early in 1716 Montagu was appointed ambassador to Constantinople. Lady Mary accompanied him to Vienna, and thence to Adrianople and Constantinople. He was recalled in 1717, but they remained at Constantinople until 1718. The story of this voyage and of her observations of Eastern life is told in a series of lively letters full of graphic description. From Turkey she brought back the practice of inoculation for small-pox. She had her own children inoculated, and encountered a vast amount of prejudice in bringing the matter forward. Before starting for the East she had made the acquaintance of Alexander Pope, and during her absence he addressed to her a series of extravagant letters, which appear to have been chiefly exercises in the art of writing galling epistles. Very few letters passed after Lady Mary's return, and various reasons have been suggested for the subsequent estrangement and violent quarrel. Mr Moy Thomas suggests that the cause is to be found in the last of the Letters during the embassy to Constantinople. It is addressed to Pope and purports to be dated from Dover, the 1st of November 1718. It contains a parody on Pope's Epistle on the Lovers struck by Lightning. The MS. collection of these letters was passed round a considerable circle, and Pope may well have been offended at the circulation of this piece of satire.

Moy Thomas supposed that Lady Mary's friendship with Lady Hervey has also been alleged, but Lady Louisa Stuart says Pope had written to Lady Mary a declaration of love, which she had received with an outburst of laughter. In any case Lady Mary always professed complete innocence of all cause of offence in public. She is alluded to in the Dunciad in a passage to which Pope affixed one of his insulting notes. A Pop upon Pope was generally supposed to be from her pen, and Pope thought she was part author of One Epistle to Mr A. Pope (1730). Pope attacked her again and again, but with especial virulence in a gross couplet in the Imposture of the First Satire of the Second Book of Horace, as Sappho. She asked a third person to transmogrify, and received the obvious answer that Pope could not have foreseen that she or any one else would apply so base an insult to herself. Verses addressed to an Imitator of Horace by a Lady (1733), a scurrilous reply to these attacks, is generally attributed to the joint efforts of Lady Mary and her sworn ally, Lord Hervey. She had a romantic correspondence with a Frenchman named Rémond, who addressed her to a series of excessively gallant letters before

claim. The first earl died in 1344 and was buried in the Whitefriars Church in London. His wife, Katherine, daughter of William de Graunson, and co-heir, in her issue, of her brothers, is connected by a legend of no value with the foundation of the Order of the Garter. Between William, his son and heir, the second earl (1328–1397) and Joan of Kent, daughter of Edmund of Woodstock, there was a contract of marriage which was made null by the pope's bull in 1349. William was one of the knights-founders of the Order of the Garter, fought at Crecy, and commanded the rearward battle at Poitiers. According to Froissart he attended the young Richard in Smithfield when the king faced the mob after the death of Wat Tyler. His only son was killed in 1383 at a tournament, and in 1393 the earl sold the lordship and crown of Man to William Scorpe of Bolton. He was succeeded by his nephew John, the third earl (c. 1350–1400), son of Sir John Montagu by Margaret, the heir of the barons of Monthermer. The new earl was notorious as a Lollard, and was accused, after Henry IV's accession, of a share in Gloucester's death from which he was to have cleared himself in combat with the Lord Morley. But he joined Kent, Huntingdon and Rutland in their plot against Henry, and was beheaded with the earl, of Kent by the Cirencester mob. By his wife Maude, daughter of Sir Adam Francis, he had Thomas (1388–1428), who was summoned as an earl in 1409, his father's dignities being restored to him in 1421, by which time his services at Harlecur and Aigincourt had earned him French lordships, the lieutenant-generalship of Normandy and the earldom of Perche. The last of a race of warriors, he ended his service at the famous siege of Orleans, a cannon-ball diving into his face the stone and ironwork of the window from which he was gazing at the city. By his second wife, the daughter of Thomas Chaucer the Speaker, he had no issue. By his first wife, Eleanor, daughter of Thomas Holand, earl of Kent, he had an only daughter Alice, wife of Richard Neville, a younger son of the first earl of Westmorland, who claimed and was allowed the earldom of Salisbury in right of his marriage. The famous Richard Make-a-King, earl of Warenne, lord Salisbury, was the grandson of the last of the Montagu earls.

Sir Edward Montagu of Boughton, a chief justice of the king's bench who died in 1557, was ancestor of three lines of peers, the dukes of Montagu, the dukes of Manchester, and the earls of Sandwich. These Montagues of Boughton claimed, by a false pedigree, descent from the third earl of Salisbury. It is possible that there may have been some kinship between the two families, but none, apparently, that could justify the persistent quartering by these later Montagues of the arms of Monthermer.

MONTAGU, ELIZABETH ROBINSON (1720–1800), English leader of society, was born at York on the 2nd of October 1720. In 1742 she married Charles Montagu, cousin of Edward Worlety Montagu and son of the earl of Sandwich—a wealthy man, considerably her senior. Thanks to her, her Mayfair house became the social centre of intellectual society in London, and her breakfast parties and evening conversations gained for her from her admirers the title of "The Madame du Defand of the English capital." In other quarters the term "blue-stocking" was applied to her guests. From her husband, who died in 1775, she inherited a considerable fortune and large estates, in the management of which she showed much ability. In 1781 she built Sandleford Priory, near Newbury, and Montagu House, now 22 Portman Square, London, the latter from designs by James Stuart. With the colliers in the north she was extremely popular, and every May-day she entertained the London chimney-sweeps. She died on the 29th of August 1800. There is an admirable portrait of her by Reynolds.
ever seeing her. She invested money for him in South Sea stock at his desire, and as was expressly stated, at his own risk. Townshend, who at this period of his life needed means to extort a sum as a debt by a threat of exposing the correspondence to her husband. She seems to have been really alarmed, not at the imputation of gallantry, but lest her husband should discover the extent of her own speculations. This disposes of the second half of Pope’s line “Who starves a sister, or forswears a debt” (Epistle to the Satires, i. 113), and the first charge is quite devoid of foundation. She did in fact try to rescue her favourite sister, the countess of Mar, who was mentally deranged, from the custody of her brother-in-law, Lord Grange, who had treated his own wife with notorious cruelty, and the slander originated with him.

In 1739 she went abroad, and although she continued to write to her husband in terms of affection and respect they never met again. At Florence in 1740 she visited Horace Walpole, who cherished a great spite against her, and exaggerated her eccentricities into a revolting slovenliness (see Letters, ed. Cunningham, i. 59). She lived at Avignon, at Brescia, and at Loreto, on the Lago d’Iseo, which was disfigured by a painful skin disease, and her sufferings were so acute that she hints at the possibility of madness. She was struck with a terrible “fit of sickness” while visiting the countess Palazzo and her son, and perhaps her mental condition made restraint necessary. As Lady Mary was then in her sixty-third year, the scandalous interpretation put on the matter by Horace Walpole may safely be discarded. Her husband spent his last years in hoarding money, and at his death in 1761 is said to have been a millionaire.

His extreme parsimony is satirized in Pope’s Imitations of Horace (2nd satire of the 2nd book) in the portrait of Avidieu and his wife. Her daughter Mary, countess of Bute, whose husband was now prime minister, begged her to return to England. She came to London, and died in the year of her return, on the 21st of August 1762.

Her son, Edward Wortley Montagu (1713–1776), author and traveller, inherited something of his mother’s gift and more than her eccentricity. He twice ran away from the Charterhouse School, and the second time made his way as far as Oporto. He was then sent to travel with a tutor in the West Indies, and afterwards with a keeper to Holland. He made, however, a serious study of Arabic at Leiden (1741), and returned twenty years later to prosecute his studies. His father made him a meagre allowance, and he was heavily encumbered with debt. He was M.P. for Huntingdon in 1747, and was one of the secretaries at the conference of Aix-la-Chapelle. In 1751 he was involved in a disreputable gaming quarrel in Paris, and was imprisoned for eleven days in the Châtelet. He continued to sit in parliament, and wrote Reflections on the Rise and Fall of the Antient Republics . . . (1759). His father left him an annuity of £1000, the bulk of the property going to Lady Bute. He set out for extended travel in the East, and George Romney describes him as living in the Turkish manner at Venice. He had great gifts as a linguist, and was an excellent talker. His family thought him mad, and his mother left him to his own devices, going off on him at her death. He died at Padua on the 29th of April 1776.

Lady Mary’s “Town Eclogues” were published in a pirated edition as Poems in 1716. In her famous Letters (first published in the East) she made a copy shortly after her return to England. She gave the MS. to Benjamin Sowden, a clergyman of Rotterdam, in 1761. After Lady Mary’s death this was recovered by the earl of Bute, but meanwhile an unauthentic edition, supposed to have been printed in 1716, was published, and appeared in a second volume, probably spurious, was printed in 1757. The rest of the correspondence printed by Lord Wharncliffe in the edition of her letters is edited from originals in the Wortley collection. This edition (1827) contained “Introductory Anecdotes” by Lady Bute’s daughter, Lady Louisa Stuart. A more critical edition of the text, with the “Anecdotes,” and a “Memoir” by W. Moy Thomas, appeared in 1861. A selection of the letters arranged to give a continuous account of her life, by Mr A. R. Ropes, was published in 1892; and another by R. Brinley Johnson in “Everyman’s Library” in 1906. See also George Paston, Lady Mary Wortley Montagu and her Times (1907), which contains some hitherto unpublished letters.

Lady Mary’s journal was preserved by her daughter, Lady Bute, till shortly before her death, when she burnt it on the ground that it contained much scandal and satire, found generally on insufficient evidence, about many distinguished persons. There is a full and amusing account of Lady Wortley Montagu in Nichols’s Anecdotes of Literature, iv. 625–656.

MONTAGU, RALPH, 1st Duke of (c. 1658–1709), English diplomatist, was the second son of Edward, 2nd Baron Montagu of Boughton (1616–1684), whose peerage was one of several granted in the 17th century to different members of the Montagu family (q.v.). Sir Edward Montagu, chief justice of the king’s bench in the time of Henry VIII., was grandfather of the first earl of Manchester (see MANCHESTER, EARLS AND DUKES OF), and of Edward, 1st Baron Montagu of Boughton (1562–1644), who was imprisoned in the Tower by the parliament on account of his loyalty to Charles I. The eldest son of the latter, Edward, who succeeded him as 2nd baron, took the side of the parliament in the Civil War, and was one of the lords who conducted the king from Newark to Holmby House after his surrender by the Scots in January 1647. He had two sons, of whom Ralph was the younger. The eldest son, Edward, was master of the horse to Queen Catherine, wife of Charles II., a post from which he is said to have been disannulled by his not paying attention to the queen too ardent a nature. Catherine immediately appointed the younger brother, Ralph, to the vacant situation, and the latter soon acquired a reputation for gallantry at the court of Charles II. He took an active part in the negotiations in which Louis XIV. purchased the neutrality of England in the war between France and Holland. Having quarrelled with Danby and the duchess of Cleveland, who denounced him to the king, Montagu was elected member of parliament for Northampton in 1678, with the intention of bringing about the fall of Danby; but, having produced letters seriously compromising the minister, the dissolution of parliament placed him in such danger of arrest that he attempted to fly to France. Foiled in this design, he continued to intrigue against the government, supporting the movement for excluding the duke of York from the succession and for recognizing Monmouth as heir to the crown. His elder brother having predeceased his father, Ralph became 3rd Baron Montagu of Boughton on the death of the latter in 1684. Notwithstanding his former intrigues he gained the favour of James II. on his accession to the throne; but this did not deter him from welcoming William of Orange, who created him Viscount Monthermer and earl of Montagu in 1689. Montagu was no less avaricious than unscrupulous. In 1673 he had married the wealthy widow of the earl of Northumberland, Elizabeth Wriothesley, daughter of the earl of Southampton, who brought him a large fortune; and after her death in 1690 he married the still more wealthy Elizabeth Cavendish, daughter of the duke of Newcastle, and widow of Christopher Monk, 2nd duke of Albemarle. Montagu’s position was further strengthened in 1705 by the marriage of his son and heir to Mary, daughter of the great duke of Marlborough. In the same year he was raised to the dukedom as duke of Montagu and marquess of Monthermer. He died on the 9th of March 1709. His London residence, Montagu House, Bloomsbury, was bought by the government in 1733 to continue the nation’s collection of antiquities on its site. He built the British Museum.

The duke was succeeded by his son John, 2nd duke of Montagu (1689–1749), who in 1745 raised a cavalry regiment known as Montagu’s Carabiniers, which, however, was disbanded after Culloden. He was made a K.G. in 1719, and was a fellow of the Royal Society. As neither of his two sons survived him the title became extinct at his death in 1749, but in 1730 his daughter Mary married George Brudenell, 4th earl of Cardigan (1712–1790), who on his father-in-law’s death assumed the name and arms of Montagu, and in 1766 was created duke of Montagu. On his death, in 1790, this second dukedom of Montagu also became extinct; his only son, who was created Baron Montagu of Boughton, having predeceased him. His daughter Elizabeth married Henry, 2nd duke of Bucclieu, who thus acquired all the unencumbered property of the dukedom of Montagu, the entailled portion passing to the heirs of Cardigan.
MONTAGU, R.—MONTAIGNE

MONTAGU (or MOUNTAGUE), RICHARD (1577–1641), English divine, was born at Dorney, Buckinghamshire, and educated at Eton and Cambridge. In 1613 he was elected fellow of Eton and became rector of Stanford Rivers, Essex. He was appointed to the deanship of Hereford in 1616, but exchanged it next year for a canonry of Windsor, which he held with the rectory of Petworth, Sussex. He was also chaplain to James I. Like Laud, he disliked the extremes of Calvinism and Romanism, and this attitude constantly involved him in difficulties. About 1619 he came into collision with some Roman Catholics in his parish, and Matthew Kellison (1560?–1642) attacked him in a pamphlet entitled The Gagg of the Reformed Gospel (Douai, 1623). Montagu replied with A Gagg for the New Gospel: No. A New Gagg for an Old Goose (London, 1624). The publication of the Immediate Adresse unto God alone (London, 1624) incensed the Puritans, who appealed to the House of Commons, but Montagu was protected by the king. After the appearance of his famous Appelle Casarem (London, 1615), his case frequently arose before parliament and conferences of bishops, but his influence at court and with Laud enabled him to hold his ground. He was consecrated bishop of Chichester in 1628, and became bishop of Norwich in 1638. He died on the 13th of April 1641.

MONTAIGNE, MICHEL DE (1533–1592), French essayist, was born, as he himself tells us, between eleven o'clock and noon on the 28th of February 1533. The patronymic of the Montaigne family, who derived their title from the château at which the essayist was born and which had been bought by his grandfather, was Eyquem. It was believed to be of English origin, and the long tenure of Gascony and Guienne by the English certainly provided abundant opportunity for the introduction of English colonists. But the elaborate researches of M. Malvézin (Michel de Montaigne, son origine et sa famille, 1875) proved the existence of a family of Eyquems or Ayquems before the marriage of Eleanor of Aquitaine to Henry II. of England, though no connexion between this family, who were seigneurs de Lesparre, and the essayist's ancestors can be made out. Montaigne is not far from Bordeaux, with which the Eyquem family had for some time been connected. Pierre Eyquem, Montaigne's father, had engaged in commerce (a herring-merchant Scaliger calls him, and his grandfather Ramon had certainly followed that trade), had filled many municipal offices in Bordeaux, and had served under Francis I. in Italy as a soldier. He married Antoinette de Louppe (Lopez), descended from a family of Spanish Jews. The essayist was the third son. By the death of his elder brothers, however, he became head of the family. He had also six younger brothers and sisters. His father appears, like many other men of the time, to have made a hobby of education. Montaigne was not only put out to nurse with a peasant woman, but had his sponsors from the same class, and was accustomed to associate with it. He was taught Latin orally by servants (a German tutor, Horstuanus, is especially mentioned), who could speak no French, and many curious fancies were tried on him, as, for instance, that of waking him every morning by soft music. But he was by no means allowed to be idle. A plan of teaching him Greek by some kind of mechanical arrangement is not very intelligible, and was quite unsuccessful. These details of his education (which, like most else that is known about him, come from his own mouth) are not only interesting in themselves, but remind the reader how, not far from the same time, Rabelais, the other leading writer of French during the Renaissance, was exercising himself, though not being exercised, in plans of education almost as fantastic. At six years old Montaigne was sent to the college de Guinée at Bordeaux, then at the height of its reputation. Among its masters were Buchanan, afterwards the teacher of James I., and Muretus, one of the first scholars of the age. At thirteen Montaigne left the college de Guinée and began to study law, it is not known where, but probably at Toulouse. In 1548 he was at Bordeaux during one of the frequent riots caused by the gabelle, or salt-tax. Six years afterwards, having attained his majority, he was made a counsellor in the Bordeaux parlement. In 1558 he was present at the siege of Thionville, in 1559 and 1561 at Paris, and in 1562 at the siege of Rouen. He was also much about the court, and he admits very frankly that in his youth he led a life of pleasure, if not exactly of excess. In 1565 he married Françoise de la Chassaigne, whose father was, like himself, a member of the Bordeaux parliament. Three years later his father died, and he succeeded to the family possessions. Finally, in 1571, as he tells us in an inscription still extant, he retired to Montaigne to take up his abode there, having given up his magistracy the year before. His health, never strong, had been further weakened by the hard living which was usual at the time. He resolved, accordingly, to retire to a life of study and contemplation, though he indulged in no asceticism except careful diet. He neither had nor professed any enthusiastic affection for his wife, but he lived on excellent terms with her, and bestowed some pains on the education of the only child (a daughter, Léonore) who survived infancy. In his study—a tower of refuge, separate from the house, which he had minutely described—he sat at his desk, wrote dictations of his experiences which still remain on the walls and rafters, annotated his books, some of which are still in existence, and in other ways gave himself up to a learned ease.

He was not new to literature. In his father's lifetime, and at his request, he had translated the Theologia naturalis of Raymond de Sabunde, a Spanish schoolman (published 1566). On first coming to live at Montaigne he edited the works of his deceased friend Étienne de la Boétie, who had been the comrade of his youth, who died early, and who, with poems of real promise, had composed a declamatory and school-boyish thing on republicanism, entitled le Contr' un, which is one of the most over-estimated books in literature. But the years of his studious retirement were spent on a work of infinitely greater importance. Garrulous after a fashion as Montaigne is, he gives us no clear idea of any original or definite impulse leading him to write the famous Essais. It is very probable that if they were at first intended to have any special form at all it was that of a table-book or journal, such as was never more commonly kept than in the 16th century. It is certainly very noticeable that the earlier essays, those of the first two books, differ from the later in one most striking point, in that of length. Speaking generally, the essays of the third book average fully four times the length of those of the other two. This of itself would suggest a difference in the system of composition. These first two books appeared in 1580, when their author was forty-seven years old.

They contain, as at present published, no fewer than ninety-three essays, besides an exceedingly long apology for the already mentioned Raymund Sabunde, in itself somewhat the nucleus of Montaigne's philosophy. The book begins with a short avis (address to the reader), opening with the well-known words: "C'est ici un livre de bon foy, lecteur," and sketching in a few lively sentences the two minds in which his work was kept up throughout. His sole object, the author says, is to leave for his friends and relations a mental portrait of himself, defects and all; he cares neither for utility nor for fame. The essays then begin, without any attempt at classification, or classification in fragments. Their titles are the most diverse character. Sometimes they are proverbial sayings or moral adages, such as "Par divers moyens on arrive a pareille fin," "Qu'il ne faut juger de notre deur qu'apres la mort," "Le profit de l'argent est le moingno de l'art, mais qui perd de l'argent va une place sans raison," "De la bataille de Dreux," &c. Occasionally the titles seem to be deliberately fantastic, as "Des puces," "De l'usage de se vestir." Sometimes, though not very often, the section titles appear to be a kind of introduction, headed like the chapters of a treatise on ethics: "De la tristesse," "De l'oisiveté," "De la peur," "De l'amitié." Sometimes a fact or some sort which has awakened a train of associations in the mind of the essayist is adopted as a title, as "De la table," "De la place sans raison." "De la bataille de Dreux," &c. Occasionally the titles seem to be deliberately fantastic, as "Des puces," "De l'usage de se vestir." Sometimes, though not very often, the section titles appear to be a kind of introduction, headed like the chapters of a treatise on ethics: "De la tristesse," "De l'oisiveté," "De la peur," "De l'amitié." Sometimes a fact or some sort which has awakened a train of associations in the mind of the essayist is adopted as a title, as "De la table," "De la place sans raison."
rarely more than a starting-point; and, though the brevity of these first essays for the most part prevents the author from journeying very far, he contrives to get to the utmost range of his tether. Quotations are very frequent.

In 1571 he had received the order of Saint-Michel; in 1574 was with the army of the duke de Montpensier; two years later was made gentleman-in-ordinary to Henry III., and next year again to Henry of Navarre. He distanced Paris occasionally and travelled for health or pleasure to Cauteers, Eaux Chaudes and elsewhere. But his health grew worse and worse, and he was tormented by stone and gravel. He accordingly resolved to journey to the baths of Lucca. Late in the 18th century a journal was found in the château of Montaigne giving an account of this journey, and it was published in 1774; part of it is written in Italian and part dictated in French, the latter being for the most part the work of a secretary or servant. Whatever may be the biographical value of this work, which has rarely been reprinted with the Essays themselves, and the MS. of which disappeared early, it is almost entirely destitute of literary interest. The course of the journey was first northwards to Plombières, then by Basel to Augsburg and Munich, then through Tirol to Verona and Padua in Italy. Montaigne visited most of the famous cities of the north and centre, staying five months at Rome, where he had an audience of the pope and was made a Roman citizen, and finally establishing himself at the baths of Lucca for nearly as long a time. There he received news of his election as mayor of Bordeaux, a pecuniary royal endowment, and was discharged from the liabilities of his former profession. After some time journeyed homewards. The tour contains much minute information about roads, food, travelling, &c., but the singular condition in which it exists and the disappearance of the MS. make it rather difficult to use it as a document. The best argument in its favour is the improbability of anyone having taken the trouble to forge so bald and awkward a heap of details. Of the fact of the journey there is no doubt whatever.

Montaigne was not altogether delighted at his election to the mayoralty, which promised him two years of responsibility if not very hard work. The memory of his father, however, and the commands of the king induced him to accept it; and he seems to have discharged it neither better nor worse than an average magistrate. Indeed, he gave sufficient satisfaction to the citizens to be re-elected at the close of his term, and it may be suspected that the honour of the position, which was really one of considerable dignity and importance, was not altogether indifferent to him. Unfortunately, it cannot be said that "nothing in his office became him like a Yarmouth coat," and in less than a year of his perpetual royal appointment he was discharged by the election of his successor, the maréchal de Matignon; but there was a severe pestilence in Bordeaux, and Montaigne writes to the jurors of that town, in one of the few undoubtedly authentic letters which we possess, to the effect that he will leave them to judge whether his presence at the election is so necessary as to make it worth his while to expose himself to the danger of going into the town in its then condition, "which is specially dangerous for men coming from a good air, as he does." It may be urged in his favour that the general circumstances of the time, where they did not produce reckless and foolhardy daring, almost necessarily produced a somewhat excessive caution. However this may be, Montaigne had difficulty enough during this turbulent period, all the more so from his neighbourhood to the chief haunts and possessions of Henry of Navarre, who actually visited him at Montaigne in 1584. He was able, despite the occupations of his journey, his mayorality, and the pressure of civil war and pestilence, which was not confined to the town, to continue his essay-writing. His second term of office terminated in 1585; and in 1588 after a visit of some length to Paris, the third book of the Essays was published, together with the former ones considerably revised. The new essays, as has been remarked, differ strikingly from the older ones in respect of length; and the whimsical unexpectedness of the titles reappears in but two of them: "De Coches" and "De Boiteux." They are, however, identical with the earlier ones in spirit, and make with them a harmonious whole—a book which has hardly been second in influence to any of the modern world.

The influence of his Essays is almost equally remarkable in point of matter and in point of form. The latter aspect may be taken first. Montaigne is one of the few great writers who have not only perfected but have also invented a literary kind. The essay as he gave it no longer served as an interlude between the literary and the matter of classical times. It has been suggested that the form which the essays assumed was in a way accidental, and this of itself precludes the idea of a definite model, even if such a model could be found. Beginning with the throwing together of a few stray thoughts or statements, often by him, in his minute acumen, the essay in time acquires more and more certainty of hand, until he produces such masterpieces of apparent desultoriness and real unity as the essay "Sur des vers de Virgile." In matter of style and language Montaigne is one of the greatest of all time, which probably helps to make him to it are more clearly traceable. His favourite author was beyond all doubt Plutarch, and his own explicit confession makes it undeniable that Plutarch's translator, Jacques Amyot, was his master in point of vocabulary and as far as he took any lessons in it of style. Montaigne, however, followed with the perfect independence that characterized him. He was a contemporary of Ronsard, and his first essays were published when the innovations of the Pléiade had fully established themselves. He adopted them to a great extent, but with much discrimination, and he used his own judgment in latinitizing when he pleased. In the same way he retained archaic and provincial words with a good deal of freedom, but by no means to excess. In the arrangement, as in the selection, of his language he is equally original. He has not the excessive classicalism which makes even the fine prose of Jean Calvin, and which makes that of some of Calvin's followers intolerably stiff. As a rule he is careless of definitely rhythmical cadence, though his sentences are always pleasant. To this characteristic of his prose style is its remarkable ease and flexibility. A few years after Montaigne's death a great revolution, as is generally known, passed over France. The criticism of Malherbe, followed by the establishment of the Académie Française and its independent censorship, brought Favre Vaugelas, and the severe literary censorship of Boileau, turned French in less than three-quarters of a century from one of the finest languages in Europe to one of the most restricted. During this last campaign of moral, as well as of language, the two were Rabelais and Montaigne—Montaigne being of his nature more generally readable than Rabelais. All the great prose writers of France could not fail to be influenced by the racy phrase, the plain and picturesque vocabulary, and the unconstrained constructions of Montaigne.

It would be impossible, however, for the stoutest defender of the importance of form in literature to assign the chief part in Montaigne's influence to style. It is the method, or rather the manner of that which is only incidentally his style, which has most nearly exercised influence on the world. Like all the greatest writers except Shakespeare, Montaigne thoroughly and completely exhibits the intellectual and moral complexity of his own time. When he reacts, when he meditates, he does not do so tamely, like a water nymph who marries a lover and lets the turn of the tide be his wedding day, but with the wind of the times when he began to meditate his essays in the retirement of his country house it was tolerably certain that no golden age was about to return. As the earlier Renaissance had specially occupied itself with the practical business and pleasures of life, so the later Renaissance specially mused on the vanity of this business and these pleasures. The predisposing circumstances which affected Montaigne were thus likely to incline him to scepticism, to ethical musings on the vanity of life and the like. But to all this there had to be added the peculiarity of the man himself, the temperamental constitution, and the neglect of it has led some readers to adopt a more positive idea of Montaigne's scepticism than is fully justified by all the facts. The attitude which he assumed was no doubt ephletic and critical throughout, and he might have preserved it better if he had been less given to meditating in this attitude; and yet this latter aspect of his character, this manifestation of his disposition, might have made him a more complete and perfect sceptic than he was. The alterations show a progressively freethinking attitude, side by side with a growing tendency to conceal it by ambiguity and innuendo. But until all the documents are accessible this must remain doubtful. TheApparently the tale of death. The reason of the misapprehension which is current is due very mainly to the fact that he was eminently a
humorist. Perhaps the only actual parallel to Montaigne in literature is Lamb. There are differences between them, arising naturally enough from their differences of temperament and education, and the two agree in their attitude—an attitude which is sceptical without being negative and humorous without being satiric. There is hardly any writer in whom the human comedy is treated with such completeness as it is by Montaigne. There is discernible in his Essays the attempt to map out a complete plan, and then to fill up its outlines. But in the desultory and haphazard fashion in which he disposes of his material, and the relative insufficiency of the passages which he picks up, a certain distinctness of temper, which is as much a feature of the Frenchman as of the Englishman, is discernible in his Essays. The exceptions are chiefly to be found in the higher and more poetical strain of feeling to which the humorous temperament lends itself with reluctance and distrust, though by no means excludes them.

The positiveness of the Frenchman is already noticeable in Rabelais, though not so much as in Montaigne. His Republicanism were noticeable still in Montaigne. He is always charming, but he is rather inspiring, except in a very few passages where the sense of vanity and nothingness possesses him with unusual strength. As a general rule, a man of the 19th century who loses that good taste sufficiently to be called burlesque occupies him. There is a kind of anticipation of the scientific spirit in the careful zeal with which he picks up odd aspects of mankind and comments upon them as he places them in his museum. Such a temperament is most pleasingly shown when it is least personal. A dozen generations of men have rejoiced in the gentle irony with which Montaigne handles the ludicrum humanum saeculi, in the quaint felicity of his selection of examples, and in the real though sometimes fantastic wisdom of his comment on his selections.

Montaigne did not very long survive the completion of his book. On his way to Paris for the purpose of getting it printed he stayed for some time at Blois, where he met De Thou. In Paris itself he was for a short time committed to the Bastille by the League, as a kind of hostage, it is said, for a member of their party who had been arrested at Rouen by Henry of Navarre. But he was in no real danger. He was well known to and was well known by both Catherine de’ Medici and the Guises, and was very soon released. In Paris, too, at this time he made a whimsical but pleasant friendship. Marie de Jars de Goury (1565-1645), one of the most learned ladies of that century, had conceived such admiration for the author of the Essays that, though a very young girl and connected with many noble families, she travelled to the capital on purpose to make his acquaintance. He gave her the title of his ‘fille d’alliance’ (adopted daughter), which she bore proudly for the rest of her long life. She lived far into the 17th century, and became a character and something of a laughing-stock to the new generation; but her services to Montaigne’s literary memory were, as will be seen, great. Of his other friends in these last years of his life the most important were Etienne Pasquier and Pierre Charron. The latter, indeed, was more than a friend; he was a disciple; and Montaigne, just as he had constituted Mlle de Gourny his ‘fille d’alliance,’ bestowed on Charron the rather curious compliment of desiring that he should take the arms of the family of Montaigne. It has been thought from these two facts, and from an expression in one of the later essays, that the marriage of his daughter Léonore to Gaston de La Tour had not turned out to his satisfaction. But there is no evidence of a love affection, except towards his father, was by no means Montaigne’s strongest point. When Henry was killed in the battle of Parnemont, Montaigne, whom he had again visited in 1588, went to court to recover, but the essayist refused. It would seem that he returned from Paris to his old life of study and meditation and working up his Essays. No new ones were found after his death, but many alterations and insertions. His various maladies grew worse; yet they were not the direct cause of his death. He was attacked with quinsy, which rapidly brought about paralysis of the tongue, and he died on the 13th of September 1592, in circumstances which, as Pasquier reports them, completely dispove any intention of displaying anti-Christian or anti-Catholic leanings. He was buried, though not till some months after his death, in a church in Bordeaux, which after some vicissitudes became the chapel of the collège. During the Revolution the tomb, and as it was supposed the coffin, were transferred with much pomp to the town museum; but it was discovered that the wrong coffin had been taken, and it was afterwards restored to its old position. Montaigne’s widow survived him, and his daughter left posterny which became merged in the noble houses of Ségur and Lur-Saluces. But it does not appear that any male representative of the family survived.

When Mme de Gournay heard of the death of Montaigne she set out with her visit a visit of ceremony and condolence to the widow, which had important results for literature. Mme de Montaigne gave her a copy of the edition of 1588 annotated copiously; at the same time, apparently, she bestowed another copy, which was annotated and corrected by Mme de Thau, and in 1589 they went to Bordeaux, to which the church in which his remains lay was attached. Mlle de Gournay thereupon set to work to produce a new and final edition with a zeal and energy which would have done credit to the author himself. The edition thus produced in 1595 has with justice passed as the standard, even in preference to those which appeared during the author’s lifetime. Unfortunately Mme de Gournay’s original does not appear to exist and no text was until the appearance of Mme Courbet and Royer’s edition, to have been somewhat wantonly corrupted, especially in the important point of spelling. The Feuilléns copy is in existence, being the only manuscript, or partly manuscript, authority for the text; but access to it and the action of its editors are subject to the arbitrary dictation of the authorities, and until it is completely edited students are rather at the mercy of those who have actually consulted it. It was edited in 1805 by Nauigeon, the disciple of Diderot, but, according to later inquiries, completed in 1822 by Duperac. In 1826-1828 the famous edition of 1588, with the various readings of two others which appeared during the author’s lifetime, was reprinted by MM. Dezeimeir and Burckhause in 1870. That of Le Clerc (3 vols., Paris, 1826-1828) and in a more complete form, that of a C. Frenay (vols., Paris, 1860), was the most useful; but that of MM. Courbet and Royer (1872-1900) is at present the standard. The Journal, long neglected and stille (vide supra) doubting, was re-edited by Professor A. d’Anconia (Città di Castello, 1890, 2 vols.) and by Stapfer’s de Montaigne (3 vols., Paris, 1889). The editions of Montaigne in France and elsewhere, and the works upon him during the past three centuries, are innumerable. The most recent books of importance are P. Bonnefon’s Montaigne, l’homme et l’œuvre (Paris, 1904), and G. Gournay’s Le Grand et les petits Dialogues de Montaigne, the latter a book of remarkable excellence. Edmén Champion’s Introduction aux essais may also be noticed, and Professor Dowden’s Montaigne (1905), which has an excellent bibliography. The most important edition of Montaigne in English, by G. Santi-bury, is noteworthy for its attention to the life and character. In England Montaigne was early popular. It was long that the autograph of Shakespeare in a copy of Florio’s translation showed his study of the Essays. The autograph has been repeated, and it is believed that the impression of a tempest who painted a complete translation, which, though not extraordinarily faithful, possesses a good deal of rough vigour. It has been frequently reprinted with alterations and additions. Reprints of Florio are also numerous. One in the "Tudor Translations" (1863) has an introduction by G. Santsbury. An English biography of Montaigne by Bayle and St John appeared in 1858, and Walter Pater’s unfinished Gaston de Lagard is borrowed from Montaigne and his son. The most noteworthy critical handling of the subject in English is unquestionably Emerson’s in Representative Men. (G. S. A.)

MONTALBÁN. JUAN PEREZ DE (1602-1638), Spanish dramatist, poet and novelist, was born at Madrid in 1602. At the age of eighteen he became a licentiate in theology, was ordained priest in 1625 and appointed notary to the Inquisition. In 1619 he began writing for the stage under the guidance of Lope de Vega, who is said to have assisted him in composing El Orfeo en lengua castellana (1624), a poem obviously intended to compete with Júarez’s Orfeo, published earlier in the same year. The prose tales in Sucesos y prodigios de amor (1624) and Para todos (1632) were very popular. Montalbán’s father, a publisher at Madrid, issued a pirated edition of Quevedo’s Buscón, which roused an angry controversy. The violence of these polemics, the strain of overwork, and the death of Lope de Vega so affected Montalbán that he became insane; he died at Madrid on the 25th of June 1638. His last work was a eulogistic biography of Lope de Vega in the Fama postuma (1636). His plays, published in 1635-1638, are all in the manner of that great dramatist, and were represented with much success, but, with the exception of Los Amantes de Teruel, are little
more than clever improvisations. A libellous attack on Quevedo, entitled El Tribunal de la justa venganza (1835), is often ascribed to him.

**MONTALEMBERT, CHARLES FORBES RENÉ DE (1810-1870)**, French publicist and historian, was born on the 15th of March 1810. The family was a very ancient one, belonging to Poitou, or rather to Angoumois. Direct descent is said to be traced back to the 15th century, and charters carry the history of the house two centuries further. For some generations before the historian the family had been distinguished, not merely in the army, but for scientific attainments. Montalembert’s father, Marc René, emigrated, fought under Condé, and subsequently served in the English army; he married Élise Rosée Forbes, and his eldest son, Charles, was born in London. At the Restoration of 1814 Marc René returned to France, was raised to the peerage in 1816, and became ambassador to Sweden (where Charles completed his education) in 1826. He died in 1831, a year after the overthrow of the legitimate monarchy. Charles de Montalembert was too young to take his seat as a peer (twenty-five being the necessary age), but he retained other rights, and this, combined with his literary and intellectual activity, made him a person of some importance. He was a Liberal, in the English sense, and had he not resolutely separated himself from the old régime from the religious question he would have been one of the policy of the golden mean represented by Louis Philippe. He wished to see the Church free from the control of the state, and passionately attacked the monopoly of public instruction by which the monarchy fortified its position. This latter scheme first brought Montalembert into notice, as he was formally charged with unlicensed teaching. He claimed the right of trial by his peers, and made a notable defence, of course with a deliberate intention of protest (1832). On the other hand, he thought that the Church should not obstinately oppose new ideas. He had eagerly entered into the plans of his friends, Lamennais and Lacordaire, and collaborated with them in the newspaper l’Avenir. The Ultramontane party was roused by their boldness, and Montalembert and his two friends then left for Rome. This famous pilgrimage proved useless to mitigate the measures which the Roman curia took against l’Avenir. Its doctrines were condemned in two encyclicals (Mirari vos, 1832, and Singulier obis, 1834), and Montalembert submitted. He still clung to his early Liberalism, and in 1848 saw without regret the end of a government towards which he had always been hostile. He had served in the Chamber as a deputy from 1837, but to his great regret was then obliged to retire into private life. He was still, however, recognized as one of the most formidable opponents of the empire. Meanwhile his Liberal ideas had made him some irremovable enemies among the Ultramontanes. Louis Veuillot, in his paper, L’Univer, fought desperately against him. Montalembert answered by reviving a review which had for some time ceased publication, the Correspondant (1855), in which he set himself to fight both against the fanatical party of Pius IX. and the Syllabus, and the more or less free-thinking Liberals of the Revue des deux mondes. He took great interest in the debates of the Liberal empire, whilst trying to parry the blow which the Ultramontanes were preparing to deal to Liberal ideas by proclaiming in the Vatican council the dogma of papal infallibility. But once again he would not allow himself to be seduced from obedience to the pope; he now severed his connexion with Père Hyacinthe (Loison) as he had with Lamennais, and made the submission expected of him to the council. It was his last fall. Broken down by the trial of these continued fights against people of his own religion, he died prematurely on the 13th of March 1870.

In addition to being an eloquent orator, Montalembert wrote a style at once picturesque, fiery and polished. He was an ardent student of the middle ages, but his medieval enthusiasm was strongly tainted with religious sentiments. His first historical work, La vie de Ste Elisabeth de Hononge (1836), is not so much a history as a religious manifesto, which did much to restore the position of hagiography. It met with great success; but Montalembert was not elected a member of the Académie Française till later, after the fall of the July monarchy (Jan. 9, 1851). From this time he gave much of his attention to a great work on monachism in the West. He was at first attracted by the figure of St Bernard, and devoted one volume to him; this was, however, afterwards withdrawn on the advice of his friend Dupanloup, and the whole edition was destroyed. He then enlarged his original plan and published the first volumes of his Moines d’occident (1860), an eloquent work which was received with much admiration in those circles where language was more appreciated than learning. The work, which was unfinished at the time of the author’s death, was completed later from some long fragments found among his papers (vols. vi. and vii., 1877).

Montalembert married Mlle de Mérōde, sister of one of Pius IX.’s ministers. His daughter married the vicomte de Meaux, a Roman Catholic statesman and distinguished writer.

**BIBLIOGRAPHY.—Mrs Oliphant, Memoir of Count de Montalembert, peer of France, deputy for the department of Doubs (Edinburgh, 1872).** Oliphant, who has also translated into English Moines d’occident, has given a most charming account of the youth of Montalembert, and especially the first years passed at Stannore. See also the Vicomte de Meaux, Montalembert (1897); see also L. P. Lecanuet, Montalembert, d’après son journal et sa correspondance (3 vols. 1895-1902) a work filled with important documents; and Léon Lefèbure, Portraits de croyants au XIXe siècle: Montalembert, Auguste Cochin, François Rio (who was Montalembert’s professor of philosophy); J. P. Arnauld, Histoire du vicomte de Meaux et du vicomte de Montalembert à Louis-Philippe (Alphonse d’Apres d’Herbelot à Charles de Montalembert et à Léon Cornard (1828-1830).

**MONTALEMBERT, MARQUIS DE (1774-1800)**, French military engineer and writer, was born at Angoulême on the 16th of July 1774, and entered the French Army in 1792. He fought in the War of the Polish Succession on the Rhine (1733-34), and in the War of the Austrian Succession made the campaigns of 1745 in Bohemia and Italy. In the years preceding the Seven Years’ War, Montalembert (who had become an associate member of the Académie des Sciences in 1747) devoted his energies to the art of fortification, to which Vauban’s Traité de l’artillerie attracted him, and founded the arsenal at Ruelle, near his birthplace. On the outbreak of war he became French commissioner with the allied army of Sweden, with the rank of brigadier-general. He constructed the field fortifications of Anklam and Stralsund. In 1751 he was promoted maréchal de camp, and began the works on which his fame rests. Montalembert’s fortresses has been aptly described by an English author as an “immense battery.” The intricacies of trace by Cormontaigne sought to minimize the power of the attack, are described with favour in AHECUTON (1905); and so arranged that the defenders can bring an overwhelming fire to bear on the works of the besieger. Montalembert, who himself drew his idea from the practice of Swedish and Prussian engineers, furnished the German constructors of the early 19th century with the means of designing entrenched camps suitable to modern conditions of warfare. The “polygonal” method of fortification is the direct outcome of Montalembert’s systems. In his own country the caste-spirit of the engineer corps was roused to defend Vauban, and though Montalembert was allowed to construct some successful works at Aix and Oleron, he was forbidden to publish his method, and given but little opportunity for actual building. After fifteen years of secrecy he published in Paris (1776-1778) the first edition of La Fortification perpendiculaire. At the time of the Revolution he surrendered a pension, which had been granted him for the loss of an eye, although he was deeply in debt, particularly on account of his Ruelle foundry, on which 6000 livres were due to him from the state, which he never received. Persuaded by his wife, he joined in the emigration of the noblesse, and for a time lived in England. All his possessions were thereupon sequestered by the republican government. He very soon returned, divorced his wife, and married again. He obtained the annulment of the sequestration. Canton often called him into consultation on military affairs, and, in 1792, promoted him general of division. Proposed as a member of the Institut in 1797, he withdrew his candidature in favour of General Bonaparte. He died at Paris on the 29th of March 1800. His wife, Marie Josephine de Comarieu, was the
hostess of one of the best-known salons of Louis XVI's time. She wrote two novels of merit, Elise Dumasnil (1798) and Horace (1822). She died in 1832.

Besides his masterpiece, he wrote L'Art défensif supérieur à l'offensive (1793) in reply to attacks made upon his earliest work, La Fortification perpendiculaire, of which in later editions it forms part; Mémoire historique sur le font de canons (Paris, 1798), and other works on the same subject: Correspondance pendant la guerre de 1757-1760 (London, 1777); Rotation des boulets (Acad., 1755); and Réductions du siège de S. Jean d'Acre (Paris, 1759). He also wrote short stories and verse, as well as comedies. He also modelled a complete system of Fortification (92 models), which he offered to the Committee of Public Safety. His bust was sculptured by Bonvallet. Montalambert's position in the history of fortification may be summed up as a realization of his own wish to do for the defence what Vauban had done for the attack. It was the inability of his contemporaries to see that Vauban's strength lay in his parapets and batteries and not in his bastions that vitiated their methods, and it was Montalambert's appreciation of this fact which made him the father of modern fortification. See Tripié, La fortification dédiée de son histoire (Paris, 1866).

MONTALIVET, MARTHE-CAMILLE BACHASSON, COMTE DE (1801–1880), French statesman, was born at Valence on the 25th of April 1801, the second son of Jean Pierre Bachasson, comte de Montalivet (1766–1843), who had been a peer of France in the Order of the Holy Spirit, born the 12th of January 1756, had been a peer of France in the Order of the Holy Spirit, born the 12th of January 1756, and had died at Paris in 1833. He was born in 1797. Joseph (1799–1823) had been engineer officer, and he was educated at the École Polytechnique and the École des Ponts et Chaussées. Under Louis Philippe he occupied the ministry of the interior from, with short intervals, 1830 to 1840. After 1840 he was intendant of the civil list, occupying himself with the museums of Versailles and the Louvre, and the restoration of the palaces of Fontainebleau and Saint-Cloud. In 1847 he tried to induce Louis Philippe to adopt electoral reform, and after the catastrophe of the next year undertook the defence of the July monarchy in two works, Le Roi Louis Philippe et la liste civile (1851) and Rien Dix années de gouvernement parlementaire (1852). He had become a member of the Academy of Fine Arts in 1840 and in 1843 grand cross of the Legion of Honour. The attitude of the comte de Chambord after 1870 led him to accept the republic, and he entered the Senate a year before his death, on the 4th of January 1880.

MONTANA, a north-western state of the United States, situated between latitudes 44° 46' and 49° N., and between longitudes 109° 39' and 113° 9' W., stretching from the southern border of Arizona N. by the Canadian provinces of British Columbia, Alberta and Assiniboia, E. by North Dakota and South Dakota; S. by Wyoming and Idaho; W. by Idaho. Montana has an area of 146,752 sq. m., 766 sq. m. of which are water surface. (For map, see IDAHO.) Physical Features.—The Rocky Mountains cross the state from north-west to south-east, and with their spurs and outlying ranges occupy nearly one-third of its area in the west and south-west; the remaining portion is occupied chiefly by the Great Plains. The main range of the Rockies follows the boundary line between Montana and Idaho west and north-west from Yellowstone Park in Wyoming to Ravalli county, then turns east-north-east to Lewis and Clark county, and from there extends north-north-west into Canada. From where the main range turns east from the Idaho boundary line the crest of the Bitter Root Mountains continues on that line with a downward slope to within one degree of latitude from the Canadian border. This range of mountains, which was formed by a great fault, has a maximum elevation at its southern end of about 9000 ft. above the sea. On the east of the Bitter Root Basin, glaciers have cut canyons between high and often precipitous walls, and between these canyons are steep and rocky ridges having peaked or saw-toothed crest lines. To the east and north-east of the Bitter Root Mountains is a considerable basin or penplain dissected by short ranges having a north-west and south-west trend. To the south-east of this basin are the great mountain masses of the state; lofty and rugged ranges radiate in all directions, and in many instances rise to heights of 10,000–11,000 ft., the highest peak in the state being Granite Peak (12,834 ft.) in Carbon county. Deep and narrow canyons are common, and, at higher levels, glaciers, carved out amphitheatres, or "circles" and "U"-shaped troughs. In the eastern part of the state the Lewis and Clark mountains consist generally of New Castile ridges, the Lewis and Clark Range to the east, and the Livingston Range to the west, which were formed by a great overthrust; between them is the Waterton-McDonald valley, 8–15 m. wide. The east slope of the Lewis and Clark range is marked by long high spurs, and the valleys between them end in radiating canyons that are crowned with bold cliffs. On the higher summits the range rises to 5000–10,400 ft. above the sea, but in the wind-gaps only to 5500–6500 ft. The Livingston range is less rugged and more massive. Like the Lewis and Clark range, its crest is broken by numerous U-shaped wind gaps and its west slope is cut by glacial troughs containing long narrow lake basins. Extending far to the eastward, especially in the south of the state, are isolated mountain groups. Among these are the Bear Paw Mountains, in the north central part, which occupy a tract 40 m. long and 20 m. wide that on the western side rises abruptly from the plains and reaches an elevation in Bear Paw Peak of 7040 ft. above the sea. The Great Plains in Montana slope from about 4000 ft. (above the sea), at the foothills of the mountains, to 2000 ft. in the north-east of the state. The Black Hills in the Black Hills state, which are common along their borders, and buttes elsewhere on the plains. The main range of the Rocky Mountains separates that part which is drained west into the Columbia river and the Pacific Ocean from that which is drained east into the Missouri and Mississippi rivers and the Gulf of Mexico, and from a very small part which is drained north-east into Hudson Bay; the water-parting which in Montana separates the drainage into the Gulf of Mexico crosses only the north-west of Teton county. The principal rivers east of the Rockies are the Missouri and three of its tributaries; the Yellowstone in the south-east, the Musselshell in the middle, and the Milk in the north. The Missouri is formed by a union of the Jefferson, the Madison and the Gallatin. It flows first east-north-east and then nearly east until it passes into North Dakota. Its channel is generally erratic and constantly shifting; its bed is sandy and its water muddy. In contrast, the Yellowstone is a stream of bright clear water running over a gravely bed and among numerous forest-clad islands. The Missouri has its source in the US, the upper basin being in Teton county, but farther upstream near Great Falls, Cascade county, to which it is navigable at high water, it falls 512 ft. in 10 m. The Yellowstone is navigable for about 300 m. The principal rivers west of the Main Divide of the Rockies are the Clark Fork of the Columbia and its principal tributary, the Flathead, which rises in British Columbia. Montana has a few mineral springs, the best known being the Lissner Springs at Helena. Small lakes and waterfalls, the result of glacial action, are numerous in the mountains. There is, however, only one large lake in the state—Flathead (or Selish) Lake, which may be regarded as an enlargement of Flathead river; it is 27 m. long, has an average width of 12 m., and a depth of more than 1000 ft.

Geology.—In the Great Plains region the geological structure is very simple, consisting of nearly horizontal strata of Cretaceous rock in the middle and western portions, and of Tertiary rock on the eastern border. But the strata have been folded and faulted until the structure is intricate and obscure. Some of the deeper canyons show rocks of nearly all ages. The higher elevations are mostly either Archean or Paleozoic formations projecting above Tertiary deposits. In the Bitter Root Valley there is a large deposit of Quaternary. Fossil remains of mammals, fish and reptiles found in the Tertiary deposits of south-western Montana are preserved in the Carnegie Museum at Pittsburgh, Pennsylvania, and in the University of Montana. They include the mandible of a mastodon and a portion of a vertebra of a large fish, both found in the Lower Madison Valley; the skull and other parts of a dog (Mesodon drammontanus), found near Drummond, Granite county; a skull of a Paraceratherium paldiscide, found near Chicago, Granite county; a portion of the skull of a Mesoscyphus latidens, found near the confluence of the three forks which form the Missouri river; and a portion of the skull of a Hyracopus prisus, found near Loma, Beaverhead county. In the region east of the Crazy Mountains, in Sweetgrass county, are marine beds of Upper Cretaceous or lower Tertiary formation containing fossils of Dinosaurs and
MONTANA

Mosasaurs, and in the museum of the university of Montana is the greatest part of the skeleton of a Dinosaur which was found here. Interesting fossil remains have also been found in Carboniferous formations in the south-west of the state.

Farming. - The nature of the soil is not strongly distinguished from that of the surrounding states. The bison, which once ranged the plains in large herds, have been exterminated; the moose and the elk are found only occasionally in the wilder regions; mountain sheep, antelope, and occasionally buffalo (within 15 yrs.) are also becoming rare. Black-tailed and mule deer are still favourite game for sportsmen. Geese, ducks and grouse are numerous on the lakes and rivers. Several kinds of fish, among which are trout, salmon, grayling and white fish, inhabit many of the lakes, rivers and streams. The conditions of the climate are such as to make Bozeman, Gallatin county, restocks waters in which the supply has been diminished.

Flora. - The Great Plains are covered for the most part only with brush and low sage bush, leaving the ground variable between and except in May and June presents a yellow and withered appearance. Mixed with the bunch grass are occasional patches of sage brush. Most of the bluffs along the principal river valleys, especially in the counties of Ravalli, Missoula, Granite, Jefferson, Powell, Madison, and Powell, are clothed with sage brush; many of the lower mountain slopes, especially those along the western border, are clothed with heavy timber, yellow pine, red fir and tamarack being the principal species.

The climate is generally dry, although less so on the mountains and in the Flathead river basin than on the Great Plains, and is subject to sudden changes and to great extremes of temperature; but the temperature varies more than the amount of precipitation. The wind, the sun, and the temperature are greatly affected by the warm, dry " Chinook " wind which blows from the Pacific Ocean; to some extent the wind modifies the temperature nearly to the eastern border. It is the prevailing wind of winter in the mountains and in consequence the peaks of the higher country are cold, though often severe, are short. In the valleys the bottom lands along the rivers and streams considerable patches of cottonwood and willows are common. The mountain valleys are covered with little except grasses; on the higher parts of the mountains there are bare rocks or of a scant growth of timber; many of the lower mountain slopes, especially those along the western border, are clothed with heavy timber, yellow pine, red fir and tamarack being the principal species.

Soil. - In the river bottoms the soil is for the most part a black clay loam lacking in natural drainage, but on the " bench lands " higher up there is a deep layer of sandy loam beneath which is a bed of gravel. Some of the meadows of the valleys were once lakes and rich deposits of alluvium were made in them. The mountain slopes are often bare or covered only with a thin layer of mould.

Agriculture. - The rainfall is sufficient for good grazing, but except in the Flathead valley cultivation was long considered to be dependent on irrigation; and consequently farming was only incidental to stock raising and mining until after 1870, and as late as 1900 the ratio of improved farm land to the total land area was less than one in twenty. The growth of wheat and barley has long been the chief crop of the state; but with the introduction of new and valuable crops of durum, or macaroni wheat, and Russian barley, which is used in straw for winter feed and sheep cattle. The counties where dry farming had been carried on the longest are Ravalli, Missoula, Gallatin and Jefferson, where wheat, barley, and alfalfa are raised. In the counties of Ravalli, Jefferson, Gallatin, and Gallatin, where cereal yields, though not nearly so large as from irrigated lands, were high compared with the average for the country. But even where dry farming was successful, the increase of crops made it necessary to abandon it. Among the larger privately irrigated tracts are: 16,000 to 18,000 acres in Yellowstone county, fed by a canal built by the Billings Land & Irrigation Company; about 35,000 acres of which land is in the Bitter Root Valley in Ravalli county, irrigated by canals from Lake Como, a natural reservoir; and 100,000 acres in Missoula county, to be watered from a 28 ft. dam across the Clark Fork (or Missoula River) at Bonner. Private irrigation by pumping was first successfully introduced about 1901, and in 1906 a state report estimated that 125 pumping irrigation plants were in use in the state. Boring for underground water supply to be used in irrigation has been carried on since 1905. Irrigated land in Missoula county is watered by a ditch 10 m. long built in 1902-1905 by the co-operative Grass Valley-Frenchtown Irrigation Company, and the Teton Co-operative Canal Company in 1906 began work on a ditch 54 m. long. In Missoula county there are about 500 acres of land stored by a dam 62 ft. high and 2100 ft. long. But more important than private and co-operative undertakings are the Federal irrigation projects. In 1894 Congress passed the Carey Act, under which Montana received title to 1,000,000 acres of arid land on condition that it be improved. In 1898 the state would reclaim it by providing an adequate supply of water; the state accepted the offer, created an irrigation commission, and provided means for securing the necessary funds. Furthermore, Congress in 1902 appropriated the receipts from the sales of public lands in the state to be used in the construction of irrigation works. In 1899 there were 6812 m. of irrigation canals and large ditches in the state; the irrigated acreage had increased from 350,582 acres in 1889 to 951,154 acres in 1899, when about 82% of the irrigated area was in the latter. The external irrigation was in 1909. Among them were: the Huntley project in Yellowstone county, begun in 1901 and practically completed in 1908, covering land formerly in the Crow Indian reservation, the irrigable area being 200,000 acres. In 1907 the Federal Co-operative project (subsidiary St Mary project), in Chouteau, Valley and Teton counties, by which the water of St Mary river is stored and diverted to the headquarters of the Milk river to irrigate an area of 300,000 acres; the electric power projects in the upper Missouri river (Montana and Idaho counties), by which, as the ordinary flow of that river is already utilized for irrigation, the flood waters are stored and carried to the higher bench lands of the district; in Montana (Dawson county) the irrigation to be taken from the Flathead river (Kenzie county), the Lower Yellowstone project; and the Blackfeet project, to irrigate the Blackfeet reservation in Teton county.

In 1900, 11,444,454 acres, or 12.7% of the area, was in crops. This year, 1907, 17.7% of the area was in crops; 54.7% of the improved farm land was irrigated; 70.4% of the irrigated land was used for growing crops and 20.6% for pasture; the total acreage of all crops was 1,151,674, and of this 755,805, or 66.6% was irrigated. In the same year there were 13,370 farms exclusive of the irrigated lands; the irrigated farms were 2,235. The total number of acres was 175 acres each; 8045 contained more than 1000 acres each; 8045 contained some irrigated land, the average amount being 118 acres; 11,952 were worked by owners or part owners, 624 by cash tenants, and 15,724 acres each by share tenants.

Of the total acreage of all crops in 1899, 875,712 acres, or 76%, were hay and forage, and 254,231 acres, or 22.1% were cereals; of the cereal acreage 52.7% was oats, 39.2% was wheat, 9% was barley, and 5.3% are other crops. The average of barley for the state was 21.30 bu. The average of corn for the state was 8.6 bu. The average of hay for the state was 3.46 bu. The average of forage for the state was 4.09 bu. The average of oats for the state was 3.89 bu. The average of wheat for the state was 9.29 bu. The average of barley for the state was 2.13 bu. The average of all crops for the state was 2.50 bu.

Of the 1907 farming area, 35.4% was wheat, 32.5% corn, and 31.1% barley. The acreage of wheat was 2,089,617 acres; the acreage of barley was 1,539,000 bushels from 300,000 acres; the acreage of wheat in 1909 was 350,000 and the production 1,076,000 bushels; the acreage of barley in 1909 was 50,000 acres, and 1,000,000 bushels were raised. The acreage of wheat grown in Montana in 1909 was 950,000 acres, and 175,000 bushels were grown.

Sugar beets were first grown in Montana at Evans, Cascade county, in 1893 without irrigation. In 1906 a refinary (with a daily capacity of 300 tons of sugar) was built at Great Falls. In 1907, 1908, and 1909 the estimated acreage of sugar beet fields in Montana was 3,821,243. 

In 1904 the total amount of wheat grown in Montana was 9,574,000 bushels, and the value of all crops was $12,700,000.

The government is devoted chiefly to stock raising; for cattle, horses and sheep thrive well on the bunch grass except when it is covered with snow. The principal sheep-raising counties are Custer, Yellowstone, and Missoula, which are in the west. The number of sheep in Montana was 1,137,430,000, being exceeded only by those in Wyoming, Colorado and Idaho. The number of cattle was 922,000, only 68,000 being milch cows, and the number of horses 319,000.

Irrigated land. - Irrigated land area was estimated in 1900 at 22,000 sq. m., much of which had been burned over. It is confined mainly to the mountain slopes, and in March 1909 31,858 sq. m., more than three-fourths of which, had been set aside in the following " national forests ": Absaroka (980,440 acres), Beartooth (685,293 acres), Bitterroot (1,066,900 acres in Montana); and a smaller area in Idaho, Bitterroot (1,180,900 acres), Blackfeet (1,956,340 acres).

1 The St Mary and both forks of the Milk river flow northward into the Missouri. The project on the Milk river is designed to aid the irrigation both north and south of the international boundary, the present Federal project and other undertakings in the same region necessitate an international agreement as to the division of the water. The St Mary, and commissioners representing the Canadian government and the United States conferred in regard to it in May 1908.
Cabinet (1,020,960 acres), Custer (590,720 acres), Deedleford (1,080,220 acres), Flathead (2,002,785 acres), Gallatin (907,160 acres), Helena (930,180 acres), Jefferson (1,255,320 acres), Kootenai (1,561,260 acres), Lewis and Clark (844,130 acres), Lolo (1,211,680 acres), Madison (1,352,560 acres), Missoula (1,273,490 acres), and Sioux (145,253 acres in Montana; 104,400 acres in South Dakota). A large part of the woodland contains no trees fit for lumber; nevertheless the value of the lumber was $3,024,674 in 1905. More than one-third of the trees were red fir and tamarack. There is scarcely any hardwood timber in the state.

Minerals and Mining.—Mining has been the leading industry of Montana. The discovery of gold in 1862. It contains the largest copper producing district in the world, and in 1880 the value of copper was more than any other state or territory except Arizona; this constituted nearly three-fourths of the total value of the state's mining products in 1897. In 1905 the total value of copper and silver was $8,000,000. The annual value of silver was $1,800,000; the production of copper and silver combined is about $10,000,000 per year. Then copper mining rapidly developed and considerable gold was obtained from copper ores. Until the discovery of copper mining, silver was produced only in small quantities along with gold. The silver found with gold had a value of $24,000,000 in 1880 and $28,000,000 in 1890.

The mineral wealth of Montana is extensive and valuable. The most important minerals are in Silverbow, Jefferson, and Beaverhead counties. Gold was discovered in Deedleford county as early as 1852 but very little mining was done until ten years later. In 1863 the famous Alder Gulch in Madison county was discovered, and in 1864 was the discovery of the Great Northern at Helena. This was the start of the mining industry in Montana.

In 1865 the product reached its maximum, as the value of gold and silver combined (the value of the silver being relatively small) was $18,000,000; the production of copper and silver combined for the year was $10,000,000, and the value of the silver was only $1,800,000. Then copper mining rapidly developed and considerable gold was obtained from copper ores. Until the discovery of copper mining, silver was produced only in small quantities along with gold. The silver found with gold had a value of $24,000,000 in 1880 and $28,000,000 in 1890.

and if a tax-payer she may vote on all questions submitted to the tax-payers of the state or of any political division thereof.

The officers of the executive department are the governor, lieutenant-governor, secretary of state, attorney-general, treasurer, auditor and superintendent of public instruction, each of whom is elected for a term of four years. No person is eligible to any of these offices who shall not have lived within the state for two years next preceding the election; no person is eligible to the office of governor, lieutenant-governor, attorney-general or superintendent of public instruction who is not thirty years of age; no person is eligible to the office of secretary of state, treasurer or auditor who is not twenty-five years of age; no person is eligible to the office of attorney-general who has not been admitted to practice in the supreme court of the state; and the treasurer is ineligible to his office for the immediately succeeding term. The governor's powers are limited. As in other states he is commander-in-chief of the militia. With the advice and consent of the senate he appoints various administrative officers. With the approval of the majority of a board of pardons (composed of the secretary of state, attorney-general and auditor), he may pardon offences or commute punishment, and remit fines and forfeitures. He may veto any bill passed by the assembly, or in the case of a bill making appropriations of money he may veto any item of it, and no bill or item of an appropriation bill which he vetoes within five days (Sunday excepted) after it has been presented to him, can become a law or part of a law unless passed over his veto in each house by a two-thirds vote of the members present. Under an amendment to the Constitution adopted in 1906 his veto power does not extend to measures referred to the people by the legislative assembly or by initiative and referendum petitions. Without his approval, also, no order or resolution of either House, other than to adjourn or relating solely to the business of the assembly, can take effect until passed again by a two-thirds vote as in case of a bill.

The legislature consists of a senate and a house of representatives. Except when called in special session by the governor it meets (at Helena) on the first Monday of January in odd numbered years only, and the length of its session is limited by the constitution to sixty days. Senators are elected, one from each county, for a term of four years; representatives are elected, one or more from each county according to population, for a term of two years. The qualifications for a senator are that he be at least twenty-four years of age and have resided in his county or district at least one year next preceding his election; for a representative there are no qualifications other than those required for suffrage. The action of the legislature is much restricted by the constitution: a long list of cases is named in which that body is prohibited from passing any local or special laws; it is prohibited from delegating to any special commission power to perform any municipal functions whatever; from making any appropriations for charitable, industrial, educational or benevolent purposes to any person, corporation or community not under the absolute control of the state; and from authorizing the state to contract any debt or obligation in the construction of any railway, or to lend its credit in aid of such railway construction. In 1906 an amendment to art. 5, sec. 1 of the state constitution, authorized the initiative and referendum, but two-fifths of the entire number of counties must each furnish for initiative petitions signatures amounting in number to 8% of the whole number of votes cast for governor at the election last preceding the filing of the petition; for referendum petitions two-fifths of the counties must each furnish as signers 5% of the legal voters; and any measure referred to the people shall be in full force unless the petition for the referendum be signed by 15% of the legal voters (whose number is that of the total votes cast for governor, &c., as above) of a majority of the whole number of counties, but that in such case the law to be referred shall be inoperative until it is passed at the popular election.

The administration of justice is intrusted to a supreme court, an increasing number of district courts, and at least two justices' courts in each organized township, besides police and municipal courts. The supreme court is composed of a chief justice and two associate justices elected for a term of six years. It holds four sessions a year at Helena and has both original and appellate jurisdiction. For most district courts there is only one judge, but for the more populous there are two; they are all elected for four years. These courts have original jurisdiction in cases at law and in equity in which the value in controversy exceeds $50, in criminal cases amounting to felony, in all matters of probate, in actions for divorce, &c., and appellate jurisdiction in cases arising in the inferior courts. Justices of the peace are elected for two years and have civil jurisdiction in several classes of actions in which the amount demanded does not exceed $300, and in such cases as petit larceny, assault in the third degree and breach of the peace.

For purposes of local government the state is divided into counties; each county into townships, school districts and road districts; and there is an incorporator for each. The county officers are a board of three commissioners, a treasurer, a sheriff, a county clerk, a clerk of the district court, an attorney, a surveyor, a coroner, a public administrator, an assessor, a superintendent of schools, and in some instances, an auditor. The commissioners are elected for six years, the other officers, for two years. Among the commissioners' powers and duties are: the management of county property; the levying of taxes; the equalizing of assessments; the division of the county into townships, school districts and road districts; the laying out and management of public highways and ferries, and the care of the poor. The township is of minor importance, its principal officers being two justices of peace and two constables. Municipal corporations are classified according to population; those having 10,000 inhabitants or more are cities of the first class; those having less than 1,000 but more than 5,000 inhabitants, cities of the second class; those having more than 1,000 inhabitants, cities of the third class, and those having less than 1,000 but more than 300 inhabitants towns. In a city of the first class, a mayor, two aldermen from each ward, a police judge, and a treasurer who may be ex officio tax-collector are elected, and an attorney, a clerk, a chief of police, an assessor, a street commissioner, a jailer, a surveyor, and, where there is a paid fire department, a chief engineer with one or more assistants, may be appointed by the mayor with the consent of the council. The officers of cities of the second and third class are the same, except that the clerk is ex officio assessor. In towns only a mayor and aldermen are elected, and the mayor with the consent of the council appoints a clerk who is ex officio assessor, a treasurer who is ex officio collector, and a marshal who may be ex officio street commissioner. The principal municipal officers hold office for two years.

A wife may hold property and make contracts as if she were single, and no property held by her on her marriage is liable to assign for the support of her husband or for the payment of his debts.

The husband is required to support himself and his wife if he is able to do so; if he is unable, his wife is required to assist him. On the death of either husband or wife at least one-third of his or her property must be set apart for the support of the surviving spouse. Adultery, extreme cruelty, wilful desertion, wilful neglect, habitual intemperance or conviction for felony. The homestead of a head of a family consisting either of a farm not exceeding 160 acres or $2500 in value, or a lot not exceeding $2500 in value, and the house and lot not exceeding $2500 in value—is secured against debts except in case of judgments obtained before the homestead was recorded as such, in case of the contractors', mechanics' or workmen's liens, in the case of executions, by mortgage; if the owner is a married person the homestead cannot be mortgaged without the consent of both husband and wife. For the settlement of disputes between labourers and employers there is a state board, appointed by the governor and consisting of an employer of labour, a labourer and a disinterested citizen; no application on either side or both of the parties, provided the employees be not less than twenty, this board is required to inquire into the cause of the dispute, with the aid of two expert assistants, who shall be nominated by the parties, and to render a decision, which is binding for at least six months upon the parties to the application.

Charitable and Penal Institutions.—These are a state prison at Deer Lodge, managed by contract; a reform school at Miles City, an infantry station at Butte, an orphan's home at Twin Bridges, the soldiers' home at Columbia Falls, a school for deaf and blind
at Boulder, and an insane asylum at Warm Springs, managed by private interests. They are all under the supervision of a state board of
charities and reform. The state also has a bureau of child and animal protection.

The state public school system is administered by the state, county, and district officers. The common school of each district is under the immediate supervision of a board of trustees; but a state

The superintendent of public instruction passes judgment on publications for use in school libraries, and

The county superintendent of schools. A county board of education examines applicants for teachers' positions and pupils applying for high schools. The county superintendents are subject to the teachers, and holds teachers' institutes. Each school district is

The state legislative biennially fixes the rate of taxes for state purposes; the amount of this levy is now limited by the legislature to 2% of the assessed valuation, of which 1% is for high schools, 0.5% for county schools; 1% for roadbed, and 0.5% for streets. The state law requires the

Finance.—About one-half of the revenue for state and county purposes is derived from a general property tax. All taxable property in each county except that of railways in more than one county, and mines in all counties, is valued and taxed at its true value. The state board of equalization is composed of the governor, attorney general, and auditor, and is appointed by the governor for a term of years, with the advice and consent of the Senate.

The entire educational system is maintained very largely out of funds derived from lands appropriated by Congress for that purpose.

History.—The first exploration within the borders of Montana was made in 1743 by Sieur de la Verendrye, who in that year led an expedition up the Missouri river to the Great Falls and near Helena now stands; the first exploration in that part of the state which lies west of the main range of the Rocky Mountains was made by Meriwether Lewis and William Clark in 1805. That part which lies east of the mountains was included in the Louisiana Purchase of 1803 and became successively a part of Missouri Territory in 1812, of Nebraska Territory in 1854, of Dakota Territory in 1861 and of Idaho Territory in 1863; that which lies west of the mountains became successively a part of Oregon Territory in 1848, of Washington Territory in 1853 and of Idaho Territory in 1863. In 1864 Montana Territory was created, and in 1889 this Territory was admitted to statehood. The report of Lewis and Clark attracted many traders and trappers, and within a few years the Missouri Fur Company, the Rocky Mountain Fur Company, the Hudson's Bay Company, and the Astor House established fortified trading posts on the Missouri, the Yellowstone, the Marias, the Milk and other rivers; the most prominent among these was Fort Benton, which was established in 1846 at the head of navigation on the Missouri, and was made the headquarters of the American Fur Company. In 1841 Father

Peter John De Smet (1801-1872), a Belgian Jesuit missionary established Saint Mary's Mission in Bitter Root Valley, but, as the Indians repeatedly attacked the mission, it was abandoned in 1850. Fort Owen was, however, established in its place and continued for several years the chief settlement west of the mountains.

The development of Montana was scarcely begun when the discoveries of gold were made at Bannack, Beaverhead Valley, in 1862, at Virginia city, Alder Gulch, in 1863 and at Helena, Last Chance Gulch, in 1864. Several thousand people now rushed in, and before the Territorial government was created, the gold districts and the roads thereto suffered from a reign of lawlessness. The citizens organized a "vigilance committee" and hanged many of the outlaws. Many traders and trappers were butchered by the Indians, who became still more troublesome after the invasion of the Territory by the gold-seekers, and the surveying of railway routes had been undertaken. Treaties and military operations were at first of no avail, but in 1876 the United States government took steps to reduce them to submission, and Generals George Crook (1828-1890), Alfred Howe Terry (1827-1890) and John Gibbon (1827-1890), with 3,700 troops (besides the Crow scouts) were sent against the Sioux under Sitting Bull, Crazy Horse and others. On the 17th of June, George Custer was killed at the Little Big Horn, where the Sioux were first discovered. Custer divided his regiment into four commands, his own comprising 262 men. Continuing a few miles down stream, he came upon what was supposed to be a single Sioux village; the Indians, however, proved to number from 800 to 10,000, including 2,500 to 3,000 warriors. Custer was soon completely surrounded and the entire command, save a single Crow scout, was slaughtered. This was, however, the beginning of the end of the Indian troubles. On the 29th of September a band under American Horse was defeated and their leader killed; in October some 3,000 Indians surrendered; and on the 22nd of April 1877, 2,000 more under Crazy Horse laid down their arms. General Crook and Colonel Nelson A. Miles especially distinguished themselves. In October 1877 the Nez Percé under Chief Joseph after a masterly retreat from Idaho of 1,000 miles, probably unequalled in Indian warfare, were hemmed in by greatly superior forces and captured in the Bear Paw Mountains in Chouteau county.

In most of the territorial or state elections the Democrats, or the Democratic-Republicans, have been triumphant, a Republican governor having been elected only in 1857; but the contests have often been ardent and bitter. In 1889 the Democrats were charged with fraud in the 34th election precinct of Silverbow county, and the dispute remaining unsettled, two legislatures were seated. Each legislature elected two senators to the United States Senate, which, having a Republican majority, seated the Republicans. More notable, however, was the feud between W. A. Clark and Marcus Daly, both Democrats. William Anderson Clark (b. 1839) removed in 1856 from Pennsylvania to Iowa, in 1862 to Colorado and in 1863 to Montana, where he became the wealthiest mine-owner. Marcus Daly (1842-1900) went from Ireland about 1857 to New York City, and thence to California and Nevada, and in 1876 reached Butte, Montana. In 1882 he discovered one of the richest copper deposits in the world. Clark aspired to be a United States senator, but by ridiculing Daly, provoked a powerful opposition. Clark was one of the two Democratic claimants who had been denied a seat in the senate in 1890. Three years later he was again nominated, but Daly prevented his election. Clark secured his election to the senate in 1899, but Daly furnished to the Committee on Elections and Privileges the evidence of bribery and fraud that it decided against seating him. Daly died on the 24th of November 1900, and in 1901 Clark was elected senator for the term, which expired in 1907, when he was succeeded by Joseph Morgan Dixon (b. 1867), a Republican.
The governors of Montanista have been as follows:—

**MONTANELI,** GIUSEPPE (1813-1862), Italian statesman and author, was born at Fucecchio in Tuscany, and in 1840 was appointed law professor at Pisa. He contributed to the Antologia, a celebrated Florentine review, and in 1847 founded a newspaper called L'Italia, the programme of which was "Reform and Nationality." In 1848 Montanelli served with the Tuscan student volunteers at the battle of Curtatone, where he was wounded and taken prisoner by the Austrians. On being liberated he returned to Tuscany, and the grand duke Leopold II, knowing that he was popular with the masses, sent him to Leghorn to quell the disturbances. In October, Leopold, much against his inclinations, asked him to form a ministry. He accepted, and on the 10th of January 1849, induced the grand duke to establish a national constituent assembly. Leopold, alarmed at the turn affairs were taking, fled from Florence, and Montanelli, Guerazzi and Mazzini were elected "constitutivi" of Tuscany. Like Mazzini, Montanelli advocated the union of Tuscany with Rome. But after the restoration of the grand duke, Montanelli, who was in Paris, was tried and condemned by default; he remained some years in France, where he became a partizan of Napoleon III. On the formation of the kingdom of Italy he returned to Tuscany and was elected member of parliament; he died in 1862. He was an enthusiastic, but aickle and ambitious demagogue, and he achieved a better reputation as a writer.

His most important literary work is his Memorie sull'Italia e specialmente sulla Toscana dal 1814 al 1859, in 2 vols. (Turin, 1853). He also published II Partito nazionale italiano (Turin, 1860), L'Empero, il papato, e la monarchia in Italia (Florence, 1859); and Dell'ordinamento nazionale in Italia (Florence, 1862). His dramatic poetry La Tentazione and his tragedy Coma achieved some success in their day. Among his works were: G. Toscanelli e la Toscana dal 1851 al 1856 (Rome, 1909).

**MONTAÑES, JUAN MARTINEZ** (c. 1580-1649), Spanish sculptor, was born at Alcalá-la-real, in the province of Granada. His master was Pablo de Rosas, his first known work (1607) being a boy Christ, now in the sacristy of the capilla antigua in the cathedral of Seville. The great altar at Santiponce near Seville, was completed in 1812. Montanés executed most of his sculpture in wood, covered with a surface of polished gold, and coloured. Other works were the great altars at Santa Clara in Seville and at San Miguel in Jerez, the Conception and the realistic figure of Christ crucified, in the Seville cathedral; the figure of St John the Baptist, and St Bruno (1620); a tomb for Don Perez de Guzman and his wife (1619); the St Ignatius and the St Francis of Borja in the university church of Seville. Montañes died in 1649, leaving a large family. His works are more realistic than imaginative, but this, allied with an impeccable taste, produced remarkable results. The equestrian statue of King Philip IV., caste in bronze by Pietro Tacca in Florence and now in Madrid, was modelled by Montañes. He had many imitators, his son Alonzo Martinez, who died in 1668, being among them.

See B. Haendeke, *Studien zur Geschichte der spanischen Plastik* (Strassburg, 1900); and F. Gomez, *Historia de la escultura en España* (Madrid, 1885). **MONTANISM**, a somewhat misleading name for the movement in the 2nd century which, along with Gnosticism, occupied the most critical period in the history of the Early Church. It was the overthrow of Gnosticism and Montanism that made the "Catholic" Church. The credit of discovering the true significance of the many kinds of beliefs and practices. It was not until the 17th century that the various attempts to explain the doctrine of the Church and the history of the Church in the centuries which followed by a sketch of its origin, development and decline.

1. From the middle of the 2nd century a change began to take place in the outward circumstances of Christianity. The Christian faith had hitherto been maintained in a few small congregations scattered over the Roman Empire. These congregations were provided with only the most indispensable constitutional forms. But we now no longer swayed all minds. In many cases sober convictions or a remarkable assertion supplied the want of spontaneous enthusiasm. There were many who did not become, but who were, and therefore remained, Christians. Then, in addition to this, Christians were already found in all classes and occupations—men in the Imperial palace, among the officials, in the abodes of labour and the halls of learning, amongst slaves and freemen. Should the Church take the decisive step into the world, conform to its customs, and acknowledge as far as possible its authorities? Or ought she, on the other hand, to remain a society of religious devotees, separated and shut out from the world? That this was the question at issue is obvious enough now, although it could not be clearly perceived at the time. It was natural that warning voices should then be raised in the Church against secular tendencies, that the well-known counsel about the imitation of Christ should be held in their literal strictness before worldly Christians. The Church as a whole, however, under pressure of circumstances rather than by a spontaneous impulse, decided otherwise. She marched through the open door into the Roman state, and settled down there to Christianize the state by imparting to it the word of the Gospel, but at the same time leaving it everything except its gods. On the other hand, she furnished herself with anything at all, i.e. the value that could be taken over from the world without overstraining the elastic structure of the organization which she now adopted. With the aid of its philosophy she created her new Christian theology; its policy furnished her with the most exact constitutional forms; its jurisprudence, its trade and commerce, its art and industry, were all taken into her service; and she contrived to borrow some hints even from its religious worship. With this equipment she undertook, and carried through a world-mission on a grand scale. But believers of the old school protested in the name of the Gospel against this secular Church. They joined an enthusiastic movement which had originated in a remote province, and had at first a merely local importance. There, in Phrygia, the cry for a strict Christian life was reinforced by the belief in a new and final outpouring of the Spirit—a coincidence which has been observed elsewhere in Church history—as, for instance, among the early Quakers and the Irvingite movement. These

zealots hailed the appearance of the Paraclete in Phrygia, and surrendered themselves to his guidance. In so doing, however, they were led to shed blood from the Church, to be known as "Montanists," or "Kataphrygians," and thus to assume the character of the sect. Their enthusiasm and their prophesies were denounced as demoniacal; their expectation of a glorious earthly kingdom of Christ was stigmatized as Jewish, their passion for martyrdom as vainglorious and their whole conduct as hypocritical. Nor did they escape the more serious imputation of heresy on important articles of faith; indeed, there was a disposition to put them on the same level with the Gnostics. The effect on themselves was what usually follows in such circumstances. After their separation from the Church, they became narrower and pettier in their conception of Christianity. Their asceticism degenerated into legalism, their claim to a monopoly of pure Christianity made them arrogant. As for the popular religion of the larger Church, they scorned it as an adulterated, manipulated Christianity. But these views found very little acceptance in the 3rd century, and in the course of the 4th they died out.

2. Such is, in brief, the position occupied by Montanism in the history of the Christian Church. The rise and progress of the movement may be followed:

At the close of the reign of Antoninus Pius—probably in the year 156 (Epiphanius)—Montanus appeared at Ardabau in Myasia, near the Phrygian border, bringing revelations of the "Spirit" to Christendom. Montanus claimed to have a prophetic calling in the very same sense as Agabus, Judas, Silas, the daughters of Philip, Quadratus and Ammia, or as Hermas at Rome. At a later time, when the validity of the Montanistic prophecy was called in question, the adherents of the new movement appealed explicitly to a sort of prophetic succession, in which their prophets had received the same gift which the daughters of Philip, for example, had exercised in that very country of Phrygia. The burden of the new prophecy seems to have been a new standard of moral obligations, especially with regard to marriage, fasting and martyrdom. But Montanists had larger schemes in view. He wished to organize a special community of true Christians to wait for the coming of their Lord. The small Phrygian towns of Pepuz and Tymion were selected as the headquarters of his church. Funds were raised for the new organization, and from these the leaders and missionaries, who were to have nothing to do with worldly life, drew their pay. Only two women, Prisca and Maximilla, were moved by the Spirit; like Montanus, they suffered in a state of frenzy the commands of the Spirit, which urged men to a strict and holy life. This does not mean that visions and significant dreams may not have been of frequent occurrence in Montanism. 1

For twenty years this agitation appears to have been confined to Phrygia and the neighboring provinces. But after the year 177 a persecution of Christians broke out simultaneously in many provinces of the Empire. Like every other persecution it was regarded as the beginning of the end. It would seem that before this time Montanus had disappeared from the scene; but Maximilla, and probably also Prisca, were working with redoubled energy. And now, throughout the provinces of Asia Minor, in Rome, and even in Gaul, amidst the raging of persecution, attention was attracted to this remarkable movement. The desire for a sharper exercise of discipline, and a more decided renunciation of the world, combined with a craving for some plain indication of the Divine will in these last critical times, had prepared many minds for an eager acceptance of the tidings from Phrygia. And thus, within the large congregations where there was so much that was open to censure in doctrine and constitution and morals, conventicles were formed in order that Christians might prepare themselves by strict discipline for the day of the Lord.

Meanwhile in Phrygia and its neighbourhood—especially in Galatia, and also in Thrace—a controversy was raging between the adherents of the new prophecy. Between 150 and 176 the authority of the bishops had been immensely strengthened, and along with it a settled order had been introduced into the Churches. As a rule, the bishops were resolute enemies of the Montanistic enthusiasm. It disturbed the peace and order of the congregations, and threatened their safety. Moreover, it made demands on individual Christians such as very few could comply with. But the disputation which Bishops Zoticus of Cumana and Julian of Apamea arranged with Maximilla and her following turned out disastrously for its promoters. The "spirit" of Maximilla gained a signal victory, a certain Thymi in particular having reduced the bishops to silence. Sotis bishop of Anchialus attempted to refute Prisca, with but no better success (Eusebius, Hist. eccl. v. 19). These proceedings were never forgotten in Asia Minor, and the report of them spread far and wide. In after times the only way in which the discomfiture of the bishops could be explained was by asserting that they had been silenced by fraud or violence. This was the commencement of the excommunication or secession of the Montanists. The latter, or at least the Newer, was the sect which did rise in Asia Minor rejecting all prophecy and the Apocalypse of John along with it, but the majority of the Churches and bishops in that district appear (c. 178) to have broken off all fellowship with the new prophets, while books were written to show that the very form of the Montanistic prophecy was sufficient proof of its spuriousness. 2 In Gaul and Rome the prospects of Montanism seemed for a while more favourable. The confessors of the Gallican Church at Lyons were of opinion that communion ought to be maintained with the zealots of Asia and Phrygia; and they addressed a letter to this effect to the Roman bishop, Eleutherus. There was a momentary vacillation even in Rome. Nor is this to be wondered at. The events in Phrygia could not appear new and unprecedented to the Roman Church. If we may believe Tertullian, it was Praxens of Asia Minor, the relentless foe of Montanism, who succeeded in persuading the Roman bishop to withhold his letters of conciliation. 3

Early in the last decade of the 2nd century two considerable works appeared in Asia Minor against the Kataphrygians. The first, by a bishop or presbyter whose name is not known, is addressed to Abirius bishop of Hierapolis, and was written in the fourteenth year after the death of Maximilla—i.e. apparently about the year 193. The other was written by a certain Apollonius forty years after the appearance of Montanus, consequently about 196. From these treatises we learn that the adherents of the new prophecy were very numerous in Phrygia, Asia and Galatia (Ancrya), that they had tried to defend themselves in writing from the charges brought against them (by Miitides), that they possessed a fully developed independent organization, that they boasted of many martyrdoms, and that they were still formidable to the Church in Asia Minor. Many of the small congregations had gone completely over to Montanism, although in large towns, like Ephesus, the opposite party maintained the ascendency. Every bond of intercourse was broken, and in the Catholic Churches the worst calumnies were retailed about the deceased prophets and the leaders of the sects whom they had founded. In many Churches outside of Asia Minor a different state of matters prevailed. Those who accepted the message of the new prophecy did not at once leave the Catholic Church in a body. They simply formed small conventicles within the Church. Such, for example, appears to have been the case in Carthage (if we may judge from the Acts of the martyrs Perpetua and Felicitas) at the commencement of the persecution of Septimius Severus about the year 202. But even here it was impossible that an open rupture

1 Theodotus, "the first steward of the New Prophecy," was a fellow-worker with Montanus, and almost certainly a prophet. Later on, Firmilian, writing to Cyprian, mentions a prophet who appeared in Cappadocia about A.D. 236, and Epiphanius (Haer. 49) tells of another called Quintilla. (Ed.)

2 Miitides, πατέρα μου δεμυ προφητη απ συμπτάκελαν. At the same time as Miitides, if not earlier, Apollonius of Hierapolis also wrote against the Montanists.

3 It was Zephyrus in A.D. 202 who took the decisive step of refusing to communicate with the Asiatic Montanists. (Ed.)

Quoted in Eusebius, Hist. eccl. v. 16-18.
should be indefinitely postponed. The bishops and their flocks gave offence to the spiritualists on so many points that at last it could be endured no longer. The latter wished for more fasting, the prohibition of second marriages, a frank, courageous profession of Christianity in daily life, and entire separation from the world; the bishops, on the other hand, sought to make it as easy as possible to be a Christian, lest they should lose the greater part of their congregations. And lastly, the bishops were compelled more and more to take the control of discipline into their own hands, while the spiritualists insisted that God Himself was the sole judge in the congregation. On this point especially a conflict was inevitable. It is true that there was no rivalry between the new organization and the old, as in Asia and Phrygia, for the Western Montanists recognized in its main features the Catholic organization as it had been developed in the contest with Gnosticism; but the demand that the "organs of the Spirit" should direct the whole discipline of the congregation contained implicitly a protest against the actual constitution of the Church. Even before this latent antagonism was made plain there were many minor matters which were sufficient to precipitate a rupture in particular congregations. In Carthage, for example, it would appear that the relations between the Catholic Church and the Montanist conventicle was caused by a disagreement on the question whether or not virgins ought to be veiled. For nearly five years (202-207) the Carthaginian Montanists strove to remain within the Church, which was as dear to them as it was to their opponents. But at length they quitted it, and formed a congregation of their own.

It was at this juncture that Tertullian, the most famous theologian of the West, left the Church whose cause he had so manfully upheld against pagans and heretics. He too had come to the conviction that the Church had forsaken the old paths and entered on a way that must lead to destruction. The writings of Tertullian afford the clearest demonstration that what is called Montanism was, at any rate in Africa, a reaction against secularism in the Church. There are other indications that Montanism in Carthage was a very different thing from the Montanism of Montanus. Western Montanism, at the beginning of the 3rd century, admitted the legitimacy of almost every point of the Catholic system. It allowed that the bishops were the successors of the apostles, that the Catholic rule of faith was a complete and authoritative exposition of Christian society, and that the New Testament was the supreme rule of the Christian life. Montanus himself and his first disciples had been in quite a different position. In his time there was no fixed, divinely instituted congregational organization, no canon of New Testament Scriptures, no anti-Gnostic theology, and no Catholic Church. There were simply certain communities of believers bound together by a common hope, and by a free organization, which might be modified to any required extent. When Montanus proposed to summon all true Christians to Pepuza, in order to live a holy life and prepare for the day of the Lord, there was nothing whatever to prevent the execution of his plan except the inertia and lukewarmness of Christendom. But this was not the case in the West at the beginning of the 3rd century. At Rome and Carthage, and in all other places where Montanism beheld no longer, the latter wished for more discipline. Tertullian put an end to the Catholic Church, and they had neither the courage nor the inclination to undermine her sacred foundations. This explains how the later Montanism never attained a position of influence. In accepting, with slight reservations, the results of the development which the Church had undergone during the fifty years from 160 to 210 it reduced itself to the level of a sect. Tertullian exhausted the resources of dialectic in the endeavour to define and vindicate the relation of the spiritualists to the "psychic" Christians; but no one will say he has succeeded in clearing the Montanist position of its fundamental inconsistency.

Of the later history of Montanism very little is known. But it is at least a significant fact that prophecy could not be resuscitated. Montanus, Prisca, and Maximilla were always recognized as the inspired authorities. At rare intervals a vision might perhaps be vouchsafed to some Montanist old woman, the original might not and then have a dream that seemed to be of supernatural origin; but the overmastering power of religious enthusiasm was a thing of which the Montanists knew as little as the Catholics. Their discipline was attended with equally disappointing results. In place of an intense moral earnestness, we find in Tertullian a legal casuistry, a finical morality, from which no good could ever come. It was only in the land of its nativity that Montanism held its ground till the 4th century. It maintained itself there in a number of close communities, probably in places where no Catholic congregation had been formed; and to these the Novatians at a later period attached themselves. In Carthage there existed down to the year 400 a sect called Tertullianists; and in their survival we have a striking testimony to the influence of the great Carthaginian teacher. On doctrinal questions there was no real difference between the Catholics and the Montanists. The early Montanists (the prophets themselves) used expressions which seem to indicate a Monarchian conception of the person of Christ. After the close of the 2nd century we find two sections amongst the Montanists, one in the West, and amongst the Western Catholics—there were some who adopted the Logos-Christology, and others who remained Monarchians.

Sources.—The materials for the history of Montanism, although plentiful, are fragmentary, and require a good deal of critical sitting. They may be divided into four groups: (1) the utterances of Tertullian and his predecessors, p. 4; (2) the works written by Tertullian after he became a Montanist and furnish the most copious information—nor, however, about the Montanism of Carthage; (3) the earliest orthodox writers give currency to many misconceptions and calumnies. (4) The later lists of heretics, and the casual notices of Church fathers from the 3rd to the 5th century, though not containing much that is of value, yet contain a little.

1 It is evident that Montanism was by no means homogeneous. The "catholic" or the primitive "heresy" of the Phrygians has been studied in the light of the matured system of Tertullian. One great difference is manifest: Tertullian never himself deviated from orthodoxy and vehemently asserts the orthodoxy of all Montanists, but both Montans ("I am the father and the Son and the Holy Ghost") and Tertullianists ("I am the father") have a Monarchian language which has a distinctly "monarchic" flavour. There were really divided views on the question of the Divine Monarchy among the Monarchians as among the Catholics. The orthodox party were known as Catholici; the Monarchians as Catapropici; and the latter appeared to the oracles of their prophets. Other influences tending to diversity were the rise of later prophets and visionaries, the personality of prominent members of the sect (like Tertullian himself, w. Oecumenical Studies for July 1906, v. xix, p. 319). It is probable that Tertullian was acquainted with the views of his predecessors on the subject of the Monarchy of Christ, and that he himself carefully revised from it, and the power of local environment. An examination of Phrygian as distinct from African Montanism leads to the following conclusions: (1) The Phrygians claimed to have received the prophetic gift by way of succession just as the bishops traced their office back to the apostles; Tertullian seems to ignore the intermediate steps between the apostles and Montans; (2) the "ecstasy" of the African section was much more restrained than the ravings of the Phrygians; (3) the Montanists of the West were more centric in assigning a prominent place to women, Tertullian on the other hand (De virg. vol. 9) says, "It is not permitted to a woman to speak in church, nor yet to teach, nor to baptize, nor to offer, nor to administer the eucharist, nor to sit in the council of the fathers;" (4) while both sections gave to prophets the power of absolution, the Phrygians extended it to martyrs also—at Carthage the Catholics did this contrary to the views of Tertullian. There is also a good reason to doubt whether the Phrygian Montanists were as much disposed to accept as the Denizen of Pepuza the doctrine of the Holy Spirit as described by the Montanists of Carthage; (5) the disciplinary constitution of the Montanists of Carthage has been generally considered. Apollonius (Eusebius, Hist. Eccl. v. 16) accuses them of covetousness and tells us that Thamos purchased his freedom from imprisonment by a considerable payment. Sir Moncure D. Morris has with reason declared that the Montanists were rare during the end of the 2nd and the whole of the 3rd century, a spirit of religious compromise prevailing between the Christian and pagan populations (see a paper by H. J. Lawlor in the Journal of Biblical Theology for July 1906, v. xix, p. 319). It is probable that Tertullian was acquainted with the views of his predecessors on the subject of the Monarchy of Christ, and that he himself carefully revised from it, and the power of local environment. An examination of different sections of Montanism leads to the following conclusions: (1) The Phrygians claimed to have received the prophetic gift by way of succession just as the bishops traced their office back to the apostles; Tertullian seems to ignore the intermediate steps between the apostles and Montans; (2) the "ecstasy" of the African section was much more restrained than the ravings of the Phrygians; (3) the Montanists of the West were more centric in assigning a prominent place to women, Tertullian on the other hand (De virg. vol. 9) says, "It is not permitted to a woman to speak in church, nor yet to teach, nor to baptize, nor to offer, nor to administer the eucharist, nor to sit in the council of the fathers;" (4) while both sections gave to prophets the power of absolution, the Phrygians extended it to martyrs also—at Carthage the Catholics did this contrary to the views of Tertullian. There is also a good reason to doubt whether the Phrygian Montanists were as much disposed to accept as the Denizen of Pepuza the doctrine of the Holy Spirit as described by the Montanists of Carthage; (5) the disciplinary constitution of the Montanists of Carthage has been generally considered. Apollonius (Eusebius, Hist. Eccl. v. 16) accuses them of covetousness and tells us that Thamos purchased his freedom from imprisonment by a considerable payment. Sir Moncure D. Morris has with reason declared that the Montanists were rare during the end of the 2nd and the whole of the 3rd century, a spirit of religious compromise prevailing between the Christian and pagan populations (see a paper by H. J. Lawlor in the Journal of Biblical Theology for July 1906, v. xix, p. 319).
MONTARGIS—MONTAUSIER

LITERTURIE.—Ritschel's investigations referred to above, superseded the older works of Tillemon, Wernsdlorl, Mosheim, Walch, Neander, Baur and A. Schwegel (Der Montanismus und die christliche Kirche des zehnten Jahrhunderts, Tübingen, 1841). The later works, of which the chief was that of N. Bonwetsch, Die Geschichte des Montanismus (1881), all follow the lines laid down by Ritschel. See also Gottwald, De montanism Tertulliani (1882); Réville, "Tertullien et le montanisme" in the Revue des deux mondes (Nov. 1, 1864); Strong, "The Montanists," in The Southern Quarterly and the Primitive Church (London, 1878); W. Cunninghan, The Churches of Asia (London, 1880); Renan, "Les Crises du Catholique Naisse" in Rev. d. deux mondes (Feb. 15, 1881); H. Weinel, Die Wirkungen des Glauben der Götter (Freiburg in Breisgau, 1869); G. G. Selwiy, The Christian Prophecy (London, 1900); Bonwetsch, art. "Montanismus" in Hauck-Herzog's Realencyklopädie. Special points of importance in the history of Montanism have been investigated by L. E. Overbeck, Die Entwicklung des Glauben des Gottes (Freiburg, 1871); W. Harnack, Das Männchen, seine Idee and seine Geschichte, 2nd ed., 1882; Eng. trans., 1901; and Z. f. Kirchengesch. iii. 369-408, and H. J. Lawlor. Weisskeller's short essays are extremely valuable, and have elucidated several important points which had been overlooked.

MONTARGIS, a town of central France, capital of an arrondissement in the department of Loiret, 47 m. E.N.E. of Orléans by rail. Pop. (1906), 11,038. The town is traversed by the Vernisson, by numerous arms of the Loing, and by the Briare canal, which unites with the canal of Orléans a little below it. It has a church (St Madeleine), dating in part from the 12th century and including a fine choir of Renaissance architecture, and still preserves portions of its once magnificent castle (12th to 15th centuries), which, previous to the erection of Fontainebleau, was a favourite residence of the royal family. A handsome modern building contains the town-hall, public library, and museum; in the courtyard is a bronze group, "The Dog of Montargis," the town has a statue of Mirabeau, born in the neighbourhood. Montargis is the seat of a sub-prefecture, and has tribunals of first instance and of commerce and colleges for both sexes. It manufactures paper, gold chains, rubber, tar, asphalt, chemical manures, woodwork and leather. The town is an agricultural market, and its port has trade in coal, timber, sheep and farm produce.

Montargis was formerly the capital of the Gâtinais. Having passed in 1188 from the Courtenay family to Philip Augustus, it long formed part of the royal domain. In 1528 Francis I. gave it as dowry to Renée d'Este, daughter of Louis XII., the famous Huguenot princess; from her it passed to her daughter Anne, and through her to the dukes of Guise; it was repurchased for the Crown in 1612. From 1626 till the Revolution the territory was the property of the house of Orléans. Montargis was several times attacked or attacked by the English in the 15th century, and is particularly noted for its successful defence in 1427. Both Charles VII. and Charles VIII. held court in the town; it was the latter who set the famous Dog of Montargis to fight a duel with his master's murderer whom he had tracked and captured.

MONTAUBAN, ARTHUR DE (d. 1479), French magistrate and prelate, belonged to one of the great families of Brittany. To satisfy a private grudge against Gilles, brother of Duke Francis II. of Brittany, he intrigued to such good purpose that Gilles was arraigned for treason, and finally assassinated in prison in 1450. When Montauban's duplicity was discovered he was deprived of his office of bailli of Cotentin and banished. He then turned monk, and through the support of his brother, John de Montauban (1412-1466), Louis XI.'s favourite, obtained the archbishopric of Bordeaux in 1465. He died in Paris on the 6th of March 1479.

MONTAUBAN, a town of south-western France, capital of Tarn-et-Garonne, 31 m. N. of Toulouse by the Southern railway. Pop. (1906), town, 16,513; commune, 28,688. The town, built mainly of a reddish brick, stands on the right bank of the Tarn at its confluence with the Garonne (1285). It is reached by boulevards beyond which extend numerous suburbs, while on the left bank of the Tarn is the suburb of Villebounjou, which is connected with the town by a remarkable bridge of the early 14th century. It is a brick structure over 200 yds. in length, and though its fortified towers have disappeared it is otherwise in good preservation. The hôtel de ville, on the site of a castle of the counts of Toulouse and once the residence of the bishop of Montauban, stands at the east end of the bridge. It belongs chiefly to the 17th century, but some portions are much older, notably an underground chamber known as the Hall of the Black Prince. Besides the municipal offices it contains a valuable library, and a museum with collections of antiquities and pictures. The latter comprise most of the work (including his "Jesus among the Doctors") of Jean Ingres, the celebrated painter, whose birth in Montauban is commemorate by an elaborate monument. The Place Nationale is a square of the 17th century, entered at each corner by gateways giving access to a large open space surrounded by houses carried on double rows of arcades. The prefecture, the law-courts and the remaining public buildings are modern. The chief churches of Montauban are the cathedral, remarkable only for the possession of the "Vow of Louis XIII.," one of the masterpieces of Ingres, and the church of St Jacques (14th and 15th centuries), the façade of which is surmounted by a handsome octagonal tower. Montauban is the seat of a bishop, a prefect and a court of assize. It has tribunals of first instance and of commerce, a chamber of commerce and industry and a court of trade arbitration, lycées and a training college, schools of commerce, and even of the Bank of France, and a faculty of Protestant theology. The commercial importance of Montauban is due rather to its trade in agricultural produce, horses, game and poultry, than to its industries, which include nursery-gardening, cloth-weaving, cloth-dressing, flour-milling, wool-sawing, and the manufacture of furniture, silk-gauze and straw hats. The town is a junction of the railways of the Southern and Orléans companies, and communicates with the Garonne by the Canal of Montech.

With the exception of Mont-de-Marsan, Montauban is the oldest of the bastides of southern France. Its foundation dates from 1144 when Alphonse Jourdain, count of Toulouse, granted it a liberal charter. The inhabitants were drawn chiefly from Montauroil, a village which had grown up around the neighbouring monastery of St Théodard. In the 13th century the town suffered much from the ravages of the Albigensians and from the Inquisition, but by 1717 it had recovered sufficiently to be chosen by John XXII. as the head of a diocese of which the bishopric of St Théodard became the cathedral. By the treaty of Bréguay (1560) it was ceded to the English; but in 1414 they were expelled by the inhabitants. In 1560 the bishops and magistrates embraced Protestantism, expelled the monks, and demolished the cathedral. About ten years later it became one of the Huguenot strongholds, and formed a small independent republic. It was the headquarters of the Huguenot rebellion of 1621, and was mainly besieged by Louis XIII. for eighty-six days; nor did it submit until the fall of La Rochelle in 1629, when its fortifications were destroyed by Richelieu. In the same year the plague cut off over 6000 of its inhabitants. The Protestants again suffered persecution after the repeal of the Edict of Nantes.

MONTAUBAN, CHARLES DE SAINTE-MAURE, DUC DE (1610-1690), French soldier, was born on 6th of October 1610, being the second son of Léon de Sainte-Maure, baron de Montauban. His parents were Huguenots, and he was educated at the Protestant College of Sedan under Pierre du Moulin. He served brilliantly at the siege of Casale in 1630. Becoming marquis de Montauban by the death of his elder brother in 1635, he was the recognized aspirant for the hand of Mme de Rambouillet's daughter Julie Lucine d'Angennes (1607-1671). Having served under Bernard of Saxe-Weimar in Germany in 1634 he returned to the French service in 1636, and fought in the Rhenish campaigns of the following years. He was taken prisoner at Rantzau in November 1643, and only ransomed after ten months' captivity. On his return to France he was made a lieutenant-general. On the 15th of July 1643 he married "the incomparable Julie," thus terminating a courtship famous in the annals of French literature because of the Guirlande de Julie, a Garland of verse consisting of madrigals by Montausier, Jean Chapelain, Guillaume Collet, Claude de
MONTBÉLIARD—MONTCALM DE SAINT VÉRAN

Mallevalle, Georges de Scudéry, Pierre Cornelle (if M. Uzanne is correct in the attribution of the poems signed M.C.), Philippe Hubert, Simon Arnaud de Pomponne,1 Jean Desmares de Saint Soral, Antoine Gombaud (le nain de la Princesse Julie) and others. It was copied by the famous calligraphist N. Jarry in a magnificent MS, on each page of which was a painted flower, and was presented to the Duke of Luxembourg.

The MS, is now in possession of the Uzès family, to whom it passed by the marriage of Julie's daughter to Emmanuel de Crussol, duc d'Uzès.

Montausier had bought the governorship of Saintonge and Angoumois, and became a Roman Catholic before his marriage. During the Fronde he remained in spite of personal grievances against Mazarin, faithful to the Crown. On the conclusion of peace in 1653 the marquis, who had been severely wounded in 1652, obtained high favour at court in spite of the roughness of his manners and the general austerity which made the Parisian public recognize him as the original of Alceste in the Misanthrope. Montausier received from Louis XIV. the order of the Saint Esprit, the government of Normandy, a dukedom, and in 1668 the office of governor of the dauphin, Louis. He initiated the series of classic comedies (ces comedies de l'admirable), directed by the learned Huet, and was the chief adviser in the education of his charge, who was only moved by his iron discipline to a hatred of learning. Court gossip assigned some part of Montausier's favour to the complaisance of his wife, who, appointed lady-in-waiting to the queen in 1664, favoured Louis XIV.'s passion for Louise de la Vallière, and subsequently protected Mme de Montespan, who found a refuge from her husband with her. He died on the 17th of November 1690.

See Pierre Nicolas Petit, Vie du duc de Montausier (1779); Puget de Saint Pierre, Histoire du duc de Montausier (1782); Amédé Roux, Un Misanthrope à la cour de Louis XIV. (1806); O. Uzanne, La Guirlande de Julie (1875); E. Fichet, Oraison funèbres du duc et de la duchesse de Montaubier (Paris, 1891); and contemporary memoirs.

MONTBÉLIARD, a town of eastern France, capital of an arrondissement in the department of Doubs, 49 m. N.E. of Besançon on the Paris–Lyons line between that town and Belfort. Pop. (1906), town, 8723; commune, 10,455. Montbéliard is situated 1050 ft. above sea-level on the right bank of the Allaine at its junction with the Luxine (Lizaine or Lizaine). It is an important point in the frontier defences of France since 1871. Forts on outlying hills connect it with Belfort on the one side and (through Blamont and the Lomont fortifications) with Besançon on the other. The old castle of the counts of Montbéliard is now used as barracks; its most conspicuous features, the Tour Bossue and the Tour Neuve, date respectively from 1425 and 1594. Most of the inhabitants are Protestant, and the church of St Martin, built early in the 17th century, now serves as a Protestant place of worship. The old market-hall and some old houses of the 16th century also remain. A bronze statue of George Cuvier, the most illustrious native of Montbéliard, and several fountains adorn the town. Montbéliard is the seat of a sub-prefecture and has a tribunal of first instance, a board of trade-arbitrators, a communal college, a practical school of industry, a chamber of arts and manufactures and a museum of natural history. Since 1870 a considerable impetus has been given to its prosperity by the Alsatian immigrants. Its industries include watch and clock making and dependent trades, cotton spinning and weaving, the manufacture of hosiery, textile machinery, tools, nails and wire, and brewing. There is commerce in wine, cheese, wood and Montbéliard cattle.

After belonging to the Burgundians and Franks, Montbéliard (Mons Pelugard) was, by the treaty of Verdun (843), added to Lorraine. In the 11th century it became the capital of a counts-ship, which formed part of the second kingdom of Burgundy and latterly of the German Empire. Its German name is Mönchbachi. The town passed by marriage to the house of Württemberg, to whom it belonged till 1793. It resisted the attacks of Charles the Bold (1473), and Henry I. of Lorraine, (1587 and 1588), duke of Guise, but was taken in 1676 by Marshal Luxembourg, who razed its fortifications. The tolerance of the princes of Württemberg attracted to the town at the end of the 17th century a colony of Anabaptists from Frisia, and their descendants still form a separate community in the neighbourhood.

In 1793 the inhabitants voluntarily submitted to annexation to France. In 1871 the battle of the Lissaine between the French and Germans was fought in the neighbourhood and partly within its walls.

MONTBRISON, a town of central France, capital of an arrondissement in the department of Loire, France, 21 m. N.W. of St Étienne, on the railway from Clermont to St Étienne. Pop. (1906), 6564. It is situated on a volcanic hill overlooking the Vizey, a right-hand affluent of the Lignon du Nord. The principal buildings are the once collegiate church of Notre-Dame d'Espérance, founded about 1220 but not finished till the 17th century, and the 14th-century edifice known as the Salle de la Diana (Decana), which was restored by Viollet-le-Duc.

There is a statue of the poet Victor de Laprade (d. 1883), a native of the town. Montbrison is the seat of a sub-prefecture, of a court of assize and of a tribunal of first instance. There are liqueur-distilleries and flour-mills, and silk ribbons are manufactured; there is considerable trade in fruit.

Montbrison belonged to the counts of Forez during the middle ages. In 1801 it became the capital of its department in place of Furs, but in 1856 the more important town of St. Étienne was substituted for it.

MONTBRUN, LOUIS PIERRE, COUNT (1770–1812), French cavalry general, served with great distinction in the cavalry arm throughout the wars of the Revolution and the Consulate, and in 1800 was appointed to command his regiment, having served therein from trooper upwards. At Austerlitz (Dec. 2, 1805) he was promoted general of brigade. He earned further distinction in Germany and Poland as a dashing leader of horse, and in 1808 he was sent into Spain. Here occurred an incident which unfavourably influenced his whole career. He found himself obliged to overstay his leave of absence in order to protect the lady who afterwards became his wife. Napoleon was furious, and deprived him of his command, and Montbrun was awaiting his master's decision when an opportunity came to retrieve his reputation. Some doubt exists as to the events of the famous cavalry charge at the Somosierra, but Montbrun's share in it was most conspicuous. Soon afterwards he was promoted to be general of division, and in 1809 his cavalry took no inconsiderable part in the victories of Eckmühl and Raab. He was employed in the Peninsula, 1810–1811. He was killed, when commanding a cavalry corps, at the beginning of the battle of Borodino (Sept. 7, 1812). Montbrun was considered, as a leader of heavy cavalry, second only to Kellermann of all the generals of the First Empire.

MONTCALM DE SAINT VÉRAN, LOUIS JOSEPH, MARQUIS DE (1712–1759), French soldier, was born at Condac near Nîmes on the 28th of February 1712;2 and entered the army in 1721, becoming captain in 1727. He saw active service under Berwick on the Rhine in 1733, and in 1743, having become a colonel of infantry, he served in Bohemia under Maillebois, Broglie and Belleisle. He became intimate with François de Chevert (1693–1760), the gallant defender of Prague, and in Italy repeatedly distinguished himself, being promoted brigadier in 1747, shortly after the disastrous action of Exilles, in which he was severely wounded. In 1749 he received the colonelcy of a cavalry regiment, and in 1756, with the rank of maréchal de camp, he was sent to command the French troops in Canada. In the third year of his command, he had been meanwhile promoted lieutenant-general, he defended Quebec (q.v.) against General Wolfe. The celebrated siege ended with the battle

2 A younger brother, Jean Louis Pierre (or Philippe) Elizabeth Moncalm de Condac (1719–1726), was a child of astonishing precocity. At the age of four he read Latin; at six he understood Greek and Hebrew. It was for his benefit that the bureau typographique—a mechanism for teaching children reading, writing and arithmetic at the same time that it amused them—was contrived by their tutor Louis Dumas (1676–1744).
of the Heights of Abraham (Sept. 12, 1759), in which Wolfe was killed and Montcalm mortally wounded. The French commander died two days later, while the place, with which his name and Wolfe's are for ever associated, was still in the hands of the garrison.

Bibliography.—See Canada: History; and Seven Years' War, also Parkman's "Montcalm and Wolfe." The chief French authorities are Pierre d'Harcourt, Histoire du siecle de Louis XIV (1829); Histoire de la France en cent ans, v. 616 (1762); Montcalm et le Canada français, by F. Jouleau (Paris, 1874) and C. de Bonnechose (Paris, 1877); Le Moine, La Mémoire de Montcalm vengé (Montreal, 1886).

MONTCEAU-LES-MINES, a town of east-central France, in the department of Saône-et-Loire, 14 m. S. by W. of the Le Creusot on the Paris-Lyon railway. Pop. (1906), 79,071; commune, 26,305. Its importance is due chiefly to its position as the centre of the Blanzy coal basin, on the Canal du Centre, which is connected with the coalfield by numerous lines of railway. Its manufacturing establishments include weaving and spinning factories, iron and copper foundries, and engineering workshops.

MONT CENIS, a pass (6935 ft.) in Savoy (France) which forms the limit between the Cottian and Granal Alps. A carriage road was built across it between 1803 and 1810 by Napoleon, while a light railway (named after its inventors, M. Tell, and the engineer of the English "engine-drivers") was opened alongside the road in 1868, but was destroyed in 1871, on the opening of the tunnel. This tunnel (highest point 4249 ft.) is really 15 m. west of the pass, below the Col de Fréjus. From Chambéry the line runs up the Isère valley, but soon bears through that of the Arc or the Maurienne past St Jean de Maurienne to Modane (61 m. from Chambéry). The tunnel is 8 m. in length, and leads to Bardonnèche, some way below which, at Oulx (18 m. from Modane) the line joins the road from the Mont Genèvre. Thence the valley of the Dora Riparia is followed to Turin (643 m. from Modane). The carriage road mounts the Arc valley for 16 m. from Modane to Lanellebourg, whence it is 8 m. to the hospice, a little way beyond the summit of the pass. The descent lies through the Cenis valley to Susa (37 m. from Modane) where the road joins the railway. To the south-west of the Mont Cenis is the Little Mont Cenis (7166 ft.) which leads from the summit plateau (in Italy) of the main pass to the Étache valley on the French slope and so to Bramans in the Arc valley (7 m. above Modane). This pass was crossed in 1689 by the Vaudois, and by some authors is believed to have been "the only gap in the Alps." (W. A. B. C.)

MONTCHRÉTIEN, ANTOINE DE (1575 or 1576-1621), French dramatist and economist, son of an apothecary at Falaise named Mauchretein, was born about 1576. In one of his numerous duels he had the misfortune to kill his opponent. He consequently took refuge in England, but through the influence of James I., to whom he dedicated his tragedy, L'Écossaise, he was allowed to return to France, and established himself at Auxonne-sur-Loire, where he set up a steel foundry. In 1621 he abandoned this enterprise to serve on the Huguenot side in the civil wars. He raised troops in Maine and Lower Normandy, but was killed in a skirmish near Tournai on the 8th of October 1621. There is no evidence that he shared the religious opinions of the party for which he fought, and in any case he belonged to the moderate party rallied around Henry IV. In 1615 he published a valuable Traité de l'économie politique, based chiefly on the works of Jean Bodin. He had the good fortune to write before the pruning processes of Vaugelas and Balzac had been applied to the language, and M. Lanson praises him as one of the best prose-writers of his time, if his dramas are Saphonisia (1596) afterwards remodelled as La Cartogánoise; L'Écossaise, Les Lascènes, David, Aman (in 1601); Hector (1604). As plays they have little technical merit, but they contain passages of great lyrical beauty. In L'Écossaise Elizabeth first pardons Mary Queen of Scots, and no explanation is given of the change that leads her to execute her. Aman has been compared not too unfavourably with Esther, and the hatred of Haman for Mordecai is expressed with more vigour than in Racine's play. All Montchrétien's heroes face death without fear. M. Petit de Julleville finds the characteristic note of his plays in the same cult of heroism which was later to inspire the plays of Corneille. Poet, economist, ironmaster, and soldier, Montchrétien represents the many-sided activity of a time before literature had become a profession, and before its province had been restricted in France to polite topics.

The tragedies were edited in 1901 by M. Petit de Julleville with notice and commentary; the Traité de l'économie politique in 1889 by Th. Funck Brentano, whose estimate of Montchrétien is severely criticized by W. K. H. Hele in the English Rev. (Oct. 1891). See also Émile Figuet, L'Écossaise et l'Écossais au XVIIe siècle, ch. xi. (1883); G. Lanson, Revue des deux mondes (Sept. 1891).

MONTCLAIR, a town of Essex county, New Jersey, U.S.A., 5 m. N.W. of Newark. Pop. (1910 census) 21,550. It is served by the Erie and the Delaware, Lackawanna & Western railways, and by electric lines to Caldwell and Newark. It is situated at the base and on the slopes of the Orange Mountains (its altitude above the sea varying from 217 to about 665 ft.), has an irregular street plan, and is a residential suburb of New York and other neighbouring cities. Montclair has excellent public schools. Among the town's institutions are the Mountainside hospital, a state normal school (1908), Montclair academy (1887), a public library, and two orphan asylums. An annual Bach festival was first held here in June 1905. The lower part of Montclair was settled about 1675 and gradually became known as Crantown, which name it retained until 1812. In that year Bloomfield, including Crantown, was incorporated as Montclair. Montclair became a town in 1894.

MONT-DE-MARSAN, a town of south-west France, capital of the department of Landes at the confluence of the Midou and the Douze, 92 m. S. of Bordeaux on the Southern railway between Morcenx and Tarbes. Pop. (1906), 10,059. Most of the buildings are in the older quarter, on the peninsula between the two rivers forming the Midouze. La Pépière, a beautiful public garden, extends along the right bank of the Douze. A keep of the 14th century, now used for military purposes, was built by Gaston Phoebus, count of Foix, to overawe the inhabitants, and to guard the name of New Bordeaux "Thou ne veux pas." The finest of the modern buildings is an officers' club, which contains a small museum. A court of assizes sits in the town; the local institutions comprise a tribunal of first instance, a branch of the Bank of France, and a lycée.

The industries include distillation of turbine and resinous oils, tanning, the founding and forging of metal, wood-sawing, and manufactures of machinery and straw envelopes for bottles. There is trade in resin, wine, brandy, timber, cattle, horses and other live stock.

Mont-de-Marsan, the first of the Bastides (g.v.) of the middle ages, dates from 1141, when it was founded by Pierre, vicomte de Marsan, as the capital of his territory. In the 15th century it passed to the viscounts of Béarn, but the harsh rule of Gaston Phoebus and some of his successors induced the people to favour the English. The territory was united to the French Crown on the accession of Henry IV.

MONTDIDIER, a town of northern France, capital of an arrondissement in the department of Somme, 23 m. S.E. of Amiens by rail. Pop. (1906), 4759. The town, site of a great remonstrance on the right of the town of Ron, is an ancient episcopal see of the Merovingian period, and perhaps owes its name to the imprisonment of the Lombard king Didier in the 8th century. The church of St Peter, dating chiefly from the 15th century, has a beautiful portal of the 16th century and contains the tomb of Raoul III., count of Crépy (10th century), fonts of the 11th century and other works of art. The church of St Sépulcre belongs, with the exception of the modern portal, to the 15th and 16th centuries. In the interior there is a well-known "Holy Sepulchre" of the
latter period. The law-court, once the castle, partly dating from the 12th century, possesses fine tapestries of the 17th century. A statue commemorates the birth at Montdidier of Antoine Parmentier (1737-1813), with whose name are connected the beginnings of potato-culture in France. The town has a sub-prefecture and a tribunal of first instance; its industries include tanning and the manufacture of zinc-white.

Held first by its own lords, afterwards by the counts of Crépy and Valois, Montdidier passed to the Crown in the 12th century, at the end of which it was granted a charter of liberties. The town offered a brave and successful resistance to the Spanish troops in 1636.

**MONTE-DORE-LES-BAINS**, a watering-place of central France in the department of Puy-de-Dôme, situated at a height of 3440 ft., on the right bank of the Dordogne not far from its source, and 31 m. by road S.W. of Clermont-Ferrand. Pop. (1906), 1677. The Monts Dore close the valley towards the south. The thermal springs of Mont Dore, now numbering twelve, were known to the Romans. Bicarbonate of soda, iron and arsenic are the principal ingredients of the waters, which are used both for drinking and bathing, baths of high temperature being accordingly recommended. The springs also attract treaters suffering from pulmonary consumption, bronchitis, asthma, and nervous and rheumatic paralysis. From the elevation and exposure of the valley, the climate of Mont-Dore-les-Bains is severe, and the season only lasts from the 15th of June to the 15th of September. The bath-house was rebuilt in 1891-1894. In the “park,” along the Dore, relics from the old Roman baths have been collected. The surrounding country, with its fir woods, pastures, waterfalls and mountains, is very attractive. To the south is the Puy de Sancy (6188 ft.), the loftiest peak of central France.

**MONTEAGLE, THOMAS SPRING-RICE, 1st Baron (1750-1866),** English statesman, son of S. E. Rice and Catherine Spring, came of a Limerick family, whose ancestor was Sir Stephen Rice (1637-1715), chief baron of the Irish exchequer and a leading Jacobite. In 1820 he became Whig member for Limerick (from 1832 member for Cambridge); and after holding minor offices became secretary for war and the colonies in 1834 and in 1835-1839 chancellor of the exchequer. He was disappointed in not obtaining the speakership, but in 1836 he was created Baron Monteagle of Brandon (a title intended earlier for his ancestor Sir Stephen Rice), and made controller of the exchequer. He differed from the government as regards the exchequer control over the treasury, and the abolition of the old exchequer (q.v.) was already determined upon when he died on the 7th of February 1866. His eldest son, Stephen Edmund Spring-Rice (1814-1865), deputy chairman of the board of customs, having predeceased him, he was succeeded in the title by his grandson, Thomas, 2nd baron (b. 1840). Another son was father of S. E. Spring-Rice (1856-1902), of the treasury, and of Sir Cecil A. Spring-Rice (b. 1859), the diplomatist.

**MONTEAGLE, WILLIAM PARKER, 4th Baron, and 11th Baron Morley (1755-1822),** was the eldest son of Edward Parker, 3rd Baron Morley (d. 1818), and of Elizabeth, daughter and heiress of William Stanley, 3rd Baron Montagu (d. 1819). When quite a youth he married Elizabeth, daughter of Sir Thomas Tresham, and was styled Lord Montague in right of his mother, who was descended with many Roman Catholic families, and during the reign of Elizabeth was in sympathy with their cause. He received knighthood when with Essex in Ireland in 1599, and in 1601 took part in the latter's rebellion in London, when he was punished by imprisonment and a fine of £800. He subsequently in 1602 joined in sending the mission to Spain inviting Philip III. to invade England. He was intimate with Catesby and others, and according to Father Garnet expressed an opinion some few months before gunpowder plot that the Romanists had a good opportunity of making good their claims by taking up arms against the king. It is certain that he was one of those who acquainted James I.'s accession and assisted Southampton in securing the Tower for the king. He was taken into favour, and received a summons to attend the parlia-

ment of the 8th of November 1605 as Lord Monteagle. On the 26th of October 1605, while sitting at supper at Hoxton, he received the celebrated letter giving warning of the gunpowder plot, probably written by Francis Tresham. After having caused it to be read aloud by Ward, a gentleman in his service and an intimate friend of Winter, one of the chief conspirators, he took it to Whitehall and showed it to Lord Salisbury and other ministers. On the 4th of November he accompanied Lord Suffolk, the lord chamberlain, in his visit to the vault under the parliament house, where Guy Fawkes was found. Monteagle received £700 a year for his services in averting the disaster. In 1609 he was chosen a member of the council of the Virginia Company and subscribed to its funds. The same year "disorders in his house" are reported, probably referring to his harbouring of Roman Catholic students from St Omer (Cal. of St Pab: Dom: 1603-1610, p. 533). In 1618, on the death of his father, he was summoned to parliament as Baron Morley and Monteagle. He died on the 1st of July 1622 at Great Halingdon, Essex, where he was buried. By his marriage with Elizabeth Tresham he had, besides daughters, three sons, the eldest of whom, Henry, (d. 1653) succeeded him as 12th Baron Morley. He was known as Monteagle of Brandon, but his titles were blazoned Monteagle of Monteagle and of Dore. The batonies fell into abeyance when Henry's son Thomas died without issue in 1681.

**MONTE CASSINO,** an isolated hill overhanging the town of Cassinum, about midway between Rome and Naples. Hither St Benedict migrated from Subiaco in the early years of the 6th century, and established the monastery that became the metropolis of Western monachism. About 580-590 it was sacked by the Lombards, and the monks fled to Rome, where they were established at the Lateran basilica. The monastery was rebuilt in 720, again destroyed by the Saracens in 884, and restored seventy years later. It reached its highest point of prosperity and influence from 1059 to 1105, under Desiderius (who became Pope Victor III. in 1087) and Oderusius. The abbey became overlord of an extensive territory and bishop of several dioceses: now, though not a bishop, he is ordinary of seven dioceses. At the dissolution of monasteries in 1866 Monte Cassino was spared, owing mainly to a reminiscence by English well-wishers of United Italy. The monastery became a national monument and the monks were recognized as custodians. There is a large school for the children of 250 houses and rich archives. The monks are served by a community of Benedictines.

See L. Telesio, Storia della badia di M.C. (1814; 2nd ed., 1888); Wetzler u. Wette, Kirchenlexicon (2nd ed.) and Herzog, Realencyclo-
pädie (3rd ed.).

**MONTECATINI,** two much-frequented mineral baths of Tuscany, Italy. (1) Montecatini in Val di Cecina, in the province of Pisa, 3 m. W. of Volterra. Pop. (1901), 5009. The water is saline, with a temperature of 78-88° F. There are copper mines, which have been worked since the 15th century, 1385 ft. above sea-level. (2) Montecatini in Val di Nievole, in the province of Lucca, 7 m. W. by S. of Pistoja, 105 ft. above sea-level. Pop. (1901), 3048 (Bagni di Montecatini); 2856 (Montecatini). The springs, which number ten, are saline, and range in temperature from 82-4°F. to 86°F. The water is both drunk and used for bathing by some 40,000 visitors annually, and is exported in bottles. There is also a natural vapour bath (86°-95°F.) in the Grotta Giusti (so-called from the satirist Giuseppe Giusti, a native of the place), at Monsummano near Lucca, 6 m. from Pistoia. An attraction of the place is the gardens of Collodi. At the town of Montecatini, on the hill above (951 ft.), the Florentines were defeated by Uguzzoni della Fagguiola of Pisa in 1315.

**MONTE CORVINO, GIOVANNI DI** (c. 1247-1328), Franciscan missionary, traveller and statesman, founder of the earliest Roman Catholic missions in India and China, and archbishop of Peking. In 1272 he was commissioned by the emperor Michael Palaeologus, to Pope Gregory X., to negotiate for the reunion of Greek and Latin churches. From 1275 to 1280 he laboured incessantly as a missionary in the Nearer and Middle East. In 1289 he revisited the Papal Court, and was sent out as Roman legate to the Great Khan, the Ilkhans of Persia, and other leading personages of the Mongol world, as well as to the
"emperor of Ethiopia" or Abyssinian Negus. Arriving at Tabriz, then the chief city of Mongol Persia, and indeed of all Western Asia, Montecuccio moved down to India to the Madras region or "Country of St Thomas," from which he wrote home, in December 1391 (or 1392), the earliest account of the Coromandel coast written by any Western European. He next appears in "Cambalache" or Peking, and wrote letters (of Jan 8, 1305, and Feb. 13, 1306), describing the progress of the Roman mission in the Far East, in spite of Nestorian opposition; alluding to the Roman Catholic community he had founded in India, and to an appeal he had received to preach in "Ethiopia" and dealing with overland and oversea routes to "Cathay," from the Black Sea and the Persian Gulf respectively. In 1303 he received his first colleague, the Franciscan Arnold of Cologne; in 1307 Pope Clement V. created him archbishop of Peking, and despatched seven bishops to consecrate and assist him; three only of these arrived (1308). Three more suffragans were sent out in 1312, of whom one at least reached East Asia. A Franciscan tradition maintains that about 1310 Mont Corvino converted the Great Khan (i.e. Khai-Shan Kuluk, third of the Yuan dynasty; 1307-1311): this has been disputed, but he unquestionably won remarkable successes in North and East China. Besides three mission stations in Peking, he established one near the present Amoy harbour, opposite Formosa. At his death in 1338, heathen vied with Christian in honouring him. He was apparently the only effective Jesuit in the Peking of the middle ages.

The MSS. of Mont Corvino's Letters exist in the Laurentian Library, Florence (for the Indian Epistle) and in the National Library, Paris, 5006 Lat.—viz. the Liber de aetatis, folios. 170, v.-172, r. (for the Chinese). They are printed in Wadding, Annales minorum provinciae (1638 and 1639, ed. of 1705), and in the Münchener gelehrte Anzeigen (1855), No. 22, part iii. pp. 171-175. English translations, with valuable comments, are in Sir H. Yule's Cathay, i. 197-221. See also Wadding, Annales, v. 1597, 190-208; B. R. M. Sim, 157, 147, etc., 176, 177, 200-210; Sir H. Yule, Cathay, i. 165-173. (C. R. B.)

MONTECRISTO, (anc. Oglasa), an island of Italy, belonging to the province of Leghorn, 25 m. S. of Elba. Its highest point is 2126 ft. above sea-level, and its area about 6 sq. m. It contains the ruins of a Camaldulensian monastery, founded in the 13th century and destroyed in the 16th, and is the private property of the king of Italy, who has a shooting-lodge there. The fame of the island is due to the novel, Le Comte de Monte-Cristo, by theelder Dumas.

MONTECUCCILI (Montecuccili), RAIMONDO, COUNT of (1609-1680), prince of the holy Roman Empire and Neapolitan duke of Meli, Austrian general, was born on the 21st of February 1608/9, at the castle of Montecuccili in modern Italy. His family was of Burgundian origin and had settled in north Italy in the 10th century. At the age of sixteen Montecuccili was made a private soldier under his uncle, Giambattista Montecuccili, a distinguished Austrian general (d. 1633). Four years later, after much service in Germany and the Low Countries, he became a captain of infantry. He was severely wounded at the storming of New Brandenburg, and again in the same year (1631) at the first battle of Breitenfeld, where he fell into the hands of the Swedes. He was again wounded at Lützen in 1632, and on his recovery was made a major in his uncle's regiment. Shortly afterwards he became a lieutenant-colonel of cavalry. He did good service at the first battle of Nördlingen (1634), and at the storming of Kaiserslautern in the following year won his colonelcy by a feat of arms of unusual brilliance, a charge through the breach at the head of his heavy cavalry. He fought in Pomerania, Bohemia and Saxony (surprise of Wolmirstadt, battles of Wittstock and Chemnitz), and in 1639 he was taken prisoner at Melnik and detained for two and a half years in Stettin and Weimar. In captivity he studied, not only military science, but also geometry in Euclid, history in Tacitus, and architecture in Vitruvius, and planned his great work on war. On his release he distinguished himself again in Silesia. In 1643 he went to Italy, by the emperor's request, and made a successful campaign in Lombardy. On his return to Germany he was promoted lieutenant-field-marshall and obtained a seat in the council of war. In 1645-46 he served in Hungary against Prince Rakoczy of Transylvania, on the Danube and Neckar against the French, and in Silesia and Bohemia against the Swedes.

The victory of Triebel in Silesia won him the title of supernumery general of cavalry, and at the battle of Zunsmarhausen in 1648 his stubborn rearguard fighting rescued the imperialists from annihilation. For some years after the peace of Westphalia Montecuccili was chiefly concerned with the business of the council of war, though he went to Flanders and England as the representative of the emperor, and to Sweden as the envoy of the pope to Queen Christina, and at Modena his lance was victorious in a great tourney. In 1657, soon after his marriage with Countess Margarethe Dietrichstein, he took part in, and after a time commanded, an expedition against Rakoczy and the Swedes who had attacked the king of Poland. He became field-marshall in the imperial army, and with the Great Elector of Brandenburg completely defeated Rakoczy and his allies (peace of Oliva, 1660). From 1661 to 1664 Montecuccili with inferior numbers defended Austria against the Turks; but at St Gotthard Abbey, on the Raab, he defeated the Turks so completely that they made a truce for twenty years (Aug. 1, 1664). He was given the title of Vizekönig, and the command of the Austrian troops in Poland, and director of artillery. He also devoted much time to the compilation of his various works on military history and science. He opposed the progress of the French arms under Louis XIV., and when the inevitable war broke out received command of the imperial forces. In the campaign of 1673 he completely out-manoeuvred his great rival Turenne on the Neckar and the Rhine, and secured the capture of Bonn and the junction of his own army with that of the prince of Orange on the lower Rhine. He retired from the army when, in 1674, the Great Elector was appointed to command in chief, but the brilliant successes of Turenne in the winter of 1674 and 1675 brought him back. For months the two famous commanders manoeuvred against each other in the Rhine valley, but on the eve of a decisive battle Turenne was killed and Montecuccili promptly invaded Alsace, where he engaged in a war of manoeuvre with the great Condé. The siege of Philippsburg was Montecuccili's last achievement in war. The rest of his life was spent in military administration and literary and scientific work at Vienna. In 1672, and the German Kriegsnachrichten des Fürsten Raimundi Montecuccoli at Leipzig in 1736. Of this work there are MSS. in various libraries, and many memoirs on military history, tactics, fortifications, etc., by his friends, L. E. R. Schenkel, and L. von Schenkel, and others, unedited in the archives of Vienna. The collected Opere di Raimondo Montecuccoli were published at Milan (1807), Turin (1821) and Venice (1840), and include political essays and poetry. Specifications, Raimondo conte di Montecuccoli, by W. Spenholtz, Aureum tellus seu catena, &c. (Vienna, 1668); memoir prefixed to the Memorie (Cologne edition); this appears also in v. der Groeben's Neuer Kriegs-bibliothek, vii. 230 (Breslau, 1777); Morgenstern, Oesterreichs Helden (St. Pölten, 1782); Schenkel, Geschichte der künftigen kurze Eichow (Leipzig, 1753); F. Illiger, Elie storico del conte Raimondo Montecuccoli (Modena, 1776); Schels, Oesterreichische militärische Zeitschrift (Vienna, 1818, 1828 and 1842); Poelz, Lebensbeschreibung Montecuccolis (Vienna, 1792); Harnay, Oesterreichs Fluchtkehr, XIII. (Vienna, 1808); Reilly, Biographie der berühmtesten Fürsten Oesterreichs (Vienna, 1813); Würzbach, Biographisches Lexikon des Kaiserthums, &c., pt. 19 (Vienna, 1869); Teuffenbach, Vaterländisches Ehrenbuch (Vienna and Teschen, 1877); Die Hofgeheilsgeschichte, präsidienten (Vienna, 1874); Weingartner, Heldenbuch (Teschen, 1882); Grossmann, Archiv für öst. Geschichte (Vienna, 1878); also
supplement to Militär. Wochenblatt (Berlin, 1878); Organ des militär-wissenschaftl. Vereins (Vienna, 1881); Reale institute veneto di scienze, vili. 5, 6 (Venice, 1881); Rivista militare Italiana (March and April 1882); Allgemeine deutsche Biographie, vol. xxii. (Leipzig, 1886).

Important controversial works are by those of Turpin and Warnery, two distinguished soldiers of the 18th century (Commentaires sur les mémoires, &c. (Paris), 1769, and Commentaires sur les comm. . . du comte Turpin, Breslau, 1777). A critical estimate of Montefiore was also by Dr. Gesch. Der Kriegswissenschaften, ii. 1162-1178 (Leipzig, 1890).

MONTEFALCO—MONTEIL

MONTEFALCO, a town of the province of Perugia, Italy, 6 m. S.W. of Foligno, situated on a hill, 1550 ft. above sea-level. Pop. (1901), 3397 (town); 5726 (commune). Its churches contain a number of pictures of the Umbrian school; S. Francesco has good frescoes (scenes from the life of S. Francis) of 1452, by Benozzo Gozzoli, in the choir. There is also a communal picture-gallery in the picturesque Palezzo Comunale.

MONTEFASCON, a town and episcopal see of the province of Rome, Italy, built on a hill (2077 ft.) on the S.E. side of the Lake of Bolsena, 70 m. by rail N.W. of Rome. Pop. (1901), 3041 (town); 9721 (commune). The cathedral (1516) is one of the earliest structures by Sannicchelli, S. Maria della Grazie is also by him. The town has in San Filavano (built in 1322, repaired and enlarged in the Gothic style late in the 14th century), a curious double church of importance in the history of architecture (cf. G. T. Rivolf, Origini dell'architettura lombarda, i. 352 sqq.); in its interior some 14th century frescoes were discovered in 1866. In the crypt is the grave of a traveller, who succumbed to excessive drinking of the local wine known as Est, est, est. The story is that his valet who preceded him wrote "est" on the doors of all the inns where good wine was to be had, and here the inscription was thrice repeated. It is possible that Montefascone occupies the site of the Fanum Vultumae, at which the representatives of the twelve chief cities of Eturia met in the days of their independence; while under the Empire the festival was held near Volsinii.

MONTEFIORE, SIR MOSES HAIM (1784-1885), Jewish philanthropist, eldest son of Joseph Elias Montefiore, a London merchant, and of Rachel, daughter of Abraham Lumbrosio de Mattos Mocatta, was born at Leghorn, of those of Turpin and Leghorn. His paternal ancestors were Jewish merchants who settled at Ancona and Leghorn in the 17th century, whilst his grandfather, Moses Haim Montefiore, emigrated from the latter town to London in 1758. Montefiore entered the Stock Exchange, his uncle purchasing him for a cost of £1200 the right to practise as one of the twelve Jewish brokers licensed by the city of London. Although belonging to the Sephardic or "Spanish" congregation of Jews, he married in 1812 Judith, a daughter of Levi Barent Cohen, of the "German" Jews, another of whose daughters was the wife of Nathan Mayer Rothschild, the head of the great banking firm; this relationship led to a close connexion in business between Montefiore and that house, and his brother Abraham married Henrietta Rothschild, a sister of the financier. In 1824 Montefiore, having amassed a fortune, retired from the Stock Exchange. From his forty-three year Montefiore devoted all his energies to ameliorating the lot of his co-religionists in Palestine and in England; in 1827, he undertook, and in 1829, resulted in a friendship with Mehemet Ali which was to lead to much practical good. Immediately on his return, Montefiore began to take an active part in the struggle which British Jews were then carrying on to obtain full political and civic rights. In 1837 he became the city of London's second Jewish sheriff, and was knighted. In 1838, accompanied by Lady Montefiore, he started on a second voyage to Palestine, in order to submit to Mehemet Ali a scheme for Jewish colonization in Syria. Though political disturbances rendered his efforts again unsuccessful, the year 1840 brought Montefiore once more before Mehemet, this time to plead the cause of some Jews imprisoned at Damascus on a charge of ritual murder. He obtained their release, and on his way back wrung from the government a decree granting Jews throughout Turkey the utmost privileges accorded to aliens. In 1846 the threatened re-issue in Russia of an Imperial ukase (first promulgated in 1844) ordering the withdrawal of all Jews from within 50 versts of the German and Austrian frontiers, caused Montefiore to proceed to St. Petersburg, where in an interview with the tsar he succeeded in getting the ukase rescinded. On his return, Queen Victoria, on the recommendation of Sir Robert Peel, made him a baronet. In 1859 a case of injustice which attracted the attention of all Europe brought Sir Moses to the gates of the Vatican. A Jewish child named Mortara had been secretly baptized by its nurse and stolen from its mother, who died of grief. Cardinal Antonelli, in the name of the pope, refused to give up the boy, who became a priest. In 1863 we find Montefiore on a mission in Constantinople to obtain from the Sultan, Abdul Aziz, the confirmation of his predecessor's decrees in favour of the Jews; in 1864 in Morocco to combat an outbreak of anti-Semitism; in 1866 in Syria, relieving the distress resulting from a plague of locusts and an epidemic of cholera; and in 1867 in Rumania, once more pleading the cause of the oppressed Jews with Prince Charles. In 1872 Montefiore was deputed by the British Jews to present to Alexander II. their congratulations on the bicentenary of the birth of Peter the Great, and was received by the tsar with great honour at the Winter Palace. His seventh and last pilgrimage to the Holy Land was made in 1875, of which he wrote an account in his Narrative of a Forty Days' Visit to the Holy Land, published in that year. The last decade of his life was passed in comparative quiet upon his estate near Ramsgate, in Kent; and there, after having received general congratulations on the completion of his hundredth year, he passed peacefully away on the 28th of July 1885. Sir Moses Montefiore was a strictly orthodox Jew, scrupulously observant of both the spirit and the letter of the Scriptures; in his grounds he had a synagogue built where services are still held twice a year, a college where ten rabbis live and expound the Jewish law, and a mausoleum that contains the remains of himself and of Lady Montefiore, who died in 1862.

MONTEFRIO, a town of southern Spain, in the province of Granada, on the river Bilano. Pop. (1900), 10,725. Montefrío is largely Moorish in character, and dominated by a Moorish castle. Being built midway between the Sierra de Priego and the Sierra Parapar, and commanding the open valley between these ranges, it became one of the chief frontier fortresses of the Moors in the 15th century. Its industries include manufactures of cotton stuffs, alcohol and soap.

MONÉGUT, JEAN BAPTISTE JOSEPH ÉMILE (1825-1895). French critic, was born at Limoges on the 14th of June 1825. He began to write for the Revue des deux mondes in 1847, contributing between 1851 and 1857 a series of articles on the English and American novel, and in 1857 he became chief literary critic of the review. Émile Monét translated Essais de philosophie américaine (1850) from Emerson; Révolution de 1848 (2 vols. 1853) from Macaulay's History; and also produced the Œuvres complètes (10 vols. 1868-1873) of Shakespeare. Among his numerous critical works are Écritures modernes d'Angleterre (3rd series, 1885-1892) and Heures de lecture d'un critique (1891), studies of John Aubrey, Pope, Wilkie Collins and Sir John Mandeville. Monét died in Paris on the 11th of December 1895.

MOINEIL, AMANS ALEXIS (1760-1850). French historian, was born at Rodez in 1760, and died at Cely (Seine-ET-Marne) in 1850. His tastes were historical, and he taught history at Rodez, at Fontainbleau and at St. Cyr. He held that a disproportionate importance had been given to kings, their ministers and generals, and that it was necessary rather to study the people. In his Histoire des françois des divers étoys, ou histoire de France aux cinq dernieres siècles (10 vols., 1828-1844) he undertook to describe the different classes and occupations of the community. For this he made a collection of manuscripts, which he sold in 1835 (many of them passed into the library of Sir Thomas Philipps), drawing up a catalogue under the singular title of Traité de matières manuscrits de divers genres d'histoire. He boasted of having been the first to write really "national" history, and he wished further to show this in a memoir entitled L'Influence de l'Histoire des divers étoys, ou comment fût allée la France si elle eût eu cette histoire (1840; reprinted in 1841 under
the title: Les Français "pour la première fois dans l'histoire de France, ou poétique de l'histoire des divers états". Montel did not invent the history of civilization, but he was one of the first in France, and perhaps in Europe, to point out its extreme importance. He revised the third edition of his history himself (5 vols., 1848); a fourth appeared after his death with a preface by Jules Janin (5 vols., 1853).

**MONTEITH**, the name given to a large bowl, often made of silver, with a movable rim and scalloped edges, from which wine glasses, punch ladle, &c., could be hung, so that they might be cooled in the water with which it was filled. According to Anthony Wood (Life and Times, iii. 84, quoted in the New English Dictionary) the name was given to the bowl from a “fantastical Scot... Monseigneur Montegho who... wore the bottom of his cloak or coat so notched,” i.e. scalloped.

**MONTELEONE CALABRO**, a city of Calabria, Italy, in the province of Catanzaro, beautifully situated on an eminence gently sloping towards the Gulf of Sta Eufemia, 1575 ft. above sea-level, 70 m. N.N.E. of Reggio di Calabria by rail. Pop. (1901), 10,066 (town); 13,481 (community). It was almost totally destroyed by earthquake in 1783, but the French occupation it was inhabited and made the capital of a province. It suffered, however, considerably in the earthquake of 1905. The castle was built by Frederick II. The principal church contains some sculptures by the Gagini of Palermo.

Monteleone is identical with the ancient Hipponion, said to be a Lucran colony and first mentioned in 388 B.C., when its inhabitants were removed to Syracuse by Dionysius. Restored by the Carthaginians (379), occupied by the Bruttii (356), held for a time by Agathocles of Syracuse (284), and afterwards again occupied by the Bruttii, Hipponion ultimately became as Vibo Valentia a flourishing Roman colony, founded in 239 or 192 B.C. It was important as the point where a branch from Scolumium (Squillace) on the east coast road joined the Via Popillia. The harbour established by Agathocles proved of great service as a naval station to Caesar and Octavian in their wars with Pompeius Magnus and Sextus Pompeius, and remains of its massive masonry still exist at the village of Bivona on the coast, while the fort occupies the site of a temple. Its tunny-fish were famous. In the town itself there are remains of a theatre, of Roman baths (7), a mosaic pavement in the church of St. Leoluca (patron saint of Monteleone), and some Latin inscriptions. The town walls too of the Greek city can be traced for their whole extent, about 4 m. They are well constructed of regular parallelograms of a sandy tufa, laid in headers and stretchers. The Roman town occupied only a part of the Greek site, the portion occupied by the modern town, the streets of which still preserve the Roman arrangement. It was supplied with water by an aqueduct, the reservoir of which is situated at the village of Papagionti. The Capialbi and Cordopatri families have private collections of antiquities.

See V. Capialbi in Mem. Inst. (Rome, 1832), pp. 159 seqq.; F. Lenormant, La Grande-Grece (Paris, 1882), iii. 155 seqq. (T. As.)

**MONTÉLÍMAR**, a town of south-eastern France, capital of an arrondissement in the department of Drôme, near the left bank of the Rhone, 93 m. S. of Lyons on the railway to Marseilles. Pop. (1906), town, 9162; commune, 13,554. The ancient castle is not used as a prison. Remains of the ramparts and four old gates are also preserved. The chief public institutions are the sub-prefecture, the tribunal of first instance and the communal college. The industries include flour-milling, silk-throwing and spinning, and the manufacture of hats, lime, farming implements, preserved foods and nougat.

Montélimar was called by the Romans Accuminum. At a later period it belonged to the family of Adhémar and received the name Montel dell’Adhémar, whence the present name. Towards the middle of the 14th century it was sold by them partly to the dauphins of Viennois and partly to the pope, and in the next century it came into the possession of the Crown. During the religious wars it valiantly resisted Gaspard de Coligny in 1570, but was taken by the Huguenots in 1587.
